In October 2004, gladiators from around the world entered into a coliseum to battle over the future of the African lion, only it was not in Rome, Italy, but in Bangkok, Thailand, at CITES COP 13. It was one of the biggest circuses on earth, only there were people, countries and advocacy groups on show. If the potential to sustainably use Africa's wildlife and possibly timber as a catalyst for development were not so dependent on the outcome of CITES, taking a step back and observing human behavior, politics and maneuvering would be quite amusing. On one side were Western countries and Western urban-based animal rights groups using Western governments and developing world proxies such as Kenya, who had been bought off by these groups (e.g., IFAW) to support placing the charismatic African lion (*Panthera leo*) on Appendix I of CITES. These groups believed that controlled trade would protect the future of this species. In animal rights lingo this means "no trade", using Appendix I through various government signatories to find ways of eliminating if not stymieing trade in hunting trophies. Opposing gladiators were sustainable use groups, including community-based NGOs and hunting organizations along with African governments, who saw the conservation of the African lion through its sustainable management for economic purposes as the only hope of saving the African lion and its habitat.

As discussed above, addressing issues on the ground such as poverty, habitat loss, human-lion conflicts, problem lion control (PAC), "revenge killings" from rural people angered by lack of compensation for lost livestock or little or no benefits from the loss of critical dry season grazing lands to parks and hunting blocks will

³⁴⁴ Dr. Craig Packer. Distinguished McKnight University Professor, Dept. of Ecology, Evolution and Behavior, University of Minnesota, St. Paul, studying lions in Tanzania, including impacts of hunting, packer@cbs.umn.edu.

determine the future of lion populations in Africa, not stopping/limiting trade. In fact, there is no indication that regulated trophy hunting has ever jeopardized a lion population in Africa.

Kenya circulated a pre-proposal (KWS, 2004) for consideration at the 13th meeting of the October 2004 Conference of the Parties (COP 13) to the Convention on International Trade in Endangered Species (CITES) of Wild Fauna and Flora. This recommended transferring African populations of *Panthera leo*, the lion, from Appendix II to Appendix I. Currently, only the subspecies *P. leo persica*, which is extant only in India, is listed on Appendix I while the remainder of the species is listed on Appendix II under the higher taxon listing of Felidae.

Kenya feels that *Panthera leo* meets the Resolution Conf. 9.24 biological criteria for inclusion in Appendix I. There is an ongoing decline in the number of individuals in the wild [CITES Annex 1, Criterion C(i)], while threats from human settlements, disease, and over-exploitation through trophy hunting are evident [CITES Annex 1, Criterion C(ii)]. The populations of West and Central Africa are small, fragmented and decreasing in some areas [CITES Annex 1, Criterion A (i) and (ii)]. Kenya believes the species would benefit from an Appendix I listing by allowing the Conference of the Parties to consider and set export quota levels in accordance with Resolution Conf. 9.21 (KWS, 2004).

It is interesting to see this proposal coming from Kenya, which has a rather dismal track record for maintaining habitat, let alone wildlife populations. In Kenya, about 30 lion are shot each year as PAC animals, 15 in the Laikipia area. About 60-70 PAC elephant are taken each year; about 15 in the Laikipia area. All of these animals could generate huge amounts of income if linked to tourist safari hunting. In the nearby Abadare Mountains, plans existed for 1998 to cull over 25 lion in order to control their population (Powys, *pers. comm.*). This off-take will

likely worsen every year as human populations climb, encroaching on the habitat of lion, elephant and other species. The issue should not be the off-take but having adequate monitoring in place to assure its sustainability as discussed in Chapter 9. However, do not expect CITES to be practical. It is a political forum where ideologies clash for power.

By CITES Resolution Conf. 8.21, Kenya is required to advise the management authorities of the range states within which the species occurs of its intention to submit the proposal.

10.8.1 Kenya's Pre-Proposal

Kenya concluded the following:

10.8.1.1 Population status

Panthera leo is currently classified by the IUCN as vulnerable based on criterion C2a(i) (IUCN, 2003 *In: KWS, 2004*) meaning it faces “a high risk of extinction in the wild”; there is a continuing decline in the number of mature individuals (criterion C2a). According to an IUCN commission, there is not a single population of lions in West or Central Africa that is large enough to be viable: that is, around 100 breeding pairs, meaning between 500 and 1,000 animals in total. The two largest populations, in the Benoué area of Cameroon and on the Senegal-Mali-Guinea-Conakry border, are reported to have around 200 lions each. There are also about a dozen smaller populations, with around 50 lions each (Bauer & Van Der Merwe, 2004 *In: KWS, 2004*). All populations in West and Central Africa are small, fragmented and decreasing, even in some protected areas. A 2004 inventory of available information provides a conservative estimate of 16,500 to 30,000 free-ranging lions (Bauer & Van Der Merwe, 2004

In: KWS, 2004) in Sub-Saharan Africa: a decrease from a 1996 estimate of 30,000 to 100,000 free-ranging lions (Nowell & Jackson, 1996 *In: KWS, 2004).*

10.8.1.2 Threats

Kenya gave the causes for the population decline in the 1990s as increasing pressure from human settlements, disease (Canine Distemper Virus and Feline Immunodeficiency Virus, although the long-term effect of the latter virus is uncertain) (KWS, 2004) and political instability (Bauer & Van Der Merwe, 2004 *In: KWS, 2004*). Kenya claimed that research indicates that current trophy hunting levels and practices are unsustainable in some areas (Creel & Creel, 1997; Macdonald & Loveridge, 2003; Loveridge, 2004; Whitman, Starfield, Quadling & Packer, 2004 both *In: KWS, 2004*). Kenya argues that trophy hunting targets older males, which when killed are replaced in a pride by another male who kills all cubs nine months of age or less, such infanticide increasing the risk of population extinction (Whitman, *et al.*, 2004 *In: KWS, 2004*).

10.8.1.3 International trade

Kenya provided the following information on gross exports of *Panthera leo* for the past decade (UNEP-WCMC, 2004 *In: KWS, 2004*) (Tables 10.14 and 10.15).

Table 10.14: Export of lion hunting trophies from Africa, 1992-2002

UNEP/WCMC (2004) In: KWS, 2004) with permission, Jon Hutton Director, UNEP-WCMC

It should be noted that most lions exported from South Africa are captive bred and not really free-ranging wild lion, taken under what is called “canned hunting” conditions within fenced enclosures. Minor exports include skulls, plates, bodies, bones, skin pieces, other derivatives and live animals (UNEP-WCMC, 2006).

10.8.2 IUCN Classification of African Lion

According to Kristin Nowell, the “trade” specialist on the IUCN's Cat Specialist Group, in the IUCN Red List of Threatened Species, the Central Region lion population remains “vulnerable”, but the West Africa regional population is red

listed as “endangered”, not “critically endangered”. Cameroon’s lion population remains “vulnerable”. This information was to be published in November 2004 but was fully written up and made available for CITES COP 13 in October (Jackson, *pers comm.*).

Regarding Kenya’s lion proposal, Kristin Nowell (Nowell, 2004) of the IUCN/SSC Cat Specialist Group had the following to say,

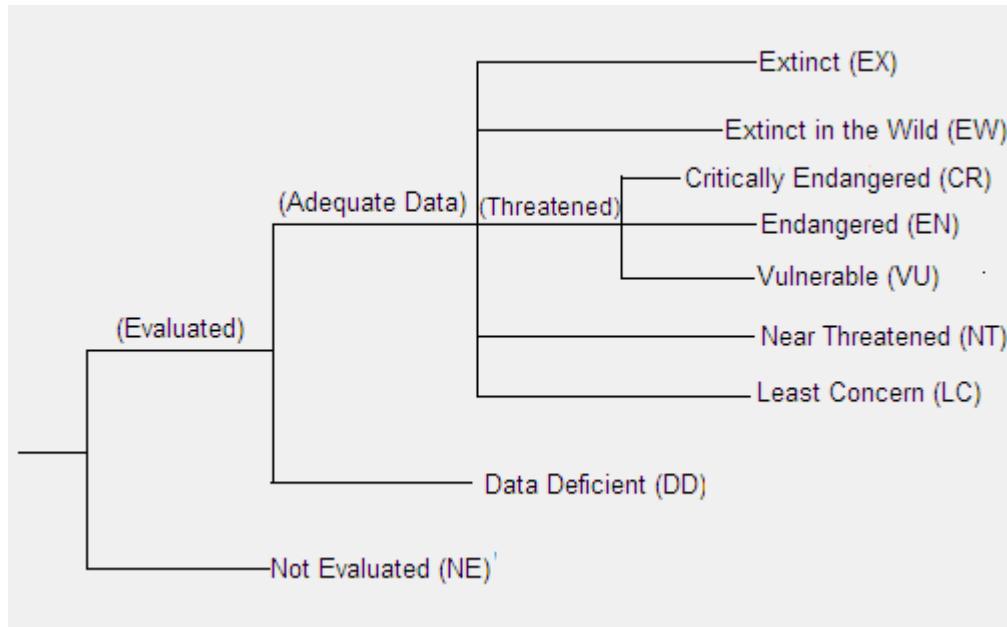

“I have just a couple things to add to support Craig (Packer) and Laurence's (Frank) comments...The first is that the (Kenya) proposal does not mention the primary threat: local people killing lions because they are problem animals. International trade is not a threat to the lion...The major international trade is in trophy-hunted animals, and trophy hunting is an important strategy for dealing with problem animals and providing economic benefits to local people living near lion populations. Transfer to Appendix I could jeopardize lion conservation by eliminating markets for trophy hunting. Despite Res. Conf. 9.21, which recommends that CITES parties permit import of approved Appendix I quota animals, some important importers still do not allow any commercial trade in Appendix I species because of domestic legislation. The main need in lion conservation is to develop strategies to enhance the lion's value to local people who may suffer depredation, and the proposal contains nothing to indicate that the current system of allowing range states to engage in controlled international trade in sport hunted trophies via CITES Appendix II is not working and should be changed.

The second is that the proposal relies on IUCN Red List information which will change in November 2004 when the 2004 Red List is released. I am attaching drafts of the new Red Listings from the IUCN/SSC Cat Specialist Group. The lion remains classified as Vulnerable, but under a different criterion. The regional population of West Africa is classified as Endangered. Again, although the cat conservation community is concerned about the status of the lion in West Africa, trophy hunting there is not considered unsustainable, and is indeed an important strategy for lion population recovery”.

10.8.2.1 Status of African lion, Vulnerable (VU A2abcd), Except Regional Population of West African

The IUCN will classify the African lion under the threatened category of vulnerable (VU A2abcd), except the regional population of West Africa, based on the following criteria as extracted from the IUCN (2000) and Baillie, Hilton-Taylor and Stuart (2004) (Figure 10.6). A taxon is vulnerable when it is not critically endangered or endangered but is facing a high risk of extinction in the wild in the medium-term future as defined by (Baillie, *et al.*, (2004)):

- Population reduction of at least 30% over ten years or three generations;
- Occurrence over less than 20,000 km² or occupancy less than 2,000 km², along with any of the two – 1) severely fragmented or known to exist at no more than ten locations, 2) continuing decline as indicated by extent of occurrence, area of occupancy, area/extent/or quality of habitat, number of locations of subpopulations, number of mature individuals and 3) extreme fluctuations indicated by extent of occurrence, area of occupancy, number of locations or subpopulations or number of mature individuals;
- Population less than 10,000 individuals and either 1) 10% decline over ten years or three generations which ever is longer and 2) continuing decline in mature individuals and population structure;
- Population very small or restricted in the form or either 1) population less than 1,000 mature individuals or 2) population has acute restriction in its area – typically less than 20 km² or found in less than 5 locations; and
- Probability of extinction in wild at least 10% within 100 years.

Source: IUCN (2000) with permission, IUCN.

Figure 10.6: IUCN species threat categorization

It should be noted that many species are still classified under 1994 Categories and Criteria (version 2.3) on the IUCN Red List, www.redlist.org (see latest categorization of tropical hardwoods by IUCN, Chapter 11, Section 11.11.6, Eco-Genocide in Southeastern Cameroon, the Forest People and the Dobi Dobi, More Parks and Protected Areas) (IUCN, 1994):

- Critically Endangered for A1 and A2, both $\geq 80\%$ population declines;
- Endangered for A1 and A2, both $\geq 50\%$ population declines;
- Vulnerable for A1 and A2, both $\geq 20\%$ population declines; and
- Current “Least Concern (LC)” was a sub-category under “Lower Risk (LR)” that contained sub-categories “Conservation Dependent”, “Near Threatened” and “Least Concerned”.

The following is extracted from what was published in November 2004 (IUCN, 2004a), “Change Of Criterion For ‘Vulnerable’ Classification Of The Lion, *Panthera leo*, In The IUCN Red List Of Threatened Species”:

“A species population reduction of approximately 30% is suspected over the past two decades. The causes of this reduction are not well understood, are unlikely to have ceased, and may not be reversible...The lion formerly ranged from Northern Africa through Southwest Asia (where it disappeared from most countries within the last 150 years), west into Europe, where it apparently became extinct almost 2,000 years ago, and east into India (where a relict population survives today in the Gir Forest (Nowell & Jackson, 1996 *In: IUCN*, 2004a). Most lions now occur in Sub-Saharan Africa. The most recent estimate of the population of the isolated Asiatic lion *P. leo persica* subspecies in the Gir Forest, India, is 327 (<http://www.asiatic-lion.org/news.html>)...

Previous experts have suggested the African lion population to total over 100,000 lions two decades (three lion generations) ago (Myers, 1975; Nowell & Jackson, 1996 both *In: IUCN*, 2004a). Current estimates of the population are 23,000 (range 16,500-30,000) (Bauer & Van der Merwe, 2004 *In: IUCN*, 2004a) and 39,000 (range 30,000-47,000) (Chardonnet, 2002 *In: IUCN*, 2004a) (Table 10.16). This implies steep rates of decline (approximately 60-75%), a scenario not well supported by the regional population trends...It is likely that previous population estimates were too high, and a 30% rate of decline over two decades is suspected to be more accurate, with most lions being lost from West and Central Africa. It is possible that the rate of decline may be less, but the precautionary principle precludes removing the lion from the list of Threatened Species”.

“Approximately 30% of the individual population estimates compiled by the African Lion Working Group were based on scientific surveys and 70% were derived from expert opinion or guesstimate” (Bauer & Van der Merwe, 2004 *In: IUCN*, 2004a).

The second survey was carried out by Philippe Chardonnet and sponsored by the International Foundation for the Conservation of Wildlife and Conservation Force (Chardonnet 2002 *In: IUCN*, 2004a):

Table 10.16: Comparison of African lion population estimates by two recent surveys

Region	Estimated - ALWG ¹	Estimated - IGF ²	Minimum - ALWG	Minimum - IGF	Maximum m - ALWG	Maximum - IGF
Western	850	1,163	450	968	1,300	1,358
Central	950	2,815	550	2,092	1,550	3,538
Eastern	11,000	15,744	8,000	11,268	15,000	18,811
Southern	10,000	19,651	7,500	14,526	12,500	23,425
Total	23,000	39,000	16,500	29,000	30,000	47,000

1.ALWG = African Lion Working Group survey (Bauer & Van der Merwe, 2004 *In:* IUCN, 2004a)

2.IGF = International Foundation for the Conservation of Wildlife survey (Chardonnet, 2002 *In:* IUCN, 2004a)

Source: IUCN (2004a) with permission, IUCN

“He compiled estimates for 144 individual African lion populations, grouped into 36 largely isolated sub-populations. About 63% of Chardonnet’s (2002 *In:* IUCN, 2004a) individual population estimates were based on expert opinions or guesstimates. Twelve percent (12%) were based on scientific surveys, and a further 25% were derived from extrapolation of variables from nearby populations and catch-per-unit effort-estimates based on lion trophy hunting”.

Both Chardonnet (2002 *In: IUCN*, 2004a) and Bauer and Van der Merwe (2004 *In: IUCN*, 2004a) conclude that 90% of the continental lion populations are found in East and Southern Africa, similar to findings of the IUCN/SSC Cat Specialist Group's Cat Action Plan in the early 1990s (IUCN, 2004a).

Chardonnet (2002 *In: IUCN*, 2004a) estimates that 39% of West African lion populations and 53% of Central African lion populations are declining, while the declines in Southern Africa and East Africa are much lower, at 11% and <1%, respectively. Overall, Chardonnet (2002 *In: IUCN*, 2004a) describes 25% of the individual lion populations as currently declining. Bauer and Van der Merwe (2004 *In: IUCN*, 2004a) describe the lion populations in East and Southern Africa as stable over the last three decades, while those in West and Central Africa are small and isolated.

Chardonnet (2002 *In: IUCN*, 2004a) "estimates current lion range at approximately 3 million km², with about half having some form of protection, from national park to hunting reserve. Overall, habitat for 18% of African lion populations is described currently as declining. The highest rate is in West Africa (39%), with lower rates for Central (18%), Southern (16%) and East (9%)".

10.8.2.2 West African lion, November 2004 IUCN Red List release, Endangered (EN C2ai)

The following is extracted from what was published in November 2004 (IUCN, 2004b), "Endangered Classification For The Lion, *Panthera Leo*, Regional Population Of West Africa" in the IUCN Red List Of Threatened Species.

"The number of mature individuals in West Africa is estimated by two separate recent surveys at 850 (Bauer & Van Der Merwe, 2004 *In: IUCN*, 2004b) and 1,163 (Chardonnet, 2002 *In: IUCN*, 2004b). Chardonnet (2002 *In: IUCN*, 2004b) estimated that 39% of the individual lion populations in West Africa are currently declining.

Both surveys find that West African lions constitute approximately 3% of the Sub-Saharan African lion population. Chardonnet (2002 In: IUCN, 2004b) estimates West African lion range at approximately 121,980 km² (4% of the continent's total lion range). The African Lion Working Group (Bauer & Van Der Merwe, 2004 In: IUCN, 2004b) finds that West African lions are restricted to protected areas (parks and hunting reserves), while Chardonnet (2002 In: IUCN, 2004b) estimates that one-third of the population may be found outside protected areas. Lions in West Africa are grouped into three isolated sub-populations by Chardonnet (2002 In: IUCN, 2004b) and approximately seven by the African Lion Working Group (Bauer & Van Der Merwe, 2004 In: IUCN, 2004b). Chardonnet's (2002 In: IUCN, 2004b) three sub-populations consist of 18 different individual populations, between which there may be some interchange of individuals, although this is unknown. There is disagreement over the size of the largest individual population in West Africa: the African Lion Working Group (Bauer & Van Der Merwe, 2004 In: IUCN, 2004b) estimates 100 lions in Burkina Faso's Arly-Singou ecosystem, while Chardonnet (2002 In: IUCN, 2004b) estimates 404 for the same area. Overall, both surveys found that just 5% of their West African individual lion population estimates to be of scientific quality, with the remainder being more rough and less reliable.

Three West African countries allow lion trophy hunting by tourists: Burkina Faso, Benin and Senegal. Analysis of the CITES trade database kept by UNEP-WCMC for the 1990s shows an average of 18.5 lion trophies per year were exported from the region. Burkina Faso is the primary country for trophy hunting. A stable number of 12 lions per year have been hunted there over the past two decades.

Participants at a 2001 African Lion Working Group workshop on West and Central African lions identified the following threats: habitat loss to agriculture and timber operations; habitat degradation and fragmentation due to the movements of local pastoralists and their livestock; and poaching of lions to prevent and retaliate against predation, as well as for traditional cultural practices. They recommended establishment of a low-cost regional lion population monitoring network; raise awareness among donors and decision makers of lion conservation problems; involve and support local communities in management of problems related to lions; build capacity of local managers to conserve lions;

organize a training workshop for lion survey methods; and organize lion surveys for priority areas in each country (Bauer, De Iongh, Princee & Ngantou., 2001 *In: IUCN*, 2004b) ”.

10.8.3 Responses From Lion Researchers of the African Lion Working Group (ALWG)

The following are comments made from various members of the African Lion Working Group (ALWG) undertaking lion research in Africa on the Kenyan CITES proposal through email communication as provided by Dr. Paul Funston, Department of Nature Conservation, Tshwane University of Technology, South Africa.

10.8.3.1 Dr. Paul Funston

The following summarizes a submittal to the Department of Environmental Affairs and Tourism, South Africa by Dr. Paul Funston at their request (Funston, *pers. comm.*). This input largely reflects the official position of the South African government on the Kenya lion proposal (DEAT, 2004b). The biggest threat to lion in Africa is conflict with pastoralists and farmers along with concurrent Problem Animal Control (PAC).

The Nowell and Jackson (1996) estimate of 30,000 to 100,000 lions was a guess and not the result of a systematic survey. Of the two systematic surveys (Bauer & Van der Merwe, 2004; Chardonnet, 2002 both *In: Funston, 2004*), the population is estimated to be between 16,500 and 47,000. The Bauer and van der Merwe (2004 *In: Funston, 2004*) estimate is widely recognized as an underestimate; with the actual lion population probably being 30,000. Chardonnet (2002) is probably the most comprehensive and reliable. It cannot be concluded from existing

information that there have been any shifts in lion population numbers over the last decade.

Income generated from eco-tourism and hunting makes an important contribution to conservation of lions and lion populations. The loss of hunting from placing the lion on Appendix I could result in many hunting areas being abandoned and left for encroachment by humans and their livestock, while eroding the buffer role they play in protecting lion populations within parks. There is no good evidence that trophy hunting of lion has threatened any population with extinction, though in certain areas it has led to changes in population structure. Although the hunting of older males may increase infanticide rates, this has not been shown in field studies, with lion populations breeding at similar rates in harvested and non-harvested populations. Researchers are working with the hunting community to adopt guidelines and indices to assure trophy hunting of lion is sustainable with minimal impact on population dynamics.

Feline Immunodeficiency Virus (FIV) is of no threat to lion populations and should not even be mentioned in this context, being used as an alarmist approach designed to fool those without knowledge and drawing on the human experience with HIV. Even the Canine Distemper Virus (CDV) outbreak of the early 1990s in the Serengeti was a unique occurrence with a mutated virus, with the outbreak affecting 30% of the Serengeti plains population that recovered soon thereafter.

Although high, about 95% of South Africa's trophy hunted lions are ranched or "canned" lions, the hunting of which has no influence on the free-ranging populations. However, it is contributing to a ground swell of international anti-hunting sentiment, which could be devastating for wild populations outside of protected areas in the rest of Africa, if other African countries follow Botswana's inappropriate example of shutting down lion hunting (see Chapter 9, CBNRM,

Section, 9.6.3.4, Botswana Community Trust Program) or if lions are upgraded to Appendix I. The other country with high numbers of trophy hunted lion, Tanzania, has 250,000 km² (about 25% of its land mass) set aside for hunting concessions. At five lions/100 km² this would translate to a population of 12,500, which is not very far off the upper estimate of Chardonnet (2002 *In:* Funston, 2004) of 11,852 lions in Tanzania. Considering that only the Serengeti population of about 4,500 lions is not exposed to trophy hunting, this suggests that the average number of trophy hunted lions from 1992 –2002 (235/year), is harvested from a population of 7352 – 8000 lions. This equates to only 3% of the population being killed each year, which has been determined to be sustainable (Creel & Creel, 1997 *In:* Funston, 2004).

Thus, there is no good evidence to suggest that lions meet the biological criteria for elevation to Appendix I of CITES or that by placing them on Appendix I, their population status would be enhanced. In fact, the opposite would likely occur since by taking away from their economic value, there would be a disincentive by both the safari industry and rural communities to conserve lion and its habitat, resulting in further population declines. Kenya's banning of safari hunting has been disastrous to lion and other wildlife populations and their habitat. Kenya is dictated to by foreign NGOs and animal rights groups whose motives are questionable and whose ecological knowledge and understanding of the outcomes of these policies is clearly lacking (Funston, 2004).

10.8.3.2 Dr. Lawrence Frank

There is no evidence that FIV has anything to do with lion health in the wild. There is no evidence that trophy hunting, even where badly managed, has been responsible for lion declines. In Kenya, there has been no trophy hunting for 27 years, yet lion populations have declined drastically.

Problem Animal Control (PAC), whether by government or individuals, has decimated lion populations in most of Kenya (see Packer quote, beginning of 10.8, THERE'S AN AFRICAN LION JUST AROUND THE CORNER). Even in Kenyan Maasailand, which used to have a major lion population, "revenge killing" has driven at least one lion population (Chyulu Hills) virtually to extinction in about three years (also see Chapter 9, Section 9.7.8.2, "Politics of despair", Southern Maasailand "Tarangire Ecosystem" and Chapter 11, Section 11.11.9, Kenya Wildlife Service (KWS) – Living on donor handouts, negative impact on Kenya's wildlife outside parks). This is probably happening in many other parts of Kenyan Maasailand. There are rumors of a similar increase in killing in the Mara region. In northern Kenya, very little is known due to insecurity, but by all accounts lions are spread so thinly, are so heavily persecuted and have so little wild prey that they are not likely to last much longer. Lions are disappearing outside of parks in Kenya simply because they have only negative value and are thus expensive pests. Only trophy hunting can give these animals positive value. Kenya will lose nearly all its lions outside of parks unless trophy hunting is reinstated. Legislation, which discourages trophy hunting, will merely hasten the disappearance of lions where they still exist in viable numbers. Meaningful regulation would impose much more stringent protection in countries with highly fragmented, small populations (e.g. West Africa). He believes that backed by the animal rights groups, this proposal is an effort to head off any attempt to renew hunting in Kenya as the government is about to finally attempt to change the legislation to allow ownership and some sort of consumptive use of wildlife (see Chapter 11, Section 11.11.9.6, Kenyan conservation at a crossroads). Laikipia (7,000 km²) would be an ideal place for experimental lion hunting as it has a well-studied and healthy population of roughly 200 lions that already sustain a PAC mortality of about 20%. The Laikipia Wildlife Forum is well managed and cooperative (Frank, 2004).

10.8.3.3 Dr. Craig Packer

Tanzania as a whole has 10,000 - 15,000 lions making it premature to conclude that lions are declining at an alarming rate. The Serengeti lion population (one of the largest in Africa) is probably at its highest level since the 1880s. There has been no hard data presented that trophy hunting is damaging to lion populations. His recent article in *Nature* showed that trophy hunting can be regulated with minimal impact on lion populations. No decline in lion populations has ever been shown to directly result from trophy hunting. Problem Animal Control (PAC) and “revenge killing” by pastoralists living in the vicinity of protected areas and habitat loss are the key factors impacting lion populations. In northern Tanzania, PAC is an order of magnitude higher than trophy hunting in impacting on lion populations. There is no evidence that FIV can be linked to declining lion populations, with all the healthiest lion populations having high levels of infection, and genetic data indicating that the virus has been in these populations for 1000s of years (Packer, 2004).

10.8.3.4 Dr. Luke Hunter

Kenya has essentially failed to protect lions outside protected areas despite its long ban on trophy hunting. This is a unique opportunity to experimentally restore hunting to those areas where PAC is wiping out lions that come with very clear conservation stipulations. Renewal of the concession would be based on monitoring and an increasing/stable lion population (Hunter, 2004).

10.8.4 Initial Responses from African Countries

10.8.4.1 South Africa

“*Panthera leo* does not meet the biological criteria [CITES Annex I, Criterion C 9(i) or (ii)] for inclusion in Appendix I. It seems that human-animal conflict seems to be the most important threat and this can only be addressed at a national level” (DEAT, 2004b). Note: “Criterion C (i) or (ii)” believed to be the correct citation.

10.8.4.2 Namibia

“As the proposal rightly indicates, the principal threats to the lion population are increasing pressure from human settlements (i.e. loss of range) and possibly disease. Neither of these threats will be addressed through an Appendix I listing, and in fact, such listing will most likely exacerbate the loss of range, through increasing intolerance for lions outside of formally protected areas. We feel that the conservation of the African lion will be better served through initiatives at national level to address specific threats. In conclusion, we believe that the argument and supporting data are not sufficiently robust to justify a global transfer to Appendix I. More specifically, the lion population of Namibia does not meet the criteria for an Appendix I listing, and should be excluded from any such proposal” (Lindique, 2004).

10.8.5 Risks if Lion is Placed on CITES Appendix I

“The Appendix I listing of African lion would require importing nations to issue import permits, which are not required of Appendix II species. The U.S., E.U., Australia, etc. have ‘stricter domestic’ legislation and practices when a species is listed on Appendix I...A ‘CITES quota’ is only a ‘recommendation’ and is given no legal weight in the USA. The USA (where the majority of lion hunters come from) still must make its own independent non-detrimental determination, though it may consider the information used or relied upon by the parties of CITES in setting a quota. The U.S. makes its own biological non-detrimental finding on a country by country, and year by year basis before it permits the importation of Appendix I species. If there is not sufficient information, it is prohibited from issuing an import permit. If it

finds the taking of the animal is not detrimental, its information and judgmental basis of its finding is subject to disclosure and judicial review by any ‘citizen’ or organization” (Jackson, 2004a).

Threatened with lawsuits by various interests groups

“permit applications are often shelved indefinitely by government bodies such as the U.S. Fish & Wildlife Service (USF&WS). The burden of proof is on the applicant, not the USF&WS (government). It is also administered as a ‘low priority’ - literally, taking years and 100s of 1,000s of dollars in legal services to process the initial import permits through the non-detriment determination stage (by the interested parties, not government). The cost of gathering and providing the biological data is often, if not normally, cost prohibitive and often beyond the state of the art” (Jackson, 2004a).

As has been seen, the USFWS often takes “stricter domestic measures” for CITES Appendix I species/populations, using continually moving “goal posts” requiring countries to demonstrate “enhancement” that is never achieved. This could effectively end hunting as a conservation and development tool of the African lion in many Sub-Saharan countries (see Section 10.7.2, “Enhancement” Requirement Under the United States "Endangered Species Act").

The swords are drawn, the two opponents circling, each searching for the other’s weakness. Who will win? Does right make might or is it about who has the most cash, prostitutes and other favors to hand out? Or is it about the more economically and militarily powerful West continuing to impose its value systems, often hypocritical, on the developing world? The same old, same old, where Africa as usual, along with its people and wildlife comes out the loser; the giant trouncing the ill prepared midget! Time will tell!

On October 11, 2004 Bangkok, Thailand at CITES COP 13 at an unexpected night session of Committee 1 on Monday at 8:55 PM, Kenya withdrew its lion proposal after a one and one-half page statement. There will be no uplisting or

split listing, nor need for an Animal Committee review or Significant Trade (SIG) Review. There is an unwritten understanding to hold a series of regional workshops and Kenya implied that this is not over with - just the first round (Jackson, 2004b.). Kenya had neither the backing of the key lion researchers (e.g., Packer was on the Tanzanian CITES delegation) nor the African range states, especially SADC countries, only the Western animal rights movement. The battle was won, but the ideological war between the urbanized West and resource dependent Sub-Saharan Africa is far from over.

Things are beginning to change in favor of sustainable use. At CITES COP 12 in 2002, Tanzania's leopard quota was doubled from 250 to 500 (CITES, 2002). At Cites COP 13 in Bangkok, Thailand, Namibia's leopard quota was increased from 150 to 250/year and South Africa's increased from 75 to 150/year. For the first time, South Africa and Namibia were each accorded five black rhino, the first time in several decades this species has been approved by CITES (CITES, 2004; SCI, 2004). Of course that does not mean that the USFWS will allow the black rhino, Endangered on the U.S. Endangered Species Act (ESA) list, into America (ESA, 1999). At COP 14 in June 2007, CITES approved the sale of elephant ivory exports from Botswana (20 tons of ivory), Namibia (10 tons) and South Africa (30 tons) that had been approved in 2002, but conditional upon the adequacy of Monitoring of Illegally Killed Elephants (MIKE). MIKE was determined to have been adequate (CITES, 2007a). This is also linked to a once off sale of ivory on top of this 60 tons from Botswana, Namibia, South Africa and Zimbabwe of all government-owned stocks that have been registered and verified as of 31 January 2007,

"of a single shipment per destination and may only go to countries whose internal controls on ivory sales have been verified as being sufficient by the CITES Secretariat...no new proposals for further sales from these four countries are to be considered by CITES during a 'resting period' of nine years that will commence as soon as the new sales have been completed" (CITES, 2007b).

The only major change at CITES COP 14, June 2007 is a doubling of the leopard quota in Mozambique from 60 to 120 and a new quota for Uganda of 28 trophy hunted leopard (Belinfanti, 2007). The real issue comes down not so much to trade but to where the profits go from the sales of these quotas. As stated, it is the people living on the land with wildlife who will determine its future. The question is how to give them a vested economic and cultural stake in its future?

10.9 CONCLUSION

The Convention on International Trade in Endangered Species (CITES) and the U.S. Endangered Species Act (ESA) have been tools used by the West to control and manipulate conservation and economic development based on the sustainable use of Sub-Saharan Africa's mega-fauna, which until the arrival of European colonizers in the 1500s had co-evolved in harmony with humans. The very people, who destroyed the lives of Africans and American Indians through colonization and the use of their wildlife as tools of conquest, now live in Western urban settings and no longer directly depend on living off of nature to survive. Within their society have evolved groups which pay homage to and worship wildlife, almost as a false god; the Western urban-based animal rights movements such as the Humane Society of the United States (HSUS), International Fund for Animal Welfare (IFAW), People for the Ethical Treatment of Animals (PETA) and the Defenders of Wildlife, among others. They and the Western governments, which they influence and/or infiltrate, believe that they know how to best conserve wildlife through controlling trade and by application of the "precautionary principle", which sends Western researchers to study Sub-Saharan Africa's fauna, while its people live in misery and in trying to survive are rapidly eliminating wildlife and its habitat.

Sub-Saharan Africa's approach has been "adaptive management" as described in the last chapter linked to generating economic value from wildlife as one incentive to conserve both habitat and species. This concept is in its infancy and still evolving, having been around for only about 20-30 years. Unfortunately, the idea of shooting a few (1-5% for trophies, 12-25% of the annual population for meat depending on the species) in order to give value to wildlife and its habitat to people still living off the land and who must decide, do they keep the wildlife/habitat or do they convert it into human-made systems (e.g., farms and pasture for livestock), disturbs these urban-based elites. Yet, let us take these once-removed Western urban dwellers into the forests of Cameroon or the other wilds of Africa, with nothing but the shirts on their backs and they too, within a week, will begin hunting and gathering and they too will conclude that the elephant that eats their crops and the cheetah that kills the game and livestock they are trying to live from must go, unless that elephant and cheetah provide them with a livelihood and help them survive, that is until they are no longer competitors for survival or liabilities, but assets.

CITES and the ESA assume regulation through controlling trade will save "endangered species", some of which are far from being endangered on a continental and regional basis such as the African elephant. Meanwhile, the issues that are leading to the demise of elephant and most wildlife in general have little or nothing to do with trade and must be dealt with on the ground: 1) poverty, 2) failed centralized management systems, 3) inappropriate governance, 4) corruption at all levels of society, 5) lack of perceived ownership of natural resources by rural communities, 6) lack of adequate benefits (economic and cultural) to rural communities from elephant and other wildlife, 7) human and livestock populations that have increased up to 6.5 times or more during the 20th century, displacing wildlife and its habitat, 8) resulting habitat loss, 9) the

bushmeat trade, 10) inadequate alternative livelihoods (e.g., urbanization and industrialization) to take pressure off the rural resource base.

In all frankness, the average, little guy on the ground, has never heard of CITES and the ESA and could care less about them. Unlike the “fat and happy” Western urban elites, he is in a survival mode. He doesn’t have the luxury to think about conservation unless it is a “utilitarian conservation” that helps him and his family survive. As Andrea Turkalo, a researcher with Wildlife Conservation Society (WCS) in Dzanga Sangha National Park, Central African Republic,

“People in the forest live in such poverty that they do not have time to think about animal conservation...‘This country can’t run their health dispensaries. They can’t educate their children. How can you expect them to think about conservation?...’ ” (Tomlinson, 2007).

It is not controlling trade, which will endear him to wildlife or cause him to conserve endangered species. However allowing him to sustainably use endangered species and other wildlife as part of a rural portfolio needed for survival and development may provide a glimmer of hope that attitudes towards wildlife will change from viewing it as a short-term to a long-term resource. Then wildlife and its habitat have a chance of surviving.

When the issue is trade, very often CITES and the ESA have the opposite impacts that are desired by 1) creating black markets, which cannot be regulated as opposed to controlled trade, 2) causing the land owner to shoot, shovel and shut-up, eliminating his perceived competitor and/or 3) the conversion of wild areas of little perceived value into farms or overgrazed pasture. Of special significance is trophy hunting of the African elephant (threatened on the ESA) and species like the cheetah (endangered on the ESA), but which has healthy populations in some countries, especially Namibia, and black rhino (endangered on the ESA). CITES

trophy hunting quotas exist for these species in some countries. Because of their listing on the ESA as “endangered”, the cheetah and black-faced impala in Namibia, the black rhino in Namibia and South Africa, and the leopard in West, Central and North Africa are not allowed into the USA. The U.S. also uses “stricter domestic measures” linked to the ESA to stop countries where the elephant is on CITES Appendix I (e.g., Cameroon) from coming into the USA.

If America and Europe want to save endangered species and other wildlife, they are “missing the boat”. They need to go after corrupt governments, governments who refuse to devolve ownership of natural resources to the landowners – rural Africans. The West must look at itself, plundering Sub-Saharan Africa’s raw resources, when it could take pressure off of wildlife and its habitat by transforming these products in Sub-Saharan Africa, helping to create an urban middleclass. Finally, they need to assure a critical mass of educated youth from these rural areas, which as described under CBNRM (Chapter 9) have the ability to manage and market wildlife for their people in order for rural communities to obtain the added value of wildlife on the international market. When wildlife starts putting food on the table, building needed infrastructure (e.g. schools, clinics, boreholes, etc.), when people’s cultural needs are reintegrated into the management of wildlife, and they see it as helping to improve their physical and spiritual quality of life, then wildlife might have a chance of surviving the 21st century. Trying to save endangered species through controlling trade via CITES and the ESA, results in nothing more than “feel good” policies, that actually do more harm than good for Africans and Sub-Saharan African wildlife. Ultimately, as currently implemented CITES is a slap in the face to the 1980 World Conservation Strategy (OECD, 2003) and the updated version *Caring for the Earth: A Strategy for Sustainable Living* (IUCN/UNEP/WWF, 1991) that while supporting the preservation of genetic diversity, also encourage sustainable use of natural resources to the benefit of mankind.

Chapter 11

11.0 “INDEPENDENCE”, “DEMOCRACY” AND FOREIGN AID DEPENDENCY, IMPACTS ON CONSERVATION AND DEVELOPMENT IN SUB-SAHARAN AFRICA

“Let us remember that the main purpose of foreign aid is not to help other nations but to help ourselves” (President Richard M. Nixon, 1968 *In: McCully*, 2001).

“Yet most foreign aid is not about beneficence, but about power...powerful institutions encode their doctrines and impose them on the less powerful...since 1980, as aid doctrines and coercive practices have intensified in Africa, rates of recorded growth have turned negative and rates of progress in well-being have declined...The aid system can be made to change – but only if publicly shamed, prodded and cajoled into doing so...Posing as a solution, foreign aid has become a problem...a supporting actor masquerading as a star” (Sogge, 2002a).

“Between 1960 and 1986, the Western donors spent US\$ 116 billion in Sub-Saharan Africa (SSA). Better used, that might have been plenty. A lot went back to donors, paid out to experts for dubious advice. Africans stole some and wasted some more. Some of it went to badly conceived projects which ruined good land and dispersed productive societies. And even more went to prop up corrupt, tyrannical and simply inefficient governments” (Rosenblum & Williamson, 1990).

The next three chapters on foreign aid, subsidies/structural adjustment (SAP)/debt relief and the private sector in Sub-Saharan Africa, deal with how the West has related to post-independent Sub-Saharan Africa and the impacts this is having on sustainable development and the natural resource base. These chapters also begin to look at the way forward, which will be discussed in the final chapter of this book.

11.1 WINDS OF CHANGE

These famous lines, “Winds of Change”, by British Prime Minister Harold Macmillan came easily to the Francophone countries where there had been a small European presence, but strong cultural and educational ties with France. By 1960 only Guinea-Conakry chose to take independence and break its ties to France, while the remainder of the countries (e.g., Senegal, Mali, Upper Volta, Congo Brazzaville, Chad, the Central African Republic, Cameroon, etc.) took independence while remaining part of the French community tied to a common currency. However, change was often hard in coming to the white settler colonies such as Kenya, Southern Rhodesia (today's Zimbabwe) and South Africa. The Portuguese colonies, until the 1930s, had a colonial policy of “exploitative neglect”, where Africans were left alone. However, following WWII, Portugal encouraged European settlement, creating a situation where Africans were kept in near servitude with little opportunity for an education and socio-economic advancement. The Portuguese government, itself a dictatorship, saw its colonies as provinces and refused to give them up to independence, resulting in an armed struggle in Angola by 1961, Guinea-Bissau by 1962 and Mozambique by 1964, while Portugal spent half its annual budget on military control of its colonies. This resulted in an anti-colonial feeling back home and eventually a coup *d'etat* in April 1974 with a more reform minded military regime, which abruptly gave Guinea-Bissau independence by 1974, followed by Mozambique and Angola in 1975 (Martin & O'Meara, 1995).

11.2 END OF COLONIALISM

Lowenthal (1997 *In:* Griffiths & Robin, 1997) believes that,

“Lands long given up to imperial enterprise suffer by imperial withdrawal for two related reasons. Unless their economies remain neo-colonial, they are ill equipped to bear the loss of habitual modes of employment. Nor can they rapidly overcome habits of dependence ingrained by long subservience to the will as to the interest, of others. The plight of ex-imperial Africa today exemplifies these problems”.

11.2.1 Educational Status of Sub-Saharan Africa at Independence, an Impediment to Progress

Prior to 1945, less than 1% of the African population had full political and civil rights. Education was available to less than 5% of the population (Martin & O’Meara, 1995; Leistner, 2004). As noted, a small black elite was educated at a higher level. In the Francophone colonies, they were accorded the full rights of citizens, but had to accept *assimilation*, rejecting their heritage, family law and customs, to become black Frenchmen (Meredith, 2004) (see Chapter 3, Section 3.1.4.1, Francophone colonial Africa).

In the late 1950s, just as independence began, Sub-Saharan Africa with a population of 200 million had only 8,000 secondary school graduates, half of which came from Ghana and Nigeria. Only 3% of the student age population obtained a secondary education and 33% a primary education. French colonies had no universities. More than 75% of the manpower in government and private business were foreigners (Meredith, 2004). Just after independence in 1965, Zambia had only 100 university graduates, 1,500 people with a full secondary education and 6,000 with two years of secondary school (Dumont, 1966). Some

countries like Belgium had an ant-education policy with the slogan, “no elites, no problems”, not changing until 1955 (Dumont, 1966). In the Congo Belge, the majority of the population was afforded a primary education only, with secondary training available only at Catholic seminaries (Meredith, 2004).

In many cases, the peasants had been trained to obey rather than think and understand the purpose of their work, resulting in a major constraint to continued development in the post-independent period (Dumont, 1966). Even in the 1990s, when the principal author lived in Nairobi, an exchange student from America at the University of Nairobi explained how testing was undertaken based on rote memorization as opposed to testing one’s ability to understand, conceptualize and think; remnants of the colonial era. The lecturer would read from notes, close his book and walk out with little or no discussion or exchange with students. Leistner (2004) believes this form of education must change in Sub-Saharan Africa if it is to compete in a fast moving global society.

Sub-Saharan African countries were expected to transition smoothly from colonialism to independence, running sophisticated Western governments and economies with a “thin shell of educated” people (Dumont, 1966). Neither British Prime Minister Harold Macmillan nor Colonial Secretary Iain Macleod believed that Sub-Saharan African colonies were ready for independence, most being poorly educated, economically weak and ill prepared. However much they feared the advance of communism, to drive nationalism back would be to drive it into the hands of communism (Meredith, 2004).

11.2.2 Economic Viability of Sub-Saharan African Countries at Independence

The first President of Senegal, Leopold Senghor, was against the two French federations [French West Africa and French Equatorial Africa/*Afrique*

Équatoriale Francaise (AEF)] being broken up, fearing that as independent countries they would be too small, divided and therefore, dependent. This is just what France desired, not intending to permit federations of African territories to develop “with enhanced powers, capable of wielding significant influence in the metropolitan parliament” (Meredith, 2004). René Dumont (1966) was worried by what he called the balkanization of Africa, i.e. the creation of many countries, each with its own governmental administration that would hamstring the continent, destining it to failure as the resource bases and economies of African states were too small for each to sustainably support Western state bureaucracies, left behind as a result of colonialism. Attempts at industrialization through import substitution failed, as any one country’s market was too small to achieve economies of scale (Meredith, 2004) (see Chapter 12, Section 12.7.1.1, Import substitution and Section 12.9.3, Role of Sub-Saharan African Governments in Diversification through Industrialization). René Dumont (1966) gave an example of Gabon with 450,000 inhabitants having 65 deputies, or one each to 6,000 people compared to one per 100,000 in France. A deputy in Gabon was paid more than a British member of parliament and earned in six months as much as the average peasant did in 36 years (Dumont, 1962 *In:* Meredith, 2004). The majority of national budgets went to salaries, leaving little left over for actual development or functioning of bloated bureaucracies representing a small elite in relation to the total populations of these countries. In 1964, examples of the percentage of national budgets going to civil service salaries were (Meredith, 2004):

- 47% in Senegal;
- 58% in the Central Africa Republic and the Ivory Coast;
- 62% in Congo Brazzaville; and
- 65% in Dahomey (Benin).

Leistner (2004) raises similar concerns with national economies, often no bigger than a European municipality, unable to afford the essential elements of modern states including legislatures, government machinery, foreign embassies, independent currencies and armies. Economies of scale then become a problem. What finances were left over were often abused by these elite. In 1964, in 14 Francophone countries, more was spent on importing alcoholic drinks than importing fertilizer (Meredith, 2004).

11.3 NEO-IMPERIALISM IN SUB-SAHARAN AFRICA

Imperialism, as defined by Webster (1989), is a

“Policy forming and maintaining an empire in seeking to control raw materials and world markets by conquest of other countries, establishment of colonies and seeking to dominate economic and political affairs of underdeveloped areas or weaker countries”.

During the pre-colonial period in Sub-Saharan Africa, European traders using superior military power extracted monopolistic trading rights from chieftains and kings in a pattern of trade based on plunder. During the colonial period, this continued with extension of sovereign control of one state over another. Postcolonial imperialism has been based on economic control from afar through international organizations and treaties capable of steering the economies of the ex-colonial territories indirectly and safeguarding the proprietary interests of foreign investors, while generating a new pattern of extraction through resource bondage, technological rents and debt-peonage (Hoogvelt, 2002 *In: Zack-Williams, Frost & Thomson, 2002*).

Capitalism, as defined by Webster (1989), is an economic system where most of the production and distribution (e.g., land and factories) is privately owned and operated for profit, a concentration of wealth is invested into the growth of great

corporations and there is an increase in government control. Imperialism is an agenda of capitalism in which wealth from some areas, groups or people benefits from the transfer of economic surpluses and hence, the under-development of other areas, groups and peoples (Hoogvelt, 2002 *In: Zack-Williams, et al.*, 2002).

Jules Méline, the French protectionist Minister of Agriculture, on March 8th, 1899, wanted

“to discourage in advance any signs of industrial development in our colonies, to oblige our overseas possessions to look exclusively to the mother country for manufactured products, and to fulfill, by force if necessary, their natural function, that of a market reserved by right to the mother country’s industry” (Dumont, 1966).

The more things change, the more they remain the same.

Although direct control through political colonialism largely ended by about 1960 in much of Sub-Saharan Africa, the West began using economic relations to indirectly control Sub-Saharan African politics, economies and access to Sub-Saharan African resources. Neo-imperialistic tools and policies, such as foreign aid and structural adjustment (SAP), were used to continue meeting Western capitalistic demands, as opposed to exporting capitalism to the developing world (see Section 11.6.7, Foreign Aid and Puppet Governments – “Donor Democracy”). As a result, the West developed economically, while the developing world continued to spiral out of control down a slippery slope to anarchy and poverty.

Given the nature of Sub-Saharan Africa’s colonial experience, the rich pre-colonial history of well-ordered societies and complex inter-communal relations, it seems peculiar that at the time of independence, African nationalists would espouse the European state as the most appropriate form of political community

(Davidson, 1978; 1992; 1994 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). Dixon (2002 *In: Zack-Williams, et al., 2002*) argues that the educative function of civil society ensures the hegemony (domination) by the elite and the legitimacy and stability of the status quo by persuading the masses to accept the political values and discourses of elite groups. A small number of urban and tribal elites received a European education both within the colony and in the colonial metropole, producing a stratum of African society conversant in the language and political discourse of the colonial state and the Western philosophy of political community. The basis of the post colonial state in Sub-Saharan Africa was the colonial state, independence not constituting a total break with colonial political values (Dumont, 1966; Dixon, 2002 *In: Zack-Williams, et al., 2002*). African nationalists were strongly committed to maintaining the states created under colonial rule (Chazan; Mortimer; Ravenhill & Rothchild, 1988 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*).

Educational programs were begun in the 1950s to train African administrators to run the postcolonial states, while indoctrinating them into Western ideas about proper political practices, values and ideas about community. The explicit objective driving colonial education was the desire to establish hegemony of the state in African civil society (Young, 1988 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). Adjiboloso (1995 *In: Leistner, 2004*) believed that colonization was a process of socialization by European powers to make subservient and serviceable Europeans out of Africans.

British colonial policy was “nation building”, something believed beyond the capacity of Africans themselves (Davidson, 1992 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). Even prior to the development of formal imperial rule in West Africa in the 1880s, from Lagos to the Gambia, westernized Creole elite were sending their sons and daughters to school in London. As briefly discussed

in Chapter 5 of this book, this western-educated few living in urban settings are distinguished from the many living in the rural environment (Davidson, 1978 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). This western-educated few played a major role in anti-colonial nationalist movements, but had been educated and assimilated into colonial civil society (Chabal, 1992 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). The rural masses were often isolated from and segregated by this system, herded like cattle into homelands to make way for colonial settlers or were forced into “slave labor” for plantations and mines and/or to produce cash crops for the colonies. Thus, two different worlds were emerging, a dichotomy of an urban elite linked to Europe and the rest of Africa. Traditional authorities were eventually co-opted by the colonial powers and post independent elites, resulting in many traditional chiefs having a greater affiliation for the state than to their own constituencies – rural villagers.

African nationalist leaders and intellectuals, as a result of the colonization of the African political consciousness, adopted the concept of the nation-state based on the European model. No alternative could be thought of (Hobsbawm & Ranger, 1992; Anderson, 1991 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). Meanwhile, historical Sub-Saharan African political communities were dispossessed by the European colonial powers as being uncivilized, unfit and incapable of self-government; a continent, which prior to the arrival of the Europeans was without a history of state and society (Davidson, 1994 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). Thus, the development of “The White Man’s Burden”, equipping arbitrarily constructed societies with European-style, political, social and national institutions (Hobsbawm & Ranger, 1992; Anderson, 1992 both *In: Dixon, 2002 In: Zack-Williams, et al., 2002*).

Take up the White Man's burden –
 Send forth the best ye breed-
 Go bind your sons to exile
 To serve your captives' need;
 To wait in heavy harness
 On fluttered folk and wild –
 Your new-caught, sullen peoples,
 Half devil and half child...
 (Kipling, 1899 *In: Rosenblum & Williamson, 1987*).

In fact, Mamdani (1994 *In: Leistner, 2004*) and Dixon (2002) argue that anti-colonial movements and African intellectuals can be considered the means by which European political-cultural hegemony was maintained long after decolonization due to alienation by these intellectuals of Africa's own rich history of pre-colonial political culture. The 50 or so states of the colonial partition were governed as though their people possessed no history of their own and became nation-states formed and governed by a political elite on the European model mainly of Britain and France. Liberation produced its own denial and led to alienation of the masses (Davidson, 1992 *In: Dixon, 2002 In: Zack-Williams, et al., 2002*). This is reflected today in conservation policies, which continue to separate the masses in rural Sub-Saharan Africa from their natural resources and associated wealth based on a Western exclusionary model, the only difference being that the state has replaced the colonial power.

Some visionaries have attempted to combine the idea of nation state with more traditional systems and decentralization of power, decision-making and economic development such as the House of Chiefs in Botswana, Moise Tshombe's attempt at federalism (see Section 11.6.6.1, The Katanga story, an “African Solution” to democracy thwarted by the “Cold War” and beginning of French/American struggle over a quest for Africa's riches), Yoweri Museveni's bottom-up no party democracy government (see Section 11.6.6.2 Uganda, democracy, civil war and

attempts to find an African solution) and South Africa's attempt at federalism (see Section, 11.6.6.3, South Africa's democracy, a possible decentralized model adapted to Africa). As described in Chapter 9, conservation movements in Africa attempting to empower communities (e.g., CAMPFIRE, ADMADE, Botswana Community Trust Program, WMAs in Tanzania and *Gestion des Terroirs* in Burkina Faso) are attempts to address this issue. Their long-term success will be dependent on the willingness of the state to divest itself from direct domination over associated natural resources, and the accrued benefits from sustainable harvesting of these resources.

Many citizens of these unrepresentative Sub-Saharan African states have disengaged themselves from the state, seeking to avoid the unacceptable decisions over which they have no control, evading taxes and duties, ignoring its regulations of employment, disregarding its edicts outlawing traditional practices (e.g., traditional hunting, grazing cattle inside national parks – many being former traditional dry season grazing areas for pastoralist communities, etc.), and deriding governments that imagine they can decree what they should grow, where they should live, how they should treat their women and what they should believe. Unaccountability of the state to its citizens has become institutionalized in Sub-Saharan Africa (Baker, 2002 *In: Zack-Williams, et al.*, 2002), while the masses are asked to be accountable to the state.

11.4 ECONOMIC DEVELOPMENT AT INDEPENDENCE

“Colonizers had pushed aside civilizations that were functioning in Africa when French kings ate with their fingers. They ruled African possessions with an authoritarian hand. On departure, they expected fledgling states to adhere to institutions that Europe had not perfected in a thousand years. The result was hardly a surprise. Small elites seized power and kept it. Tribes squared off and winners took all. Western and Eastern blocs lined up friends by bankrolling the ruling elites”, (Rosenblum & William, 1990).

The durable imprint of authoritarian regimes was left behind at independence in which governors and other officials wielded tremendous power (Meredith, 2004).

Instead of being characterized by self-sustained development, the first three decades of independence on the subcontinent were marked by the steady exacerbation of under-development, poverty and inequality. By 1990, the continent's total debt burden stood at US\$ 272 billion, two and a half times what it had been ten years before, an equivalent to 90% of Africa's Gross Domestic Product (GDP).³⁴⁵ Sub-Saharan Africa's

"total income is not much more than Belgium's, and is divided among 48 countries with median GDPs of just over \$US 2 billion—about the output of a town of 60,000 in a rich country" (World Bank, 2000).

Between 1985 and 1990, Sub-Saharan Africa paid out more in interest and debt repayment to the IMF and World Bank combined than it received from them in the form of loans and grants (Martin & O'Meara, 1995). Africa's per capita GDP fell from US\$ 671 in 1975 to US\$ 245 by 1997, most Africans being worse off than 25 years earlier. Sub-Saharan Africa's share of world trade slumped from 3% in 1950 to 1.5% in 1999. While Africa is dependent on the global economy, it is being marginalized by the global economy (Zack-Williams, 2002 *In: Zack-Williams, et al.*, 2002). Jeffrey Sachs (2005) found a strong correlation in that the probability of a country being democratic rises significantly with increasing per capita GDP, while declines were significant predictors of state failure. Most of Sub-Saharan Africa is experiencing negative per capita GDPs (see Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA & Chapter 13, Section 13.1, CURRENT STATE OF AFRICAN ECONOMIES).

³⁴⁵ See Footnote 48, Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA.

Africa's economic policy, as we shall see, was a combination of the West's creation of dependency with sometimes politically incompetent leadership, along with non-representative governments that were or are corrupt and inefficient (Martin & O'Meara, 1995).

The development strategy of the new governing classes was "Business as Usual" with a strong dependency on imported manufactured goods, while exporting raw products (Zack-Williams, 2002 *In: Zack-Williams, et al., 2002 & Chomsky, 1999*).

For the most part, colonial laws, which disenfranchised the masses from their natural resources, were converted to state laws at independence to the benefit of the new political elite running these countries, which many Westerners mistakenly believe have the interest of their people at heart. With few exceptions, the only real difference between colonialism and independence was that the skin color of the "master" changed from white to black. Uneducated, the majority of Sub-Saharan Africa's citizens have insufficient knowledge to hold their leaders accountable. The leaders had often been puppets of Western Governments during the Cold War and are still possibly today of multi-nationals, allied to Western Governments, plundering the continent's resources at the expense of the people. The controversial MIT, Professor Noam Chomsky³⁴⁶ (1996), expresses this relationship,

"Little will change from the occupation period", he predicts, "except that...control will become less direct: instead of running affairs up front,...'liaison officers' will run them via the clerks of the...Authority. Like Britain during its day in the sun...will continue to rule behind 'constitutional fictions.' No innovation of course; that is the traditional pattern of the European conquest of most of the world".

³⁴⁶ Author, Professor of Linguistics, Massachusetts Institute of Technology (MIT), Linguistic and Philosophy, 77 Massachusetts Avenue Bldg, 32-D808, Cambridge, MA, 02139, USA, Tel: 1-617-253-7819, chomsky@mit.edu.

Sankore (2005) states that the net result of Western intervention has been

“the shaping and entrenchment of economic development frameworks designed to benefit multinational exploitation of resources, and imposition of government bureaucracies to perpetuate such frameworks”.

Countries like Malawi and Mozambique retained quasi-colonial status as economies of reserve labor for mines in South Africa. West Africa, which had exported some 20 million of its people in the previous four centuries as slaves, continued the process of deskilling by exporting hundreds of its most skilled personnel each year to Europe and North America (Zack-Williams, 2002 *In: Zack-Williams, et al.*, 2002). During his tenure as regional environmental advisor to USAID in the Caribbean, a high level U.S. State Department employee in British Guyana explained that the unofficial policy of the U.S., in order to maintain its global competitive edge, was to seek out the “best and the brightest” from the rest of the World, provide them with scholarships and hope that many would never return to their country of birth, helping to fuel America’s global technological advantage (see Section 11.13.1.2, What kind of education). This is becoming more and more of a reality as American scores in math and science plummet and the country becomes more and more reliant on foreign students to fill the universities in engineering and the sciences. Meanwhile, the European Union, with an aging population that cannot fill its professional and skilled-labor demand, is issuing a “blue card”, virtually planning to steal the best and brightest from the developing world. Why would many want to return to the developing world, where salaries and standards of living are lower and opportunities restrictive – in many cases non-existent?

New nations were artificial creations bearing little relation to traditional political entities, the idea of a nation state being a foreign concept to Sub-Saharan Africa,

an unnatural union (Oyowe, 1991 *In:* Leistner, 2004). At independence, the new states were not nations - possessing no ethnic, class or ideological cement, nor strong historical and social identities on which to build and to hold them together. Pre-colonial Sub-Saharan Africa had been a mosaic of lineage groups, clans, villages, chiefdoms and empires, often with shifting and indeterminate frontiers, loose allegiances with languages and identities shaded into one another. Colonialism helped define tribe and ethnicity, creating clear frontiers often artificially divided along geographical boundaries (e.g., rivers, mountain ranges) with recognizable tribal units that could be governed. Tribal labels were often imposed on undifferentiated groups and chiefs appointed by colonial administrators as their agents and symbols of ethnicity. Sub-Saharan Africa inherited these states based on extremely fragile links, which due to colonialism enhanced ethnic consciousness – the tribal factor becoming more potent than it had ever been (Meredith, 2004).

Ethnic groups, often traditional enemies, were suddenly expected to feel and behave as a nation. The new states suffered a serious defect, lacking loyalty of a unified people. Loyalty abided with the ethnic group (Leistner, 2004). It would be analogous, 50 years ago, to expect unification of the French and Germans into one country.

National consciousness was replaced by ethnic bigotry, clientelism and institutional corruption. The democratic structures inherited from the departing imperial power were soon destroyed in favor of one-party states, controlled by what some call *petite bourgeoisie* or the elite.

African nationalism had a liberating façade, but ended up in alienation, as political freedom failed to restore Sub-Saharan Africa's own history, unlike Japan, which was able to take the good from the West without jeopardizing its

cultural integrity. Sub-Saharan Africa's modernization has so far alienated Africa from itself in implementing the "imperial model" or "foreign model" which asserts that nothing in Sub-Saharan Africa's (past) experience is valid for the future. Statism became central to the new model of collective identify and the so-called "Chiefs", who in the past were the guardians of the people, their self-respect and traditions (Zack-Williams, 2002 *In: Zack-Williams, et al.*, 2002), have become the "Big Men" the "President's for Life" who exploit their people. Instability became the status quo, as those aspiring to become "Big Men" and their constituents vied to control each nation's wealth of natural resources. From the early 1960s to the late 1980s, the continent had more than 70 coups *d'etat* and 13 presidential assassinations (Shiner, 2004) (see Section 11.6.3, Neo-Patrimonial Clientelism, the Big Man and "Cosmetic Democracy").

By the end of the Cold War (1989), there was a reassessment of foreign policy towards the south, with a shift away from supporting authoritarian regimes to stressing the role of civil society. In 1990, there were only four African countries where multi-partyism was allowed. There was Senegal, the Gambia³⁴⁷, Botswana and Mauritius (Shiner, 2004). The role of civil society in reforming African states and non-governmental organizations (NGOs) became the way forward for the donors in an attempt to rebuild failing African states from the bottom-up (see Section 11.9, THE NEW SAVIORS OF SUB-SAHARAN AFRICA; NGOs). Western intervention was considered legitimate (Hearn, 2002 *In: Zack-Williams, et al.*, 2002). Hearn (2002 *In: Zack-Williams, et al.*, 2002) also believes the definition of civil society and its role in minimizing state intrusion into private life or abuse of power is too simplistic. In many cases, it implies the growth of NGOs to meet social needs outside the realm of the state. Ironically, Hearn (2002 *In: Zack-Williams, et al.*, 2002) believes that it is the urbanized and educated state employees, such as teachers, doctors, lawyers, university staff, nurses and other

³⁴⁷ The Gambia has since had a *coup d'etat* by a junior military officer and current president, Yahya Jammeh.

civil servants who are the most likely sources to galvanize citizens to use the rights they have to organize and protest against bad governance.

Of course, the West did not ask itself how this “monster” of failed-nation states was created and its own culpability in the current situation facing Sub-Saharan African states. Although, one could argue “too little too late”, with the end of the Cold War and without alternative sources of support, the Western donors and International Finance Institutions (IFIs) were basing funding more and more on conditionalities such as good governance, rule of law, multi-party elections and a basic democratic process.

11.5 AFRICA UNRAVELS – STATE LED DEVELOPMENT

“Africa’s greatest problem may be the enduring myth that Africans are unable – or somehow unwilling – to improve their lot. The continent teems with economists and agronomists, entrepreneurs and investors, peasant farmers and laborers, all anxious to build prosperous states. Most are blocked from above and below, and their frustration is yet another African tragedy”, (Rosenblum & Williamson, 1990).

“The African crisis is not the failure of the people nor the failure of Americans to feed a starving continent. It is basically the failure of state-oriented enterprises” (Burkinabé Pierre-Claver Damiba, former African Director for UNDP *In: Rosenblum & Williamson, 1990*).

In the case of conservation and wildlife, Majamba (2001) concludes that at independence African governments retained most colonial wildlife laws and institutional set-ups. This ensured the continued exploitation of the hunting industry for the benefit and interests of the international trophy market, with the government being the conduit pipe. Inheriting the colonial laws and policies meant the inheritance of hostility between the government and local community members. Rural communities continued to be denied access to resources in

colonially created national parks and game reserves from which they had been forced to re-locate, sometimes by compulsion, leaving their ancestral lands and abandoning their age-old hunting practices. In adopting the colonial hunting laws and policies, newly independent governments retained policies based on alienating and marginalizing local community members from the hunting industry. Communities living in the vicinity of safari hunting areas continued to resent efforts to develop the hunting industry. After independence, most local people's interests were still not considered paramount by Sub-Saharan African game and park departments. They saw no benefits from safari hunting or ecotourism as a conduit for generating revenue to improve their (local peoples') living standards (Majamba, 2001).

“African Capitalism” at independence attempted to use “neo-colonialism” as a development strategy, relying heavily on Western foreign aid and foreign investments to develop their economies to promote both industrialization and large-scale agriculture. Afro-Marxist regimes such as Tanzania and Guinea-Conakry tended to align themselves with the Soviet Union and Eastern Bloc.

In 1960, following independence, ambitious leaders promising prosperity invested in public controlled industries - Import Substitution Policy, absorbing large amounts of government revenue. These were often promoted and supported by donors and International Finance Institutions (IFIs) (Martin & O’Meara, 1995). Initially many donors supported a development model in the Third World that backed autocratic regimes and the finance of state apparatuses (e.g., inefficient and corrupt state parastatals that took the place of the private sector) in an effort to overcome what had been perceived as internal blockages (e.g., lack of a local entrepreneurial business class) (Hoogvelt, 2002 *In: Zack-Williams, et al.*, 2002). Senegal had 100 parastatals employing four times the manpower needed. Many parastatals became part of the patronage systems that developed, providing

political favors or jobs for the extended family. By the 1980s, Sub-Saharan Africa was de-industrializing as foreign investors looked to more promising markets in Asia and Latin America (Meredith, 2004).

Leistner (2004) argues that the political elite, in order to maintain their lifestyles after independence, continued to serve the interests of the overseas powers (e.g., raw products for the Mother country). They thus used the state to control the means of production without ownership, allowing them to exploit others without appearing to be capitalists. Reno (1995 *In:* Hoogvelt, 2002 *In:* Zack-Williams, *et al.*, 2002) describes the development of the “Shadow State” of unofficial and illicit ties that bind the interests of state officials, rulers and rival strong men with foreign commerce and investors. Babu (1985 *In:* Leistner, 2004) calls these elite, “economic hijackers”, delivering their countries into a new form of colonial bondage where the mass of people live in poverty, while the elite live apart in a world of conspicuous consumption and materialism. As Leistner (2004) puts it,

“Whereas the poor showing of African leadership is generally known, it is less generally appreciated to what extent the rest of the world, and more particularly the West has contributed to that state of affairs”.

This resulted in economic stagnation or backsliding, with no incentive to see economic progress, education of the masses or the creation of a majority middleclass that would increasingly demand a share in the wealth generated from these resources. This concept will come out very strongly in Chapter 13 on the international private sector in Africa.

Thus, it has never been in the interest of Sub-Saharan Africa’s political elite to institutionalize the state in a Western sense. It also becomes imperative to exploit government resources for patrimonial purposes, as opposed to the Western model of state in which office holders lose all right of ownership to public goods. The

elite was or is not interested in promoting development because, through the state, political power gives access to all the wealth they need (Leistner, 2004).

Development would mean an educated majority middleclass that would no longer accept the squandering of a nation's wealth on a few. Many Sub-Saharan African leaders feared the development of capitalism, as the emergence of a strong class of private businessmen could threaten the position of the elite, and an economic power, tends to be a pathway for political power. Therefore, capitalism was deliberately confined to small-scale operations (Leistner, 2004) such as the market economies one sees throughout the subcontinent. Examples of leaders who put the breaks on the emergence of a powerful private sector include Nkrumah of Ghana, Joseph Désiré Mobutu Sese Seko of Zaire, Houphouët-Boigny of Côte d'Ivoire (the Ivory Coast) and Senghor of Senegal (Boone, 1998 *In:* Lewis, 1998 *In:* Leistner, 2004).

Ayittey (1998 *In:* Dixon, 2002 *In:* Zack-Williams, *et al.*, 2002) argues that: 1) Predatory elite rule, and 2) Statism lie at the heart of Africa's ongoing crisis. Guest (2004) argues predatory, incompetent governments impoverish Africans through corruption, bad economic policies and intimidation or terror tactics, especially to any opposition that scare off potential investors. The state as the only resolution of community remains central to African political thought, effectively de-legitimizing the non-state versions of community, thus trapping Sub-Saharan Africa in the political culture of the empire (Dixon, 2002 *In:* Zack-Williams, *et al.*, 2002). Davidson (1992, *In:* Guest 2004) believes that the state failed to obtain legitimacy in the eyes of the majority of Africans, benefiting only a small elite. To defend themselves against the illegitimate state, they turned towards tribalism, which in a political setting of Western imposed nation states turned into clientelism, a system of patronage linked to personal, family and similar networks. He believes that the problem in modern Africa lies not in

tribalism, but in its politicization, dating back to its manipulation by colonial authorities (see Section 11.6 AFRICAN DEMOCRACY IN THE 20 AND 21ST CENTURIES).

These elite, in cahoots with Western government and multi-nationals, extract the wealth of rural communities (e.g., wildlife both consumptive and non-consumptive, minerals and timber). With little or none of the wealth circulating in rural areas, there is no buying power, little money exchanging hands and therefore no knock-on effect of wealth demanding the production of various products that could lead to industrialization. Most wealth either stays in Sub-Saharan African capitals with the elites or flees overseas resulting in stagnant or declining economies in Sub-Saharan Africa on the richest continent in the world. There is little investment in providing basic services such as infrastructure, health care or universal education (see Section 11.6.3, Neo-Patrimonial Clientelism, the Big Man and “Cosmetic Democracy”).

Soon pre-colonial trade routes were being reopened by the impoverished peasant populations seeking to minimize exploitation by smuggling cash crops (e.g., cocoa in Ghana in the 1960s and 70s, coffee, ginger and cocoa in Sierra Leone and coffee in Uganda) and even livestock across national boundaries. Corrupt marketing boards under-paid peasants for their cash crops while maximizing their profits on the world market (Zack-Williams, 2002 *In: Zack-Williams, et al.*, 2002). In the 1980s, the principal author recalls in the Fouta Djallon of Guinea-Conakry, seeing livestock being temporarily moved across borders in order to avoid paying government head taxes.

A fine example of state led development is Senegal’s SAED, a government parastatal that has unsuccessfully been behind large-scale irrigation schemes linked to dams on the Senegal River and the loss of traditional production

systems, impoverishing the masses (see Chapter 7, Section 7.10.5.1, Senegal River and Chapter 12, Section 12.4.4.1, Impacts of structural adjustment (SAP) on peasant farmers along the Senegal River). Little and Watts (1994 *In: Berry, 1995 In: Martin & O'Meara, 1995*) and Ayako and Glover (1989 *In: Berry, 1995 In: Martin & O'Meara, 1995*) made similar observations.

State led development spawned a series of interventions including:

- Erection of Tariffs and other Import Controls;
- Domestic Subsidies on Food Staples and Fuel; and
- Provision of Social Welfare Services such as health and education.

The latter two were often undertaken in excess of the financial capacity of the state. State led development also buttressed a growing, poorly paid bureaucracy (the main source of employment into the 1970/80s for most educated people, as the formal private sector, was significantly absent), fed a kleptocratic elite and made corruption at all levels an endemic feature (Hoogvelt, 2002 *In: Zack-Williams, et al., 2002*) (see Section 11.7.6, Foreign Assistance and African Governments, the Major Employers in Post-colonial Africa). The negative side of state led development was condoned by the Western donors because of the Cold War (strategic), everything else being ignored as long as these failing states sided with the West.

State parastatals were mismanaged, requiring more borrowing and increasing debt (see Chapter 12, Section 12.3.4.2, Structural adjustment and privatization of parastatals), while rural-urban migration increased as human (see Chapter 5, Table 5.12: Existing and projected populations in Africa and Sub-Saharan Africa) and livestock (see Chapter 6, Table 6.2: Livestock numbers Sub-Saharan Africa, 1961-2003) populations, with modern-day medicine and veterinary care increased

up to 6.5 times in the 20th century, outstripping the ability of many of Africa's fragile ecological systems to support them (see Chapter 5, AGRICULTURE IN SUB-SAHARAN AFRICA (SSA) SINCE COLONIALIZATION). A review of 30 years of agricultural spending, beginning in the mid-1970s, indicates that this had a largely negative effect, resulting in a decline in efficiency and honesty of the parastatal agencies. Much of this attributed to large and poorly-controlled aid inflows during the period (Friis-Hansen, 2000 *In:* Sogge, 2002a).

As today, the urban centers had neither the infrastructure nor the jobs to support the large urban influx of poor uneducated peasants escaping increasingly degraded rural areas incapable of sustainably supporting the exploding rural populations. This turned many of Sub-Saharan Africa's urban centers into some of the worst slums in the world without adequate infrastructure (sewage, clean water, schools, clinics and roads) or jobs to provide an improved quality of life. The real jungles of Sub-Saharan Africa, where two-legged predators roam freely, are its urban centers where societal norms of the rural areas have broken down and crime has become a way of life (Kaplan, 1994). Kaplan argues that Sub-Saharan Africa lies at a historical bend in the river in that it could become the symbol of worldwide demographic, environmental and societal stress in which criminal anarchy emerges as the real strategic danger (Kaplan, 1994 *In:* Martin & O'Meara, 1995). This will only worsen as urban populations begin surpassing rural populations by 2020 (see Chapter 5, Section 5.7.5, Food Security and Urbanization in Sub-Saharan Africa) because

“the rate of urbanization is twice as fast as in Asia or Latin America, with only a moderate expansion in the productive economic base to support it...’premature urbanization’...Too often the result is life in slums, which in turn draws many – especially young people disaffected by exclusion from labor markets and other opportunities – into a slide of anti-social behavior and crime” (Commission for Africa, 2005).

In the face of a global recession and increase in political instability in Sub-Saharan Africa by 1980, foreign investment sharply declined in the subcontinent. By the mid-1980s, most Sub-Saharan African economies were caught in a double bind of falling per capita incomes, and spiraling foreign debts. In fact, Sub-Saharan Africa saw no increase in its per capita incomes between 1965 and 1999 (House of Commons, 2002). By the mid-1980s, 60% of Africa's countries were under military rule. Where democracy existed, it was an illusion. Human rights violations, official corruption and lack of government accountability were commonplace. By 1986, Africa was a continent in "economic free fall", with rampant poverty under-development, economic dependence, ethnic and class conflicts, absence of democratic practices and authoritarian regimes (Martin & O'Meara, 1995). Centrally controlled economies, inefficient government parastatals masking as the private sector and protected markets were failing and Sub-Saharan Africa was becoming "Donor Dependent", losing what little pride and dignity it might have had at independence. The

"donor dependency syndrome is seen as a major obstacle to development...has resulted in an erosion of initiative and lack of ownership of the development agenda...which has led...into unprecedented apathy" (United Republic of Tanzania, 1998 *In: Junge, 2004*).

Where Western investment took place, it was often based on unskilled poorly paid "slave labor", no environmental controls and often negotiated deals such as under-costed hydro-power, as described in Chapter seven on dams, or "sweet deals" cut with multi-nationals where a few elites were provided with Swiss bank accounts with regard to mineral and timber resources, maximizing the profits of the multi-nationals, with little or no concern for sustainability, or if any of this generated wealth was reinvested back into the country's people or infrastructure (see Chapter 13, THE CURRENT AND FUTURE ROLE OF THE PRIVATE SECTOR IN SUB-SAHARAN AFRICA, RESOURCES WARS OR NEPAD?).

While the world was at the peak of the Cold War, the East and the West were vying for control of Africa's rich resources. During the Cold War, the U.S. provided more than \$1.5 billion worth of arms to African countries that were considered geo-strategic allies. The U.S. also bankrolled dictators in African states, such as Mobutu Sese Seko in the former Zaire and Siad Barre in Somalia. It is many of these Sub-Saharan African countries that had "special" Cold War relationships with the U.S. that fell into political turmoil and violence in the 1990s and are often referred to as "failed states" (e.g., Liberia and Somalia) (Africa Action, 2003) and the DRC (former Zaire/Congo Belge).

The era of "political conditionalities" had begun, in which Western donors and International Finance Institutions (IFIs) began dictating economic and political policies to countries in return for grants and loans (Hoogvelt, 2002 *In: Zack-Williams, et al.*, 2002) (see Chapter 12 for details). This may be considered a legitimate form of interference in the internal affairs of sovereign states (Sogge, 2002b). African leaders and bureaucrats became masters at playing one donor off on the other and in signing "condition precedents" outlining various steps to be taken by a government or organization in order to obtain the loan or grant, or to write-off bad debts and then doing everything, but what was agreed on. Debt relief being talked about in 2005 is not new, but incestuous in Sub-Saharan Africa. Western donors and IFIs turned their heads, even to corruption, as long as the country stayed in line with their politics of the Cold War (see Chapter 11, Sections 12.5.2, 2005 Debt Cancellation and 12.5.3.1, Debt relief creates more debt).

11.6 AFRICAN DEMOCRACY IN THE 20 AND 21ST CENTURIES

“As my understanding of territory grew, I came to recognize the (Sub-Saharan African) independence movement included two serious flaws: First, the black nations accepting those arbitrary borders which had been drawn by the colonial powers in their splitting up of the world’s spoils. In the Congo, for example, a major tribe like the Bakongo was divided among European-derived entities known as Angola, the Belgian Congo and the French Congo; whereas, on the other hand, Katanga, a separate entity ethnologically, traditionally and geographically, had for conveniences of Belgian administration been placed within an area which all but the Congolese regarded as the Congo. And the second flaw, of course was that none of the new states resembled biological nations. Allegiances were tribal and local” (Ardry, 1966).

Even in the 21st century, it can be argued that in many countries, African governments still represent the interests of the political elite to the detriment of the masses. It can even be argued that under the guise of democracy, a politburo-like government elite live off the natural resources of the continent, while the true owners (small-scale rural societies) are disenfranchised and forced to live in poverty. Democracy becomes a façade for communist-like systems that are doomed to the ruination of the subcontinent. Thus, until resource/land tenure systems change and thus wealth distribution, can any form of governance be considered democratic in nature other than through superficial voting processes that have yet to change reality for most people on the ground?

An estimate of the democratic status of Sub-Saharan African countries at the close of 1999 is contained in Table 11.1, though based upon the above, one must be wary of the word “democracy” and what it really means – often a veneer of superficial elections, while a predatory elite, through the state continue to claim ownership over all natural resources and the sole right to economically benefit.

Source: Freedom House (1999) with permission, Freedom House.							

The New York based policy institute, Freedom House, estimates that 18 (21 in Table 11.1) Sub-Saharan African countries can be considered genuine electoral

democracies. A dozen Sub-Saharan African nations have undergone peaceful transfers of power from one political party to another since 1990 (Shiner, 2004). As will be discussed below, multi-partyism, especially when there is one dominant party or an uneducated and often terrorized electorate, does not necessarily mean democracy or representative governance. Senegal and Kenya appear to be moving towards what one might call a democracy – though the disputed 2008 Kenya elections call this into question (See Chapter 5, Section 5.7.1.3, Improperly planned land tenure and impacts on wildlife and conflicts between pastoralists and small-scale farmers, Amboseli and Maasai Mara, Kenya), while other so-called democracies such as the Central African Republic and Sierra Leone have experienced respectively a coup *d'etat* and a civil war. Many so-called democracies are still more procedural than actual, with the voice of the people far from being heard by so called democratically elected governments. Press freedom is certainly a long way from being the norm in much of Sub-Saharan Africa (Reporters without Borders, 2004). In simple terms, democracy in Sub-Saharan Africa is still very fragile and far from being institutionalized, even in those countries listed as democratic.

Today, Zimbabwe would be considered having regressed to an authoritative regime (AR).

11.6.1 Pre-Colonial Rule in Sub-Saharan Africa

Briefly, Leistner (2004) argues that traditional African society was highly democratic. Very often chiefs would be deposed or killed if too autocratic or if they failed to meet the expectations of their people. Zulu kings could not make laws without the consent of their councilors (*indunas*). Similarly, in many Bantu cultures, the local chief could not make key decisions without agreement by elders/headmen. Western style winner-take all voting, in which the majority can impose itself on a minority, is foreign to Sub-Saharan Africa. Kofi Annan,

Secretary General of the United Nations at a 2002 conference in Durban, stated (Gilliomee, 2003 *In: Leistner, 2004*):

“In Africa rulers listened to the ruled and the majority to the minority. Our traditions teach us to respect each other, to share power, to give every man his say and every woman hers. Consent and consensus, achieved through long and patient discussions, are at the heart of these traditions”.

“Authoritarianism and despotism cannot be justified on the basis of African tradition”, Dr. Busia former Ghanaian President (Ayittey, 1989 *In: Leistner, 2004*).

Unfortunately, many of the elites emerging out of colonialism did not emanate from the traditional ruling class, lacking a sense of responsibility that had been the hallmark of traditional rulers (see Chapter 3, Section 3.1, COLONIAL STATE IN AFRICA and Chapter 11, Section 11.4, ECONOMIC DEVELOPMENT AT INDEPENDENCE).

11.6.2 One Man, One Vote Multi-Party Elections, the Cure-All – Transition from Colonialism to Independence

One thing underlying all the difficulties caused by the interactions of Sub-Saharan Africa’s history over the past 40 years is weakness of governance and the absence of an effective state.

“By governance we mean the inability of government and the public services to create the right economic, social and legal framework which will encourage economic growth³⁴⁸ and allow poor people to participate in it” (Commission for Africa, 2005).

Independent Sub-Saharan Africa inherited autocratic rule and structures from colonial administrations, assuming power in the absence of firmly rooted

³⁴⁸ Economic growth is the annual percentage rate change (from year to year) in a nation's “real” (adjusted to remove the effects of inflation) gross domestic product (real GDP)

democratic institutions and processes (Martin & O'Meara, 1995; Leistner, 2004). Multi-party one man, one vote elections tended towards one-party systems preferred by the ruling elite. One-party systems were closer to African tradition and brought more stability than multi-parties that resulted in ethnic divisions. Autocratic rule by one man or a small clique was a travesty of traditional African political decision-making, but was erroneously accepted by the West as being part of Sub-Saharan African tradition. Leaders such as Julius Nyerere (Tanzania) and Kaunda (Zambia) deluded themselves that their one-party states were democratic as they slowly returned to the autocratic legacy of colonialism. Instead of relying on the metropole for support, they turned to their ethnic group (Ayittey, 1989 *In:* Leistner, 2004). Musah (2000 *In:* Musah & Fayemi, 2000) argues that

“the one-party system actually midwifed the present confrontations, firstly denying space for healthy competition between ideas and among personalities and secondly, by destroying the nascent structures of checks and balances within the body politic”.

Often, to maintain their power base, they co-opted the armed forces into the elite (Leistner, 2004). Thus, the beginning of patronage politics, discussed in Section 11.6.3, Neo-Patrimonial Clientelism, The Big Man and “Cosmetic Democracy”.

In most cases the West has tended to take a cookie cutter approach to democracy in Africa; “one man one vote multi-party elections”. Parties have tended to become tribally and/or religiously divided as opposed to ideological, and democracy has tended to be “one man one vote one time”, the leader or “Big Man” either being run out by a coup *d'etat* or dragged out with his heels in the air. Low economic development and little experience with Western-style governance resulted in the collapse of artificially installed democratic models, almost everywhere in the first decade of independence, by military coups and/or incumbents establishing one-party or one-man rule. In the worst case, as in

Rwanda/Burundi, “one man one vote multi-party elections” can result in mass genocide that pits one patrimonial group against another (see Chapter 13, Section 13.8.6, Former Cold War allies vying for power in the Great Lakes Region).

Out of a list of 50 African countries in 1989, almost all were one-party states or military dictatorships (Meredith, 2004). By the 1990s, heads of state in Africa had a 60% chance of losing power through assassination, exile or imprisonment (Reno, 2001 *In:* Friedl, 2001 *In:* Leistner, 2004). By the early 1990s, more than half the African states underwent transitions from military or one-party regimes to civilian rule. Much of this was a formality that allowed political parties with little change under the surface. By the mid-1990s, military coups in Burundi, Sierra Leone, Niger, Congo Brazzaville, Gambia (Cliffe, 2002 *In:* Zack-Williams, *et al.*, 2002) and more recently the Democratic Republic of Congo, reversed these trends. By 2000, military leaders had replaced civilian governments in more than half the African states (Reno, 2001 *In:* Friedl, 2001 *In:* Leistner, 2004), often under the guise of democracy.

Where multi-partyism exists, there tends to be a dominant party and thus little balance of power or accountability. Thus, existing elites continue (Cliffe, 2002 *In:* Zack-Williams, *et al.*, 2002), often in tandem with Western Governments and multi-nationals, to implement policies that benefit a minority of the population. Sub-Saharan African leaders have become adept at accommodating the international norm for competitive elections, while at the same time learning to manipulate them to their own ends (Bratton, 1999 *In:* Cliffe, 2002 *In:* Zack-Williams, *et al.*, 2002), with the Zimbabwe parliamentary election of 2000 and presidential election of 2002 being good examples. Rural peasants are incorporated into mainstream politics to a very limited extent and are often excluded from the definition of “civil society” (Cliffe, 2002 *In:* Zack-Williams, *et al.*, 2002). By 2004, every Sub-Saharan African nation had held elections, except

for the Democratic Republic of Congo (DRC/former Zaire), though the degree of fairness of polls across the continent has varied widely (Shiner, 2004).

In many cases “democracy in Africa” has been a façade for the establishment of Western controlled puppet governments, as former allies of the Cold War, especially France and the United States, battle each other for control of the continent’s vast natural resources (see Chapter 13, Section 13.8.2, American Imperialism in Sub-Saharan Africa, a Struggle for Control of Francophone Africa). “Democracy” has become a buzz word, the flavor of the moment, with little or no substance. Foreign aid enriches an elite who go through the motions of the “democratic process”, using this very process to enrich themselves and their Western allies (see Chapter 13), while the majority continue to live in misery and poverty which is worsening under one of the fastest growing populations in the world (see Chapter 5, Table 5.12: Existing and projected populations in Africa and Sub-Saharan Africa). The wrong sort of aid helps leaders hold out, sanctioning some of the worst gangsters of the century, one-man kleptocracies and military dictatorships (Rosenblum & Williamson, 1987).

A classical example of patrimonial politics was Mobutu Sese Seko (born Joseph-Désiré Mobutu) of Zaire (today’s DRC). He first seized power in June 1960 from Congolese President Joseph Kasavubu and Prime Minister Patrice Lumumba, and stepped down in February 1961, only to seize power for the next 32 years in November 1965. He was supported by the United Nations, who themselves hired mercenaries, British trained Nepalese Gurkha soldiers to fight the Katanga mercenary forces helping the province secede. He would later be supported by French, Belgian and the U.S. military while it served their purposes to use Zaire for a Cold War staging grounds into Angola. He established a one-party state in 1966. His “Zaireanization” policy was less about Africanization than patrimonial rule, giving him and his ethnic group control over the means of accumulation that

should have gone to the state and its people. He had a patronage system of strongmen, many from his Ngbandi clan, and clients who personally controlled Zaire's multiple centers of accumulation (e.g., mining centers for diamonds, copper, cobalt, COLTAN (columbite-tantalite), gold, etc., as well as coffee, timber and oil) (Pech, 2000 *In: Musah & Fayemi, 2000*) (see Section 11.6.6.1, The Katanga story, an "African Solution" to democracy thwarted by the "Cold War" and beginning of French/American struggle over a quest for Africa's riches).

Shiner (2004) explains that "in a number of countries, whether it's Zimbabwe or Gabon or Cameroon or Togo or Guinea-Conakry, you have leaders who have been in power for well over 20 years who have outlived their usefulness but continue to cling to power and have become part of the problem rather than the solution to democratic governance" – the "one man one vote one time syndrome" as discussed above.

Americans are evangelical in the promotion of their system of governance on Sub-Saharan Africa and the rest of the world, including multi-party elections, a three-part governmental structure (legislature, executive and judiciary), active private media and lobbying non-governmental organizations (NGOs) as watchdogs. These superficial processes may or may not be compatible with Sub-Saharan African cultures and societies, but as importantly, they stay clear of the real issues such as social justice and economic dignity for all citizens. Thus, the pre-packaged U.S. model of governance being exported around the world takes on an artificial technical quality often resembling the theatre of the absurd (Sogge, 2002a).

Democratic process requires:

- Accountability.
- Human Rights Protection.
- Popular Control.
- Political Control.
- A Free Press

which provide power for scrutinizing executive conduct, legislation and public expenditure (Zack-Williams, 2002 *In: Zack-Williams, et al., 2002*). “Governments need to include civil society in ways that surmount the problems associated with Africa’s highly multi-ethnic states. Instruments of accountability need to be institutionalized” (World Bank, 2000).

“Aid-speak” is full of many plastic words such as good governance, human rights, anti-poverty, deregulation, de-bureaucratization, decentralization, multi-party democracy, civil society and anti-corruption (Sogge, 2002a). In many cases, these processes are absent and democracy becomes a façade. It is pure arrogance to think that America or Europe can take their system of governance and create the same system in other cultures. Real democracy comes out of “many subtle individual human battles” fought over decades and centuries that result in building traditions – the defense of democracy being the traditions of democracy.

“At present we are obliged to travel willy-nilly into the vain land of corporate hegemony with its self-serving notion that democracy is a nutrient to be injected into any country anywhere, a totally oppressive misconception of the delicate promise of democracy, which relies on the organic need to grow out of itself and learn from its own human errors” (Mailer, 2003).

From Sub-Saharan Africa's perspective, "The very idea that people can be forced to be democratic and/or free is quite startling. Freedom and liberation from autocratic rule, as well as democracy and accountability cannot be decreed. They must have a social basis in which they arise, are nurtured and sustained" (Barya, 1993 *In:* Sogge, 2002a). Democracy must fit within the socio-cultural framework of a given country and its history, not America's or Europe's. Unfortunately, in today's Africa, in many cases "Central Government" controls "Local Government" (e.g., Kenya) or at worst, as in Sierra Leone, Siaka Stevens abolished local government in 1972 (Zack-Williams, 2002 *In:* Zack-Williams, *et al.*, 2002).

Kofi Annan, a Ghanaian and Secretary General of the United Nations, in a speech given on March 25, 2004 to the UN Security Council, scolded West African leaders by pointing to the root causes of the regional instability as being linked to questions of governance, human rights and transparency. "Until they are addressed with real resolve, until there is a fundamental break with authoritarianism and the culture of violence, exclusion and impunity, I fear that whatever inroads we manage to make in handling cross-border problems will remain just that - temporary inroads, and fragile at best" (Heinlein, 2004). As will be seen throughout the next three chapters, African leaders are to blame for much of the problems on the continent, while their actions are often in complicity with Western governments and their multi-nationals.

"Recent analysis of the determinants of civil wars in Africa and other regions points to deep political and economic development failures as the root causes. In diverse societies where inter-group interactions have been uncooperative, the fundamental problem has been a failure to develop political institutions able to accommodate such diversity. The highly centralized governance systems in most African countries have failed to take into account sociopolitical differences" (World Bank, 2000).

This becomes explosive when mass poverty enters the picture, igniting ethnic, religious, and cultural diversity into hatred and conflict as these groups compete for survival, while often a small elite reap the majority of the benefits at the expense of the masses. The World Bank (2000) argues that faction-ridden (ethnically diverse) societies are best administered by a consensus-based decentralized inclusive democracy. However “a government has not decentralized unless the country contains autonomous elected sub-national governments capable of taking binding decisions in at least some policy areas” (World Bank, 1999 *In: Junge, 2004*). The World Bank (2000) believes that “good governance should aim to achieve the ‘three E’s’:

- Empower citizens to hold governments accountable through participation and decentralization.
- Enable governments to respond to new demands by building capacity.
- Enforce compliance with the rule of law and greater transparency”.

Sub-Saharan Africa “must develop democratic systems that facilitate political inclusion and representative parliaments, able to respond to the needs of a citizenry that defines itself largely in terms of ethnic kinship, including” (World Bank, 2000):

- “Informal power sharing among elites.
- Proportional representation that protects minorities.
- Bicameral legislatures in which one (upper) chamber represents diverse regional or ethnic groups, giving them equal power regardless of their numerical or economic strength.
- Regional autonomy, with compensation mechanisms for less advantaged regions.
- Federalism with national-level guarantees of individual rights so that discrimination against minorities in specific states can be assuaged by higher intervention.
- Confederacy, providing constituent groups with wide powers short of national defense and foreign policy” (World Bank, 2000).

It sounds good on paper, but it is Sub-Saharan Africa and Africans who must determine how to develop such concepts that fit into their cultures and societies. Interestingly enough, an evaluation of foreign aid and development by the U.S. Congress found that democracy on its own is not a guarantee for economic development (Bhagwati, 1995 *In: CBO, 1997*):

- “Democracies with markets have had good economic performance and strong social indicators. Most Western countries are in this category.
- Democracies without markets have had poor economic performance and weak social indicators. India has been the classic example.
- Authoritarian governments without markets have failed in terms of economic growth and social indicators. The former socialist countries of the Soviet bloc are obvious illustrations.
- Authoritarian governments with markets have made rapid gains in prosperity. Examples include China, the fast-growing countries of East Asia, and Chile under General Pinochet”.

Similarly, Sachs (2005) believes that links between democracy and economic performance are weak, citing the emerging economic giant China with low freedom, and low economic growth in Switzerland and Uruguay where freedom is good. Thus, while economic growth may increase as indicated by GDP/GNP, even in countries with low levels of democracy, it is rare to find democracy in countries with declining per capita GDPs, typical of Sub-Saharan Africa (see Section 11.4, ECONOMIC DEVELOPMENT AT INDEPENDENCE and Chapter 13, Section 13.1, CURRENT STATE OF AFRICAN ECONOMIES). Other constraints to economic development, as discussed in this book, include ecology/climate, infrastructure and proximity to markets, culture, educational levels, health and fertility rates, land and resource tenure, geopolitics and trade (Sachs, 2005). Democracy, though it can facilitate growth, without markets will not be able to sustain economic growth (CBO, 1997) and in fact, could regress to

more repressive forms of government and even anarchy. On the other hand, economic development, as judged by this analysis, does not necessarily imply freedom of speech, open presses and transformation of society, which certainly occurs with greater difficulty under authoritarian governments.

11.6.3 Neo-Patrimonial Clientelism, the Big Man and “Cosmetic Democracy”

“Culture is how the past interacts with the future. Africa’s past is one in which, in pre-colonial times, people grouped themselves through clans. Their culture was strong on kinship ties and a sense that the members of the group were responsible for and to one another. Many of these features, such as the relationship between elders and non-elders, persist today. Not least here is the ‘big man’ culture which requires a successful member of the clan to offer patronage to other members – a phenomenon which is rarely taken with sufficient seriousness by development...What can appear to donors as a form of anarchy is in fact structured; it is just that these are structures which Westerners are not trained to perceive. Africans survive – and some prosper – in the face of low incomes and few jobs in the formal economy. They do so using a complex network of social relations that make decisions about who gets start-up capital for small enterprises or interest-free loans in emergencies. These networks may be informal but they reveal how African people will get involved in activities where they can see purpose and direction...such networks are seen as alternatives to the state. That is most obviously true in places like Somalia where the state has completely collapsed. But all across Africa there are ‘failed states’ in the sense that they are unable to provide the basic legal and economic frameworks, or public services like health and education, which citizens expect. There is a widespread cynicism with politicians. In the Wolof language (of West Africa, especially Senegal and Gambia) the word ‘politig’ has come to mean lying or deception. Voters have become disillusioned” (Commission for Africa, 2005).

Chabal and Daloz (1999) believe that the fundamental prerequisite for development of a modern “Western” state of institutional emancipation from

society is culturally incompatible with Africa. Chabal and Daloz (1999) argue that this is because the neo-patrimonial clientelism that exists in which wealth redistributed to the “Big Man’s” communal support base (his extended family, village, ethnic group, religious group, region, etc.) helps nourish the clientele who keep the “Big Man” in power. In ethnically diverse societies, public sectors are faced with continuous pressures to dispense patronage along ethnic lines (World Bank, 2000).

Ake (1976 *In:* Leistner, 2004) believed that while ethnic conflict always existed, this increased after independence due to growing poverty and misrule. In a stagnating or shrinking economy, the communalization of politics results in each ethnic group’s struggling, by cheating and fraud, to place its protégés in power in order to guarantee themselves a portion of the national cake (Young, 1997 *In:* Leistner, 2004). Alemayehu (2000) believes that the fall in real terms of salaries from inflation and devaluation adds to this problem, with salaries falling well below minimal financial needs. In the 1980s, when the principal author was in West Africa, the average Gambian state employee made US\$ 25 per month. Even today in 2005, the head of hunting for all of northern Tanzania, overseeing a multi-million dollar business, makes only about US\$ 75-100 per month (Mremi, *pers. comm.*). This is disgraceful and one must ask what happens to the wealth generated from wildlife. Anyone who can remain honest on such a salary should be an automatic candidate for sainthood. Under such circumstances, many leaders have also played the ethnic card as a tactic to divide and rule (Shiner, 2004).

Once patronage becomes a major instrument of politics, it permeates and subverts public life in which merit plays no role, but ethnic and clan affiliations do. Corrupt elites are easily turned into willing tools of harmful outside interests. Once the opposition is eliminated (e.g., chased out, killed or muted as under

Sekou Touré of Guinea-Conakry, Banda of Malawi, Moi of Kenya and Mugabe of Zimbabwe), human rights are abandoned, while freedom of speech and the press become controlled by the autocratic ruler (Leistner, 2004). Ake (1985 *In:* Leistner, 2004) believes that many post-independent Sub-Saharan African rulers mobilized their people with the idea of an egalitarian, if not socialist democracy, that they had to either make good on, or disenfranchise the people politically. They chose the latter, while trying to remain permanently in power through political repression – that is until another clan or ethnic group overthrew the current group in power. This helps account for the turbulence of the 1960s until today, mixed in with global politics as will be discussed in this chapter along with Chapters 12 and 13. Initially, these indigenous elites had the trust of their people until it was realized that they differed little from their foreign predecessors (Leistner, 2004).

11.6.3.1 Patronage politics, Zimbabwe's Department of National Parks and Wildlife Management (DNPWM)

The Department of National Parks and Wildlife Management (DNPWM) in colonial Southern Rhodesia was small, professional, technical, predominantly white and highly responsive to a narrow white settler constituency. Departmental staff was instrumental in introducing CAMPFIRE (see Chapter 9), game ranching, crocodile and ostrich farming, and elephant management. Quality ecological research laid the foundation for management decisions, though monitoring was negligible. After independence, the department became increasingly linked to a politicized central government in which meritocracy was replaced by patronage in the management staff, steadily reducing performance (Child, McKean, Kiss, Munthali, Jones, Mtsambiwa, Castley, Patton, Magome, Pangeti, Fearnhead, Johnson & Chilikusha, 2004a *In:* Child, B., 2004a).

Similar to Chabal and Daloz (1999), this case study (Duffy, 2000) argues that pre-colonial social systems, such as lineage and ethnicity, appropriated colonial institutions at independence. It also demonstrates the influence of Western donors and NGOs on the politics of sustainable use.

At independence in 1980, the DNPWM was largely made up of white technicians and managers. The department became divided into two factions (Duffy, 2000): 1) “Conservation faction”, made up of Willie Nduku,³⁴⁹ Rowan Martin³⁵⁰ and Gordon Putterill,³⁵¹ and 2) A “patronage alliance faction”, made up of Willas M. Makombe, a former school teacher with no experience in wildlife management, but closely allied to the ruling party ZANU-PF and the Permanent Secretary of the Ministry of Environment and Tourism, Tichafa Mundangepufupfu.

The “conservation faction” was heavily supported by western NGOs and donors, including the World Bank, USAID and GTZ. The “patronage alliance faction” used the issue of indigenization and black empowerment as a smokescreen to gain control over resources and power (Duffy, 2000).

A number of scandals broke out in the early 1990s, accusing the “conservation faction” (Nduku and Martin) of misusing their powers to sell and/or exchange black rhino (International Rhino Foundation) and elephant (translocation of 500 elephant during the drought from Gonarezhou to Pilanesberg Park, Bophuthatswana – now a provincial park in South Africa) for gifts and/or at below market prices – implying kickbacks, awarding non-competitive translocation contracts to ex-park employees (Clem Coetsee of Wildlife Management Services), stocking white game ranches and conservancies with park estate wildlife, and donor funding (GTZ, U.S. Fish and Wildlife Service

³⁴⁹ Director of Wildlife

³⁵⁰ Deputy Director of Wildlife

³⁵¹ Chief Warden of Gonarezhou National Park

(USFWS), USAID, NGO) bypassing central treasury (Duffy, 2000). Though some allocations seemed to have weight, the majority were never completely proven. The takeover was not entirely political, resorting to violence when deemed necessary. Both the Deputy Director of DNPWM, George Pangeti (*pers. comm.*) and the head of hunting quota setting, Don Heath (*pers. comm.*), had what they believed were orchestrated vehicular accidents with government armored personnel carriers, with messages being sent out that if they enjoyed their lives, they should consider leaving government, which they both did. One cannot forget the value of wildlife to an unscrupulous political elite if they control and use the distribution of its access as part of a clientele patronage power base, as described above by Chabal and Daloz (1999).

The net result was a takeover of the department by the “patronage alliance faction” and the misuse of estate wildlife by elite such as Vice President, Joshua Nkomo and his abuse of VIP (Very Important Persons) hunting privileges to allow investors in his hunting operation 30 free hunts in the Parks and Wildlife Estate, allegedly over-hunting the area using unethical practices (e.g., baits at waterholes, shooting from road and at night). There were also strong rumors of organized poaching rings within DNPWM, which could now operate more freely (Duffy, 2000).

This power struggle did much to discredit Zimbabwe among donors, who began channeling funding through NGOs, and at international forums such as the Convention on International Trade in Endangered Species (CITES) (Duffy, 2000), where under the conservation faction, Zimbabwe had been on the cutting edge of modern concepts such as community based natural resources management (CBNRM) and adaptive management through programs such as CAMPFIRE. The politics behind this case study are steeped in intrigue and rumor. What one can be sure of is that what appears to be a “white patronage faction” was ousted

by a “black patronage faction” in political control and power of what had become the second most valuable resource in Zimbabwe after mining; wildlife.

11.6.3.2 Corruption

The Commission for Africa (2005) found that

“Corruption is systemic in much of Africa today. It is another of Africa’s vicious circles: corruption has a corrosive effect on efforts to improve governance, yet improved governance is essential to reduce the scope for corruption in the first place. All this harms the poorest people in particular because it diverts funds away from providing the services they need more than anyone else in society and they are likely to have to pay a higher percentage of their income in bribes...The rot of corruption has spread throughout society at all levels”.

The German-based Transparency International Corruption Index (2006a) rated Sub-Saharan African countries among the most corrupt in the world (Table 11.2) based upon perceived abuse of public office for private gain from 12 different polls and surveys from nine independent institutions. A score of 5.0 is the number Transparency International considers the borderline figure, distinguishing countries that do and do not have a serious corruption problem (Infoplease, 2004).

Table 11.2 : 2006 Corruption Perception Index (CPI)

Country Rank	Country	2006 CPI Score (1)	Confidence range
1	Finland	9.6	9.4 - 9.7
11	United Kingdom	8.6	8.2 - 8.9
18	France	7.4	6.7 - 7.8
20	USA	7.3	6.6 - 7.8
37	Botswana	5.6	4.8 - 6.6
51	South Africa	4.6	4.1 - 5.1
55	Namibia	4.1	3.6 - 4.9
70	Egypt	3.3	3.0 - 3.7
70	Ghana	3.3	3.0 - 3.6
70	Senegal	3.3	2.8 - 3.7
79	Burkina Faso	3.2	2.8 - 3.6
79	Lesotho	3.2	2.9 - 3.6
84	Madagascar	3.1	2.3 - 3.7
84	Mauritania	3.1	2.1 - 3.7
90	Gabon	3	2.4 - 3.3
93	Eritrea	2.9	2.2 - 3.5
93	Tanzania	2.9	2.7 - 3.1
99	Mali	2.8	2.5 - 3.3
99	Mozambique	2.8	2.5 - 3.0
105	Malawi	2.7	2.5 - 3.0
105	Uganda	2.7	2.4 - 3.0
111	Zambia	2.6	2.1 - 3.0
121	Benin	2.5	2.1 - 2.9
121	Gambia	2.5	2.3 - 2.8
121	Rwanda	2.5	2.3 - 2.6
121	Swaziland	2.5	2.2 - 2.7
130	Burundi	2.4	2.2 - 2.6
130	Central African Republic	2.4	2.2 - 2.5
130	Ethiopia	2.4	2.2 - 2.6
130	Togo	2.4	1.9 - 2.6
130	Zimbabwe	2.4	2.0 - 2.8
138	Cameroon	2.3	2.1 - 2.5
138	Niger	2.3	2.1 - 2.6
142	Angola	2.2	1.9 - 2.4
142	Congo Brazzaville	2.2	2.2 - 2.3
142	Kenya	2.2	2.0 - 2.4
142	Nigeria	2.2	2.0 - 2.3
142	Sierra Leone	2.2	2.2 - 2.3
151	Côte d'Ivoire	2.1	2.0 - 2.2
151	Equatorial Guinea	2.1	1.7 - 2.2

156	Sudan	2	1.8 - 2.2
160	Guinea-Conakry	1.9	1.7 - 2.1

Source: Transparency International (2006). (1) CPI Score: 10 Highly Clean, 0 Highly Corrupt

However, what the West might consider as corruption becomes acceptable to those who keep the “Big Men” in power as long as this wealth is redistributed to the support base. Guest (2004) gives the example of ethnic solidarity being used to justify corruption, as Nigerian politicians scramble for petrodollars for themselves and their ethnic support base that keeps them in power. Likewise, the copper mines of Zambia were systematically looted in the 1990s under the Chiluba government as a source of patronage, worse than under Kenneth Kaunda (Guest, 2004). Nigeria and Zambia are just examples of what has been, and is still, common place all over the subcontinent.

Under the current administration of Kenyan President Mwai Kibaki’s anti-corruption campaign, four senior government officials signed a nearly 40-million-dollar deal to purchase passports and other equipment for the country's immigration office through a mysterious front company. The project fell through, and the four officials were suspended, but many believe Finance Minister David Mwiraria should be held accountable. Official corruption under the Kibaki government has cost Kenya almost 200-million-dollars in lost revenue (Ryu, 2004).

11.6.3.3 Corruption and the extended family

When the principal author was in West Africa, one had to be careful, and rightfully so, that secretaries and chauffeurs were treated with the greatest respect since, through the patronage system, they might be close relatives of the High Commissioner of the Gambia River Basin (OMVG) and other influential politicians. In reality, this is not much different than that described by July (1970) in Chapter one, in which the Sudanic kingdoms’ administrative and power base were build on relationships with clans, lineage and age groups; this system going back centuries.

In the late 1980s when the principal author was the environmental advisor to the OMVG,³⁵² he was called into the office of the technical director, Mamour Gaye (*pers. comm.*), an irrigation engineer where he was told, “I (Mamour) am one of the best paid professionals in West Africa, but I have no money. At the end of the month, my aunts, uncles, brothers, sisters, father, mother, cousins, nieces and nephews arrive and all of my salary is distributed. I have no bank account”. He went on to say, “remember this as you will be faced with it all your life if you continue to work in Africa; the basis of corruption in Africa is the extended family”. The principal author replied that this support network of the extended family was a good thing, something lost in the West where those who have, take care of those who have not within the family, so no one goes hungry. Mamour replied, “Yes this is true, but you are under so much pressure to provide for ‘the family’ it is wrong to steal, but well it is not that wrong if it is for the family”.

Thus, what we as Westerners consider illegal, may also be considered illegal in the African context, but be considered legitimate and not criminal by the extended family in the current setting of declining and/or stagnating economies on the subcontinent. It becomes a question of survival. Thus, in Sub-Saharan Africa, Chabal and Daloz (1999) call this “the moral economy of corruption” or “an economy of affection”. In Sub-Saharan Africa, there is “a marked reluctance to abide by the abstract and universalist norms of the legal-bureaucratic order that are the foundations of Western politics” (Chabal & Daloz, 1999). Communal codes of conduct become more important than individual codes of conduct, following the norms of pre-colonial Africa, such as obligations of mutual support, imperatives of reciprocity, gift exchange, payment of tribute, etc. (Chabal &

³⁵² Gambia River Basin Development Organization/*Organisation Pour la Mise en Valeur du Fleuve Gambie* (OMVG)

Daloz, 1999). This impacts both the business world and the world of good governance.

Another major constraint with the “culture of the extended family” that prevails in much of Africa is that it is a hindrance to entrepreneurialism in the modern world. While in the historical past of rural settings, it helped assure survival, in a global capitalist moneyed economy it becomes a form of welfare where one person supports large numbers, who then, as in all welfare systems across the world, lose their appetite to compete, being content to live from handouts. Foreign aid has taken advantage of this situation during the Cold War, developing global welfare from food aid to development aid. One problem is that currently, even if many young people living on this extended family welfare wanted to work, there are no jobs, so that they become caught up in an endless cycle of hopelessness and despair. These problems, from the cultural constraint of the extended family to job opportunities, must change if Sub-Saharan Africa is to have a future, of which there is no reason why it should not be one of the richest continents in the world.

The African form of governance thus becomes based on what Chabal and Deloz (1999) call “unequal reciprocity”, in which there is a trickle down to the bottom of the social order in exchange and recognition of the status and power of the provider. Thus, the patron-client relationship between the political elites and their clientele, to whom wealth is redistributed, results in a vertical form of accountability. If the elite abuse their wealth, meaning limited redistribution, they lose their support base and power to another “big man”/elite willing to be philanthropic to his/their constituency. Ostentation by the elite is not objectionable to the majority, as long as they benefit and its display (e.g., mansions, expensive cars and clothes) by the elite is a symbol of the collective “communal” prominence of vertical redistribution. The abuse of this system is

seen when “Big Men”, like Idi Amin of Uganda, Mobutu Sese Seko of Zaire and Moi of Kenya, stay in power at all costs. Once voters determine that politics is a struggle between ethnic groups, the winner grabbing and distributing the spoils, political parties become tribalized (Guest, 2004) instead of ideological.

Parliamentary democracy can work when individuals identify as citizens, as opposed to communal support networks along ethnic and/or religious lines necessary for survival under precarious economic and environmental conditions.

In Africa, individuals are not considered separate from communities. Chabal and Daloz (1999) do not consider “corruption”, as defined above, as necessarily incompatible with democratic systems and not necessarily detrimental to economic growth, giving Japan and the “Asian tigers” as examples. They believe, however, that a major difference is that money from “corruption” in Asia is reinvested back into production, while in Sub-Saharan Africa this wealth is used for instant gratification in the purchase of material goods, or results in overseas flight into foreign banks and thus, is of little value in stimulating Sub-Saharan African economies and long-term development. The continued dominance of commercial capital over industrial capital in Sub-Saharan Africa is a primary characteristic of under-development (Dumont, 1966). Visionaries, such as President Museveni, (see case study below) are experimenting in an “Africanization of Western Democracy” that blends traditional cultures and value systems with the concept of modern nation states and governance (see Section 11.6.6.2, Uganda, democracy, civil war and attempts to find an African solution). Ultimately, it must be accepted that there are well-recognized African norms of political practice, which do not conform to those found elsewhere.

Ultimately, to escape this endless cycle will likely require growing economies where the majority will have the opportunity to obtain gainful employment, decreasing the financial importance of kin networks in everyday survival.

Cultures change with economic times. Also, as societies become more literate and affluent, have better access to the media and global communications, governments will be held more accountable for their actions and corruption should be less of an issue (Sachs, 2005). Currently, corruption among African governments is no more or less than other countries at the same income level (Sachs, 2005).

11.6.4 Dangers of Economically Repressed Majority Being Handed Political Power through One Man One Vote Elections

As will be seen in discussions over Rwanda and Burundi (see Chapter 5, 5.9.4.6, Deforestation in afromontane forests, Rwanda, over-population and land degradation linked to deforestation for agriculture and political destabilization and Chapter 13, Section 13.8.6, Former Cold War Allies Vying for Power in the Great Lakes Region), Uganda (see Section 11.6.6.2, Uganda, democracy, civil war and attempts to find an African solution) and Zimbabwe (see Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife), Yale law professor, Amy Chua (2003), herself an ethnic Chinese minority from the Philippines, believes that the export of free-market democracy, that is one man, one vote elections and *laissez-faire* capitalism (basically structural adjustment (SAP) and “free-market” economic policies, which the West has never followed itself) in many developing countries where there is a “market-dominant minority” (e.g., Tutsi in Rwanda and Burundi, Bugandans in Uganda; whites in Zimbabwe, South Africa and Namibia; Lebanese in West Africa and Indians in East Africa), is a recipe for disaster. The impoverished majority takes control politically, resulting in a sudden and often violent rise in “ethno-nationalism” where, in the extremes, there may be outright genocide (e.g., Rwanda and Burundi) or attempts to take economic control, that if not carefully thought out, can be disastrous (e.g., when land reform becomes

politicized as in Zimbabwe). “‘Ethnic dominance’ - where the largest ethnic group is between 45 and 90% of the population - increases the risk of conflict by 50%” (Commission for Africa, 2005).

In such situations, creating an educated majority middleclass and not just an educated, but economically frustrated majority underclass, may be more important than a sudden change towards democracy in creating long-term peace and stability in Sub-Saharan Africa. This allows the majority to escape the shackles of the extended family, or at least the negative aspects thereof, as well as ethnic “Big Men” patronage systems. Leistner (2004) believes that modern communications (e.g., radio, television, the internet, film, etc.) combined with literacy is beginning to result in pressure from below by the impoverished majority for a better life that may no longer accept the status quo where a few live the good life at the expense of the majority.

11.6.5 Cultural Crisis and Democracy

Leistner (2004) sees the above as a profound cultural crisis for Sub-Saharan Africa. Africans, in their daily lives, have to contend with two fundamentally different cultures; one rooted in traditional African communalism, forcing successful family members to share and distribute their wealth among kin, to one rooted in Western individualism and the accumulation of materialism that today forms the basis of capitalism. Many are trapped between these two worlds and their implied obligations. Leistner (2004) sees Sub-Saharan Africa’s foremost problem as one of an inescapable need to come to terms with the conflicting demands of African traditions and the modern world. He believes that Afro-centrism that discredits Westernization is not the answer.

The authors believe that in the 21st century, the much espoused “African Renaissance” must be based on taking the best from both Western and African cultures and through integration, finding a middle road that allows the use of Western technologies and systems of governance that fit into African societies and cultures. This must link into their traditional knowledge and management systems in the case of wildlife and other natural resources. According to Leistner (2004), President Thabo Mbeki of South Africa is convinced that traditional worldviews and modern (Western) ways can be combined in promoting development. Ayittey (1990 *In:* Leistner, 2004) believes that African development must build on indigenous systems that have been assaulted by the elites after independence. Raum (1961 *In:* Leistner, 2004) believes Africans value modern technology and industry, but reject the egotism associated with the capitalist system. Like Japan, the Soviet Union and the Mediterranean countries, Sub-Saharan Africa must adopt industry and technology without losing its cultures and identities.

In closing, to many, Sub-Saharan Africa seems a hopeless subcontinent lost in continual turmoil. This might be expected after 100 years or more of colonial exploitation, followed by about 40 years of neo-imperialism and eco-imperialism continuing today. As President Yoweri Museveni explains, great democracies emerged from political turmoil and did not happen quickly or elegantly, or without staggering setbacks and agonizing contradictions. The American Revolution required eight years of fighting, five more years to get a Constitution ratified and another two years before elections were held – a total of 13 years after the Declaration of Independence was proclaimed (Gourevitch, 1998). In the West, development came with the revolutionary liquidation of feudalism. The autocrats will not willingly give up their arbitrary powers and unlimited privileges (Ake, 1976 *In:* Leistner, 2004). “Only when ordinary men and women have a cause to reject the logic of personalized politics, seriously to question the legitimacy of the

present political instrumentalisation of disorder and to struggle for new forms of accountability will meaningful change occur" (Chabal & Daloz, 1999 *In:* Leistner, 2004).

Let us hope that the new generation of 21st century Sub-Saharan African leaders, along with the enlightened youth, undoubtedly well aware through information technology (IT), will throw off the cloak of colonialism/neo-eco-imperialism and lead their people down a path that is best for Africa as opposed to benefiting a few elite, the West, and/or their multi-nationals. Only Sub-Saharan Africa can find its way to democracy best summed up by French Defense Minister Michele Alliot-Marie,

"We know that democracy can't be decreed and, for the graft to take, it has to take into account the historical and socio-cultural realities of the countries where it is being implanted" (Sands, 2004).

Leistner (2004) places much pressure on South Africa to show the way to the rest of Sub-Saharan Africa. Leistner believes that if South Africa fails to get it right, Sub-Saharan Africa will face anew the specter of colonialism only this time: 1) Pleading to be colonized and 2) No one will be in a hurry to colonize. The authors would agree with one caveat, democracy can't be imposed or "implanted" from the outside, but must come from within – from the people and their society – it must be something they want, not something we, the West, want for them.

11.6.6 Attempts at Finding African Solutions to Democracy

"If Africa is to move ahead, it must find a system of government that checks the whims and recklessness of its rulers and is responsive to the needs and aspirations of the people at large" (Leistner, 2004).

“...Africans are ordaining a hierarchy that maximizes foreign values and minimizes national values. Knowledge and experience are not shared across the generations. To change this presupposes a new generation of African leaders, ‘no longer willing to have the continent’s resources perennially pillaged and devalued, no longer willing to have the continent’s people, languages and cultures serve as cannon fodder in war between the imperialists’ ” (Ayi Kwei Armah³⁵³ writing in the *West Africa Magazine* In: Rosenblum & Williamson, 1987).

Chabal and Daloz (1999) consider multi-party democracy and Western norms a façade of the state to placate donor requirements necessary to receive foreign aid, what President Museveni of Uganda calls “cosmetic democracy” (Gourevitch, 1998). Museveni believes that there are certain commonalities such as universal suffrage, one person one vote by secret ballot, a free press and separation of powers (Gourevitch, 1998). Beyond this, Museveni believes that democracy must fit within the socio-cultural make-up of a society as opposed to the “new political religion” of multi-party elections as a cure-all for the world political ills, based on “ignorance” and “arrogance” (Gourevitch, 1998) of the West. Finding African solutions to democracy will be critical, as without a stable political environment that creates an enabling environment in which the private sector can function, the adoption of good land husbandry and sustainable conservation practices, along with economic development, cannot occur. The following are attempts to find African solutions to democracy.

³⁵³ Ghanaian novelist and poet born in 1939 whose writings deal with the problems of post-colonial Ghana.

11.6.6.1 The Katanga story, an “African solution” to democracy thwarted by the “Cold War” and beginning of French/American struggle over a quest for Africa’s riches

“ ‘Tomorrow or the day after, there will be a trial of strength. Let us prepare for it. Let Katangan fighters arise at the given moment in every street, every lane, every road and every village. I will give you the signal at the opportune time. You will not be able to have guns and automatic weapons but we will still have our poisoned arrows, our spears and our axes...We are here, resolved to fight and die if necessary. The United Nations may take our cities. There will remain our villages and the bush. All the tribal chiefs are alerted. We are savages; we are Negroes. So be it. We shall fight like savages with our arrows’ ” (Katangan President Moise Tshombe *In: Hempstone, 1962*).

“It is evident that the objective pursued by the UN troops is the complete destruction of the economic potential of Katanga, a policy aggravated by total disregard for human life” (*Union Miniere In: Hempstone, 1962*).

“Tshombe also directed a public appeal to ‘the free and civilized world to end this barbarous and useless carnage.’ In an obvious reference to the U.S., Tshombe charged that a ‘great power that itself prizes liberty’ was encouraging and financing the United Nations’ intervention in Katanga” (*Hempstone, 1962*).

“A political solution created by force would not survive the departure of the bayonets that imposed it...If the UN had existed 2 centuries ago, would it have been right for it to prevent the secession of the 13 American colonies from Britain or that of the South American nations from Spain and Portugal” (*Hempstone, 1962*)?

History of Katanga Province

The history of Katanga Province and Congo Belge, eventually Zaire, becoming the present-day Democratic Republic of Congo (DRC), stems back to the Cold War and the fear of a “Red Congo” controlled by the Russians. It also has to do

with the incredible riches (copper, diamonds, cobalt, germanium, manganese, zinc, cadmium, gold, silver, iron, tin, and coal) of the Katanga Province and early on, an attempt by the United States, using the United Nations as a proxy, to take control of this wealth. This sets the stage for the modern-day Anglo-Franco rivalry of the Post-Cold War for the riches of Sub-Saharan Africa (see Chapter 13, Section 13.8, FRANCE/US ANGLOPHONE COMPETITION FOR INFLUENCE AND RESOURCES IN AFRICA – NEW SCRAMBLE FOR AFRICA).

Smith Hempstone, former foreign correspondent for the Chicago Daily News and Washington Star, associate editor of the Star and editor-in-chief of the Washington Times, as well as U.S. Ambassador to Kenya in the early 1990s (Hempstone, 1997), provides an excellent overview of this tragic history in *Rebels, Mercenaries and Dividends, The Katanga Story* (Hempstone, 1962).

The battle for Katanga's riches began in the mid-1800s with the rise of the Bayeke kingdom under M'Siri, who monopolized traffic in slaves, ivory and copper, salt and iron to purchase arms and ammunition, enabling him to defeat even more tribes and expand his territory. He was a competitor for power over the Lunda and Baluba kingdoms, maintaining good relations with the Lunda and defeating the Baluba. His capital, Bunkeya, became the greatest trading center in Central Africa with a population of 20,000 and a harem of 600 wives by which he sealed allegiances through marriage. The Belge under King Leopold II, to whom the Congo Free State personally belonged – not to Belgium, and the British through Cecil Rhodes, vied for control over this area and its natural resources. After a shootout in 1891, in which the aging M'Siri was killed, the Belge negotiated with his eldest son and successor to fly the flag of the Congo Free State (Hempstone, 1962).

Congo Belge (the modern Democratic Republic of Congo) was Belgium's creation, with neither ethnic nor geographical meaning, carved out of Africa's heart in the late 1800s. The Belgians provided the link that provided a semblance of unity to this vast territory. The unity of the Congo was never more than a political fiction based on the façade of a common Belgian colonial administration, effectively concealing the fact that Congo Belge was not one, but several contiguous territories (Hempstone, 1962). This appears to remain the case at the beginning of the 21st century.

Eventually, the wealth of the Katanga was to be shared by the Belge and British, primarily through the Union Minière (mining company) and the British owned Benguela Railway, running from the headquarters in Elizabethville (current Lubumbashi) to the Angolan Coast. The Union Minière, and thus Katanga province, accounted for 20% of Congo Belge's Gross National Product (GNP) and 45% of its revenues, half of which were returned to Katanga for its local budget. This resulted in Katanga contributing 25% to the budgets of the other five provinces. The province had world class schools and hospitals. It was an industrialized area in which housing for workers was free and had the highest wages in Africa. Food, seed and fertilizer for gardens were subsidized, along with free medical care, health and disability insurance, paid vacations and old age pensions (Hempstone, 1962). One could argue that to some degree, this could be a model for what one would hope for Sub-Saharan Africa in the 21st century under NEPAD and AGOA (see Chapter 13), though possibly with more racial equity between management and workers, since there existed a privileged white upper and middleclass. However, one will see that both whites and blacks fought side by side against the U.S. backed United Nations peace keeping forces to maintain this unique aberration.

Moise Tshombe, Joseph Kasavubu and Patrice Lumumba

The key player of this story is Moise Tshombe, a descendant of royalty from the Lunda tribe, whose father, an entrepreneur, was Congo's first self-made African franc millionaire. He founded Katanga's first political party, the Confederation des Associations du Katanga (CONAKAT), consisting of 17 tribes, but dominated by the Lunda. His second in command was Munongo, a Bayeke. Tshombe was a tribal nationalist, believing the tribe should form the center of the nationalist movement – but he was not a racist or ethnic as he accepted all tribes and whites into his vision for the future. He was pro-Western and opposed centrally controlled governments as preferred by his hated rival, Patrice Lumumba. He liked the American model of federal government and states. Tshombe wished a federation, confederation and/or as a last resort, succession due to the vast historical, linguistic, tribal, geographic, economic and political differences over this vast territory. He was willing to share 50% of the wealth from Congo Belge's richest province with the rest of the country. He was supported by the Union Katangaise (political party of white settlers) who feared centralized control under radical Africans from the north, and he had strong support from the majority of the Katanga Province's tribes. He was anything but a puppet to the Union Miniere and the whites (Hempstone, 1962).

Joseph Kasavubu was from the Bakongo tribe and, like Tshombe, believed in political foundation on the tribe. He spearheaded the nationalist thrust in the Congo starting with the 1959 riots of Bakongo in Leopoldville (modern Kinshasa). Both Kasavubu and Tshombe wished to preserve the fabric of traditional societies. Both were pro-Western and both wished for some level of autonomy for their homelands and reconstitution of their ancient empires (Hempstone, 1962).

The fly in the ointment was Patrice Lumumba of the Batetela tribe who were known as warriors and for their savagery in the Force Publique – formed in 1891 and responsible for the annihilation of nearly 10 million Congolais over 30 years in Belgium’s quest for wild rubber. He was believed to be pro-communist and favored a strong centralized government. Hempstone (1962) believed that the fear of a Russian takeover by the West, through Lumumba and some of his cohorts, was unfounded since the only place where there had been direct communist intervention was into territories contiguous with a communist-controlled land mass such as Korea, East Germany, Indochina, Hungry and Tibet. Congo Belge was a logistical nightmare. This was to be proven in 1965 by Marxist revolutionary Ché Guevara (2001) who left in disgust, claiming that there would never be a communist revolution in the Democratic Republic of Congo (Zaire/Congo Belge). Lumumba was a key player in the Movement National Congolais (MNC), which had some of the best minds in the country (e.g., Joseph Ileo and Cyrille Adoua) and unlike most other parties, which tended to be regional and tribal, had representation country-wide (Hempstone, 1962).

Independence of Congo Belge

The Belgian Government agreed to grant Congo independence on June 30, 1960. Meanwhile, there was an ideological struggle – Kasavubu and Tshombe fighting for a loose confederation, while the Belgian Government and Lumumba favored a strong central government. They managed to push through “*loi fondamentale*” that assured a strong centralized government (Hempstone, 1962).

Katanga Province, under Tshombe, and the Mining State Province, under Kalonji of the Baluba tribe, legally seceded before the “*loi fondamentale*” could be ratified (Hempstone, 1962).

Meanwhile, Belgium asked Lumumba to form a government, in which he failed by using bribery, bullying and tribal rivalries. Even though he was a federalist, Kasavubu was brought in and became President, while Lumumba was named Prime Minister. Though disappointed, Tshombe agreed to be a part of this coalition government (Hempstone, 1962).

Before the country was a day old, Lumumba insulted King Baudouin of Belgium, accusing the Belgian monarchy (and rightfully so) of contempt, insults, hangings and shootings under its colonial rule. By July 4th, 1960, troops from the Force Publique mutinied for higher wages. It was at this stage that an obscure former army sergeant turned journalist, Mobutu Sese Seko (born Joseph-Désiré Mobutu), was named chief-of-staff. Although disavowed by Lumumba, Tshombe called in Belgian troops to stop the rape and murder of Belgian citizens. The net result was a temporary reprieve, but a rupture with Belgium and a deterioration of the fragile coalition between Lumumba and Kasavubu, resulted in the Congo becoming a pawn on the African chess board of the Cold War (Hempstone, 1962).

Katangan Session

Two weeks later, on July 11, 1960, Tshombe's Katanga Province seceded declaring itself a free and independent nation. Four days later, the UN Security Council authorized international intervention in the Congo and called on Belgian troops to withdraw. Hempstone (1962) believed that intervention by the UN was illegal under the UN charter, as this was a case of intervention in internal affairs of a country. The United States was paying 33% of the UN's running costs and 50% of its Congo operations. The USA fully supported these illegal operations by the peace keeping forces or "Blue Hats" of the UN. Hempstone (1962) felt that the John F. Kennedy Administration was shortsighted and unethical in its

support of their interventions. Secession took place only because Tshombe and other federalists were unable to obtain a realistic constitution.

Their attempt to create a federalist system at a meeting of Congo Belge's political leaders in Antananarivo, Madagascar, was rejected by the UN and the U.S. because it did not fit their doctrinaire theories of political science, America's fears over communism (Hempstone, 1962) and possibly America's desire to control Katanga's vast natural resources. Federalism was a Congo solution to a Congo problem similar to Yoweri Museveni's Uganda of the 21st century, but that was not good enough for the United States.

Mobutu Sese Seko

Meanwhile, the 31 year old Chief of Staff of the Army, Mobutu Sese Seko, seized control of power. However, he proved weak, forcing the UN and the U.S. to consider returning Lumumba to power after he had been fired as prime Minister by Kasavubu. Placed under arrest by Mobutu, a plane with Lumumba and some of his aids was refused landing at Bakwanga, the capital of the Mining State, and was forced to land in Katanga, against the desires of Tshombe being fearful of the political ramifications. Hempstone (1962) believed that Lumumba, was arrested and eventually eliminated in Katanga because of fear by Kasavubu and Mobutu of his return to power, or mistakenly beaten to death and/or killed while trying to escape. Madsen (1999) believed the Central Intelligence Agency (CIA) of the United States, in collaboration with Mobutu Sese Seko's men was behind his elimination in Katanga in February 1961, fearing his ties to the Russians. There does not appear to be substantial evidence as to what, if any, role Tshombe played in Lumumba's death. Meredith (2004) indicates that while the CIA had planned to assassinate Lumumba, ultimately it was undertaken by a firing squad under a Belgium officer with complicity by Tshombe.

By March 1962, 75 tribal chiefs from all parts of Katanga published a *communiqué* “disapproving of the conduct of the United Nations toward the Katangan people” and alleging that the UN was in the Congo to help the United States appropriate for itself Katanga’s copper and South Kasai’s diamonds (Hempstone, 1962).

Eventually, Tshombe came into the fold, being placated by being offered the post of Premier of the Congo. However, the CIA believed that Tshombe was too close to the Belgian and French mining interests and *Monsieur Afrique*, Jacques Foccart, who controlled France’s African policy, even though he protected American mining interests in Katanga Province. In 1961, former President Herbert Hoover, former Vice President Richard M. Nixon and Senator Barry Goldwater from the USA had even established a pro-Tshombe American Committee for Aid to Katanga (Madsen, 1999).

Again, in 1965, the U.S. gave the green light to Mobutu Sese Seko to stage another coup, ousting the feuding Kasavubu and Tshombe. Tshombe went into exile in Madrid. The Katanga secession was over. The CIA still saw Tshombe as a threat and wanted him eliminated. Against warnings from the French, Tshombe flew to Algeria to meet with the Americans, where on he was arrested and incarcerated in Algiers until 1969, where he succumbed to a heart attack. Mobutu Sese Seko consolidated his powers and provided America a stage from which to launch its ideological wars on the continent against the Russians, especially in support of Savimbi’s National Union for the Total Independence of Angola /*União Nacional Para a Independência Total de Angola* (UNITA) in Angola. Mobutu Sese Seko developed close ties with American businessmen and politicians and became reportedly one of the richest men in the world from “western economic assistance”, skimming foreign aid money (Madsen, 1999). Between 1965 and 1988, U.S. aid to Zaire totaled US\$ 860 million. Mobutu Sese

Seko retained close relations with U.S. presidents from Kennedy through George Bush Sr. (Meredith, 2004).

America and France Vie for Control

The United States had supported Mobutu Sese Seko, while Foccart and de Gaulle had supported Tshombe and Kasavubu, resulting in the beginning of a rift between France and the United States over African policy (Madsen, 1999) that is still being fought out on the continent today. For over 30 years, Mobutu Sese Seko enriched himself off the country's riches and foreign aid, while America and the West closed their eyes as long as the "little fish remained obedient to the shark". Some say he pocketed as much as US\$ 4 billion and murdered opponents "under the benevolent gaze of Washington" (Rosenblum & Williamson, 1990). By 1986, the United States was providing Zaire with US\$ 70 million/year, some of which was channeled to Jonas Savimbi's UNITA guerrillas in Angola. President Ronald Reagan declared the visiting Mobutu Sese Seko "a voice of good sense and good will" (Rosenblum & Williamson, 1990).

"During the Cold War, the United States shipped \$US 1.5 billion in armaments to African military forces, including \$US 400 million in arms and training to the Mobutu regime in Zaire (now the DRC) and over \$US 250 million to Jonas Savimbi's UNITA forces in Angola" (Hartung & Montague, 2001).

Once the "sharks" had no more use for the "old man", they decided it was time to eliminate him. Thirty years later, he would have served his purpose, finding himself in a similar situation to that of Lumumba and Tshombe (Madsen, 1999), when in the late 1990s he had become dispensable to American foreign policy in the Great Lakes/Central African region. Ironically, in the late 1990s, it was France who supported Mobutu Sese Seko, while America favored and helped put the

Anglophone, Joseph Kabilo, in power (see Chapter 13, Section 13.10.3.1, U.S. government involvement in the Democratic Republic of Congo).

Unfortunately, today the Democratic Republic of Congo has become the site of “Africa’s First World War”, which has set Uganda, Burundi and Rwanda against the Democratic Republic of Congo, Zimbabwe, Angola and Namibia; with manipulation by Western multi-nationals and governments behind the scenes of who controls land and mineral wealth (see Chapter 13, Section 13.10.3, Congo-Kinshasa DRC, Africa’s world resource war). As usual, the wildlife and the people suffer to the benefit of a few; national and international elites.

11.6.6.2 Uganda, democracy, civil war and attempts to find an African solution

While Uganda’s role as a proxy to American hegemony in East and Central Africa is a major issue (see Chapter 13, Section 13.8.6, Former Cold War allies vying for power in the Great Lakes Region and Section 13.10.3, Congo-Kinshasa DRC, Africa’s world resource war), its innovative role at Africanizing democracy cannot be denied.

First Attempts at Multi-Partyism Result in Religious and Ethnic Civil War

Multi-party elections in Uganda resulted in a 15-year civil war and a 95% reduction in wildlife populations, with elephant populations virtually eliminated. The past history of Uganda was religiously and tribally divided parties (Museveni, 1997).

Colonialism and Exasperation of Ethnic/Religious Cleavages

Both “tribal/ethnic” and religious cleavages existed. In many cases colonialism helped to exasperate these cleavages, for instance by setting aside land for the exclusive use by war-like Karamojong pastoralists that was closed to other

groups. This had unintended side effects, such as marginalization and isolation of such groups from the development process, and is today increasing the difficulty of integrating these communities into a peaceful Ugandan environment (Kirk, 2000 *In: McCarthy, Swallow, Kirk & Hazell, 2000*).

Any resistance by the monarchy to manipulations in how their monarchies functioned as part of a “British assisted Indirect Rule”, resulted in kings being deported by the British (e.g., King Mwanga of Buganda and King Kabarega deported to the Seychelles in 1899 and Kabaka Mutesa II of the Bugandan kingdom, temporarily deported to England in 1953). In March 1962, the London Conference ratified a constitution recognizing five federated kingdoms in Uganda. Various parties were split along religious and ethnic lines. For instance, the Bugandan government was dominated by protestants linked to the *Kabaka* (title for the King of Buganda), eventually forming the Kabaka Yekka (KY) party or “The King Alone”. Catholics, who made up the majority of Buganda’s population, formed the Democratic Party (DP), which was eventually almost outlawed in Uganda. Meanwhile, Milton Obote’s (a Nilotc from the north) Uganda People’s Congress (UPC) had its power base outside of the Buganda Kingdom. The UPC had the support of Protestants and Bairu (Iru - same as Hutu in Rwanda/Burundi – farmers) in the Ankole Kingdom. In reaction, the Bahima (related to the Tutsi of Rwanda and Museveni’s ethnic group) of the Ankole Kingdom, and even Catholic Bairu, allied themselves with the DP, igniting both a religious and largely ethnic split. In the Bunyoro Kingdom, an anti-Buganda feeling existed, since at independence the Kingdom of Buganda refused to give back sacred sites and thus, territory claimed by the Kingdom of Bunyoro. Thus, the Uganda People’s Congress (UPC) dominated in Bunyoro. The Kabaka Yekka (KY) tended to dominate politics in Buganda and the UPC the remainder of the country. At independence in 1962, Milton Obote was declared Prime Minister (Chrétien, 2003).

It is believed that the counter-balance of religion and the openness of Uganda to the outside world helped it from going down the same socio-ethnic path as Rwanda and Burundi. Thus, Uganda obtained independence in an atmosphere more regionalist (kingdoms) than nationalist, but which allowed the northern Nilotic culture groups to take political power (Chrétien, 2003).

Obote and Idi Amin - “President for Life, Conqueror of the British Empire”

In 1964, the UPC won a majority. Obote took control of an army mainly made up of northern Nilotics. In 1966, he suspended the Constitution and declared himself President. In May 1967, he forced the *Kabaka* (king) of Buganda into permanent exile and abolished all monarchies. In 1971 Idi Amin Dada of the Kakwa Nilote ethnic group, self-proclaimed “His Excellency President for Life Field Marshal Al Hadji Dr. Idi Amin, VC, DSO, MC, King of Scotland, Lord of All the Beasts of the Earth and Fishes of the Sea and Conqueror of the British Empire in Africa in General and Uganda in Particular”, took over in a *coup d'etat* leading to 15 years of civil war, tortures, massacres and economic collapse with complicity by the West (Chrétien, 2003). Up to 400,000 people were believed to have perished under his rule. In 1971, he expelled all Asians (BBC, 2003) primarily of Indian origin who followed the construction of the railroad from Mombassa to Kampala. The Indians had controlled much of the local commerce (*dukas* – shops), imports and exports such as sugar cane, cotton, etc., displacing the ancient commercial network that had functioned for centuries (Chrétien, 2003).

Amin fell in 1979 with intervention by the Tanzanian military, helping to put Obote, a fellow socialist colleague of Tanzanian President Julius Nyerere, back into power. Amin was given asylum and a state pension by Saudi Arabia where he passed away in 2003. In July 1985, Obote was replaced by a military council run by two generals, the Tito Okello and Bazilio Olara-Okello, from the Nilotic Chili tribe. As many as 100,000 people were killed by this leadership. Some estimate the deaths between Amin and Obote to be as high as 750,000 (Rosenblum &

William, 1987; 1990). The regime was supported until its end by the World Bank and International Monetary Fund (IMF). Chrétien (2003) calls the IMF and World Bank the “New Diviners and Initiates” equivalent to the traditional religious leaders who anointed monarchs, only today the religion is the Dollar and Euro.

Yoweri Museveni and No-Party Democracy

The Nilotic dominated army fought a five year civil war with Yoweri Museveni, a University of Dar es Salaam graduate and visionary who was an Ankole (Hima lineage) from Uganda and an anti-imperialist who was dismissed as Minister of Defense by Obote. Museveni formed the National Resistance Movement (NRM) in 1981. He created a united front of Bugandans and people from western Uganda, all Bantu-speaking against the new pro-north dictatorship. The 300,000 Tutsi refugees, whom Obote used as a scapegoat and who allowed the confiscation of their livestock by Iru farmers, gladly joined in the fight to oust Obote. In turn, they were supported by Museveni as the Rwandan Patriotic Front (RPF) to put a regime in power in Rwanda with similar ideals (see Chapter 13, Section 13.8.6, Former Cold War allies vying for power in the Great Lakes).

Museveni took over in 1986. His “no-party democracy” was a result of his fear of religion and ethnicity entering into party politics and tearing the nation apart, as described above. He felt that until: 1) Corruption was brought under control, 2) Until a middleclass (implies educated people) with strong political and economic interests developed and 3) Until there was coherent national public debate, political parties risked devolving into tribal factions, or financial rackets of elites, which could lead once again to civil war (Gourevitch, 1998). René Dumont (1966) also warned of the dangers of “European” style democracy in Africa until it reached a high degree of economic development, implying development of an educated middleclass – similar to how democracy evolved in Europe. Like

Museveni, he believed that African countries needed to choose the most suitable political and economic institutions as opposed to copying present-day Europe.

Multi-party electoral competition may have serious unintended effects and may even prove to be deeply destabilizing (Gourevitch, 1998; Chabal & Daloz, 1999) as it may threaten existing patron-client relationships. However, opposition within the no-party state could compete against each other for political power. President Museveni of Uganda has tried to find an African solution to governance (Museveni, 1997). He restored the monarchies, allowing the exiled kings and/or their heirs to return to Uganda. He invited the Indian business community back into the country. As he recognized that development cannot come from above (Chabal & Daloz, 1999) or through centralized planning, he created a bottom-up government.

The Resistance Committee/Council (RC) system of government completely reverses the antiquated top-down decision-making process of bloated centralized bureaucracies that have lost touch with and failed to address the development problems of most African countries. It can be argued that this is a form of federalism. The bottom-up pyramid RC system empowers people beginning at a village (RC 1) level, RC 2 at the parish, RC 3 sub-county, RC 4 county and RC 5 district; each level electing the leaders of the next level (Museveni, 1997). Today they are called Local Councils (LC) with the same number of levels. This system of bottom-up government gives rural-based people more of a say over their destinies, as to how resources will be allocated, and as to how development will take place in a manner that is acceptable to the diverse cultural and ethnic make-up in the different regions of Uganda. The Decentralization Statute of 1993, reconfirmed in the 1995 constitution, gave RCs (LCs) supervisory power over civil servants (Museveni, 1997). Museveni told the people that government bureaucrats are here to serve you. You are not here to serve them. If they do not work with you or do their job, send them back to Kampala (see Section 11.11.3.3,

Rwenzori Mountaineering Service). This was the beginning of finding an “African Solution to an African Problem”. At the same time, he is moving towards the industrialization and modernization of his country, while pursuing universal education for all of Uganda’s citizens.

Political boundaries respect the traditional boundaries of the kingdoms. Ethnicity is fundamental to African identity and can be made compatible with present African modernity that can re-anchor Africa into its rightful history. Politics must be based on, rather than avoid, the ethnic dimensions of the present nation-state, creating a political structure that is both legitimate in the eyes of the population and accountable in its operation (Chabal & Daloz, 1999). Chabal and Daloz (1999) call the modernization process that Uganda is undergoing “re-Africanization” of Western concepts or customs according to local socio-cultural norms. Museveni has been able to combine state rigor with respect for differences (Chrétien, 2003). In 1996, in presidential elections, he defeated the Catholic backed Democratic Party (and some say mostly Bugandan) candidate who had allied himself with the Uganda People’s Congress (UPC). The press is very free as exemplified by the newspaper, the *New Vision*. He has established an excellent system of education and health care and an independent judiciary (Gourevitch, 1998). He is feared by regional leaders who base their control on ethnic hatred and repression. He is currently being pressured by Ugandans and international donors to open up his country to multi-party elections. One must ask, is Uganda or the rest of Sub-Saharan Africa ready for multi-party systems of governance?

The Man or The System?

On the other hand, Museveni has major problems along his borders with various secessionist movements: including (Human Rights Watch, 2004):

- **Lord's Resistance Army (LRA)**, which has been engaged in a long war in the Acholi north of Uganda (1986-present). The conflict has four main characteristics, 1) Struggle between government and LRA, 2) Between the predominantly Acholi LRA and the wider Acholi population, including indiscriminate killings and the abduction of children to become fighters, auxiliaries and sex slaves aimed at cowering the Acholi and discrediting the government, 3) Fuelled by animosity between Uganda and Sudan supporting rebellions in each other's territory and 4) Continues the North-South conflict that has marked Ugandan politics and society since independence with the southerners monopolizing power (ICG, 2004) (see Chapter 13, Section 13.10.3.2, U.S. military aid). In 2007/8, what appear to be never ending peace talks with Uganda are taking place in Juba, Sudan;
- The **Allied Democratic Forces (ADF)** in the west, a diverse coalition of fighters formed in 1995, Sudanese backed Ugandan Islamic fundamentalist and a virulent anti-Christian group based in the Rwenzori Mountains, with bases also in Eastern Congo;
- The **National Democratic Alliance (NDA)**, last heard from in 1995, but recently alleged to have renewed activities in 2002, based in the east of the country.
- The **Uganda National Rescue (Resistance) Front (UNRF) II** in the northwest, operating out of Sudanese bases and partly formed by former fighters in former President Idi Amin's army.
- The **West Nile Bank Front (WNBF)** headed by a former Idi Amin minister and based in the northwest since 1996.
- The Kizza Besigye campaigners and a loose coalition of opposition parties and persons, who together took the name of Reform Agenda, have been targeted by the Ugandan government and accused of starting another rebel group, the **People's Redemption Army (PRA)**, linked to Rwanda and the Democratic Republic of Congo. Besigye was arrested in November 2005, on his return to Uganda from exile, accused of treason.

Time will tell if Museveni is able to bring these diverse groups into the decision making process of his country or if he tries to solve these problems purely by force, and if his system of governance will allow for a smooth transition of the Presidency and/or will he end up exiting like so many other leaders in Africa. The International Crisis Group (ICG) (2004) accuses him of using military force to address the situation to date. Human Rights Watch (2004) claims that, as practiced, the one-party democracy “has significantly curtailed civil and political rights of those who are in political opposition to Museveni’s government”. In early 2004, Museveni was accused of reverting to the classical tactics of the “African Strong Man”. Politicians challenging the one-party state and the 18-year rule of Museveni, are often detained, severely beaten and threatened with death by the uncontrolled security apparatus, originally established to contend with armed rebel groups and crime waves. In 2001, the government established a system of covert “safe houses”—with no oversight by the Ugandan judiciary and no access given to Ugandan government human rights officials. These places of detention facilitate torture and other abuses by shielding abusers from scrutiny. Individuals have been held incommunicado in such places with no contact with family members or lawyers—sometimes for months, being denied medical care despite severe injuries. The constitutional requirement that criminal charges be brought within 48 hours of detention or the suspect is released, is rarely honored in these cases (Human Rights Watch, 2004).

The International Criminal Court (ICC) has agreed to launch a formal investigation into allegations of human rights abuses in Uganda. The information about war crimes was provided by Ugandan President Yoweri Museveni against the Lord’s Resistance Army (LRA). Although President Museveni’s complaints mentioned only the alleged crimes of the Lord’s Resistance Army, human rights groups demanded that the government side be investigated as well. The ICC has agreed to investigate both sides (Butty, 2004). Some say that the war with the

LRA will drag on for a number of reasons, 1) Little is known of the LRA, how it functions and how many rebels there are and 2) Adams Oloo, lecturer in the University of Nairobi's political science department, believes that the north is not a priority for Museveni since it is a difficult place to control and he has determined that the country can be lead without necessarily controlling the north (Majtenyi, 2005).

Concern also exists that Museveni is pushing to change the Constitution that allows him to run for a third term (Geyer, 2005). In July 2005, Museveni used Parliament to erase presidential term limits, the majority of lawmakers receiving US\$ 2,800 each to ensure the measure's passage. Museveni announced that he would run for re-election in February 2005 (Lambert, 2005).

If the above allegations are true, it may be the man and not the Africanized democratic system that has failed. At the end of July 2005, a national referendum was held and 93% of the voters backed reform to multi-party elections. Many people feel like this was a ploy to appease the people and donors since parliament, earlier in July, scrapped a constitutional amendment that limited a president to only two terms. Voter apathy was high, with only 47% of eligible voters turning out, as provisions in the constitution already allow for multi-partyism and this is perceived as part of a plan to become a president for life (Thibodeaux, 2005; Voice of America, 2005). Others say Museveni is under pressure from the Western donors to allow multi-parties, the donors footing a large part of his annual budget (see Section 11.6.7, Foreign Aid and Puppet Governments – “Donor Democracy”).

11.6.6.3 South Africa's democracy, a possible decentralized model adapted to Africa

Countries that have been successful in the transition to democracy have relied very strongly on leadership with a vision for the country committed to democratic governance. After spending 27 years in prison, Nelson Mandela was one of those visionaries (Shiner, 2004). In South Africa's system of governance, much of the power is controlled at the provincial level with provinces dominated by one to a few ethnic groups. Control over access to natural resources such as wildlife is administered at the provincial level. Health and education are centrally funded provincial responsibilities. The amount of income redistributed to the local level depends on the average income/household and the number of rural residents/province. Local authorities can set user charges, property taxes and certain business taxes, but provinces are under the strict oversight of central authorities. Provinces can go into partnership with the private sector and a capacity building fund has been created by central government to allow municipalities to hire expertise as in-house abilities are developed (World Bank, 2000). Some shortcomings are that the ruling party, the African National Congress (ANC) is so strong that there is no counterbalance party to hold it accountable. In places like Kenya, a counterbalance has occurred through political parties forming coalitions. In South Africa, this has occurred, but the opposition parties are too small and thus too weak, serving more as watch dogs than political rivals to date. In addition, at the provincial and national levels, votes are not for individuals, but a party who then appoints individuals. The danger is that appointees may have more allegiance to the party than their constituents at the local level. It is said that in Botswana, which has a House of Chiefs (traditional rulers), parliament is also elected through parties as opposed to individuals. This might be considered as a model with appropriate parts being adapted by the rest of Africa, most importantly because it appears to be working.

However, South Africa's newly emerging democracy has some major hurdles to overcome in early 2008:

- Addressing the arms scandal in a transparent fashion, also being investigated by France, Great Britain, Sweden and Germany,
- Maintaining the independency of the National Prosecuting Authority and their Scorpion unit, currently investigating ANC President Jacob Zuma in the arms scandal and former national police commissioner and head of Interpol, Jackie Selebi's links to organized crime,
- Overcoming shortages in electrical supplies(see Chapter 7, Section 7.4, PEOPLE AFFECTED BY DAMS),
- Overcoming the increasing gap between the thin veneer of rich "Black Diamonds" (new class of wealthy black South Africans) created by black empowerment/affirmative action, and the more than doubling of poverty, from 1.9 million to 4.2 million South Africans living on 1 US\$/day between 1996 and 2005 (BBC, 2007),
- One of the highest crime rates in the world as a result of this poverty, and a flood of low-skilled refugees/illegal aliens as a result of turmoil and a failure to develop in the rest of Sub-Saharan Africa (see Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife)
- No longer along racial but along socio-economic lines, overcoming inequality in education between rich urban and poor township/rural areas, with the result that South Africa tested last in the World in reading comprehension and math (see Chapter 11, Section 11.13.1, Education),
- At the same time maintaining the standards at the university level, and
- Making sure 'fast track" land reform does not become politicized to the point that it destroys South Africa's food sovereignty (see Chapter 5, Section 5.7.4.2, Land reform and South Africa).

11.6.7 Foreign Aid and Puppet Governments – "Donor Democracy"

"The main question would be the moral education of the small fish. They would be taught that the greatest and most beautiful thing is to sacrifice oneself, and that they must believe and trust in the sharks, who determine their future. The small fish would have to understand that their future would be guaranteed only if they learned obedience" (Bertolt Brecht *In: Sogge* (2002a).

As reflected in conservation policies of Chapters three to five, most post-colonial governments were a continuation of colonialism. Many post-independent leaders

were puppets of the Cold War who could not have survived without Western Foreign aid, which allowed(s) them to maintain their repressive regimes at the expense of the economy and their people to the benefit of a few political elites.

“On average, every dollar of per capita foreign aid improves an incumbent autocrat's chance of surviving in office another year by about 4%, even after accounting for a myriad of independent factors. Since the average autocracy gets about \$8 per capita in aid, foreign assistance may boost the survival prospects of poorly performing leaders by 30% or more” (Bandow, 2002).

In 1980, Official Development Assistance (ODA)/foreign aid constituted less than 4% of SSA's GDP, rising to 10% by 1989, nearly doubling from US\$ 7.6 billion to US\$ 15 billion (Meredith, 2004). The World Bank (1992 *In:* Adams & Hulme, 1998) indicates that foreign assistance as a percentage of host country GNP was:

Mozambique - 66%, Tanzania - 48%, Malawi - 26%, Mali - 19%, Uganda - 18%, Kenya - 11%, and Zambia - 14%

In 2004, illustrative examples of the percentage of national budgets dependent on Western donor handouts include:

- Burkina Faso, 56% (Omotoso, 2004).
- Ghana, 46% (Omotoso, 2004).
- Mozambique, 73% (Omotoso, 2004), 70 % (IUCN/SASUSG, 1997).
- Niger, 87% (Omotoso, 2004).
- Rwanda, 95% (Omotoso, 2004), 60% by 1998 (Gourevitch, 1998).
- Tanzania, 78% (Omotoso, 2004).
- Uganda, 58% (Omotoso, 2004), 52% (Geyer, 2005), 40% in 2005, previously greater than 50% (Lambert, 2005).
- Egypt, 60% from America alone (Omotoso, 2004).
- Senegal, 70% (Atakpu, 2003).
- Mali, 79.3% (Atakpu, 2003).
- Sierra Leone, 60% of recurrent budget and 90% of capital budget (Atakpu 2003).

Although not naming specific countries, Peterson (2003) indicates many of the countries of the Congo Basin have national budgets made up of 60% donor

funding. The above “foreign assistance” percentages are believed to consist of Official Development Finance (ODF) that is Official Development Assistance (ODA)/Foreign Aid³⁵⁴ plus lending by multilateral financial institutions (World Bank, IMF, African Development Bank/*Banque Africaine de Développement* (ADB/BAD) plus Other Official Flows (OOF) with too low a Grant Element to qualify as ODA [see Section 11.7.1.1, Overseas Development Assistance (ODA) versus Overseas Assistance (OA)]. In the 1990s, as defined by OECD³⁵⁵, foreign aid or Official Development Assistance (ODA) was still over 40% of all flows (ODA, other official and private) to all developing countries and close to 90% of those received by Sub-Saharan Africa (White & Feeny, 2003) (Table 11.3).

Table 11.3: Percentage of total net disbursement of official and private disbursement/investment to developing countries

	1971-80	1981-90	1991-2001

³⁵⁴ See Section 11.7.1.1, Overseas Development Assistance (ODA) versus Overseas Assistance (OA). Note that OECD and UNDP have slightly different definitions, UNDP's definition of ODA being the same as OECD's definition of Official Development Finance (ODF).

³⁵⁵ “The original member countries of the OECD (as of September 30, 1961) are Austria, Belgium, Canada, Denmark, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. The following countries became members subsequently through accession at the dates indicated hereafter: Japan (28th April 1964), Finland (28th January 1969), Australia (7th June 1971), New Zealand (29th May 1973), Mexico (18th May 1994), the Czech Republic (21st December 1995), Hungary (7th May 1996), Poland (22nd November 1996), Korea (12th December 1996) and the Slovak Republic (14th December 2000). The Commission of the European Communities takes part in the work of the OECD (Article 13 of the OECD Convention)” (OECD, 2004).

In 2002, ODA averaged 74% of total flows for Sub-Saharan Africa, though for many countries it makes up 80-90% of all investments (Table 11.4) (see Chapter 13, Section 13.13.5, Foreign Direct Investment in Sub-Saharan Africa). With the exception of industrialized South Africa and Mozambique, significant Foreign Direct Investment (FDI) appears to be in those countries with oil and mineral wealth. Significant investment in the resource rich countries does not necessarily mean a transformation of society and a reinvestment of this wealth into development. In fact, very often the history has been just the opposite (Chapter 13, THE CURRENT AND FUTURE ROLE OF THE PRIVATE SECTOR IN SUB-SAHARAN AFRICA RESOURCES WARS OR NEPAD?).

According to the Commission for Africa (2005) (see Chapter 13, Section, 13.13.5 Foreign Direct Investment in Sub-Saharan Africa),

“Nigeria, South Africa and Angola – dominate, accounting for 59% (42% in Table 11.4) of all FDI flows to Sub-Saharan Africa. Investment in the extractive industries often thrives on risky conditions and weak governance because companies can strike highly advantageous deals. For example, when the rebel leader Jonas Savimbi was killed, ending the civil war in Angola, the share price of companies with large Angolan diamond interests fell. These extractive industry companies were doing well out of war”.

The issue of resource wars will be described in great detail in Chapter 13.

Table prepared by principal author

The dominance of foreign aid/ODA in the injection of investment in Sub-Saharan Africa has created “Donor Democracy” that has two main features (Omotoso, 2004):

- 1) Empowerment of the state through creation of an oligarchy (elite), and
- 2) Disempowerment of the citizens.

Since the state does not need to collect taxes from its citizens, living off donor handouts and natural resources, the citizens have no real way of holding their government accountable, while the oligarchy's allegiance and accountability is to fulfill the desires of its donors and expatriate private sector partners as opposed to doing what is best for its citizens (Omotoso, 2004). The World Bank (2000) argues that this donor dependency in Sub-Saharan Africa results in many countries development policies "seen as being the prerogative of donors rather than governments". Booker and Minter (2001) argue,

"We maintain that there are integral interrelationships between the global context and the lack of accountability of governments to their peoples. The system works differently from the periods of colonialism or Cold War patronage, but the common element is that the structure builds in rewards for elites that respond to external pressures more than to the demands of their own people".

In essence, foreign aid creates a dependency relationship between Sub-Saharan African governments controlled by an elite and the West. Is it any wonder that economies are so easily manipulated with nonsensical structural adjustment policies (SAPs) imposed on Sub-Saharan Africa by the World Bank/IMF and other financial arms of the West that have been used to manipulate and control Sub-Saharan African economies as a means of accessing cheap raw products (see Chapter 12, Section 12.3.1, IMF and The World Bank)? As long as the oligarchy kowtows to the West, aid money keeps flowing, a portion of which is skimmed by the bureaucratic elite to help them maintain their lifestyles – corruption being ignored by the donors, while the majority of the people suffer in silence. Chabal and Daloz (1999) believe that structural adjustment (SAP) saved the patrimonial African state from complete economic ruin by assuring the flow of foreign aid (see Section 11.7, FOREIGN ASSISTANCE IN GENERAL and Chapter 12, Section 12.3.4.3, Structural adjustment and creation of government bourgeoisie). This puts off Sub-Saharan African governments developing viable

economies that serve their citizens, resulting in parallel underground “*survival*” economies, while the vast majority of the subcontinent’s riches are expropriated by the West in collusion with the oligarchy. Little or nothing from Sub-Saharan Africa’s riches are reinvested in the people (health and education) or infrastructure (industry, road networks), while 70-90% of the donors foreign aid money goes right back to where it came from through Western NGOs, consulting firms and their “*experts*”, while Africa drowns in the misery of its wealth (see Section 11.7.1, Foreign Aid as Portion of Donor Country GNP).

By the time many of these countries (e.g., Angola, The Democratic Republic of Congo, Zimbabwe, Liberia, Sierra Leon, etc.) are ready to collapse, it is usually “too little too late” for the West to begin complaining of mismanagement and atrocities, most of which have/were going on for the 20-30 years, but ignored as long as they allied themselves to the West. This has to be explained within the framework of the Cold War, where Sub-Saharan Africa and its emerging countries were staging grounds for the largest game of chess ever played, where Western and Eastern ideologies vied to take over the World; Free-market Economics and Freedom of Speech – Democracy versus Government Controlled Centralized Economies and Repression – Communism.

It has been in the interest of both the West and these despots to keep the masses ignorant; since the odds were that an educated majority would not let these groups take advantage of them, keeping them in extreme levels of poverty on a wealthy continent.

In hind site, it is easy to criticize the West for its shortsighted approach to Sub-Saharan Africa. However, at the time, possible nuclear war and the end of modern civilization precluded long-term visions and approaches to development in Sub-Saharan Africa. However, this does not justify the continuation of these

policies in the post-Cold War era as a means of exploiting Sub-Saharan Africa's incredible resource wealth at the expense of the masses.

11.7 FOREIGN ASSISTANCE IN GENERAL

“Unless development helps the poor and most destitute, it will only increase misery” (Rosenblum & Williamson, 1990).

“Even if it were possible to get enough money for our needs from external sources, is that what we really want?...Gifts which increase, or act as a catalyst to, our own efforts are valuable. But gifts which could have the effect of weakening or distorting our own efforts should not be accepted until we have asked ourselves a number of questions” (Excerpts from Tanzania’s *Arusha Declaration* cautioning about foreign aid In: Sogge, 2002a).

“Many development schemes have been fraught with disaster from the outset...badly conceived, but mostly because the experts supervising the projects have not had adequate background data on the people whose lives they are attempting to influence...the acceptance of aid may be contingent on using the donor country’s nationals as consultants. In addition, aid is too often seen by administrators in the recipient country as a means of financing their bureaucracy with only a small part of the budget going into the field, in the process showing little real concern for the needs that precipitated the donation in the first place. Moreover cultural prejudices and/or political factionalism within the recipient country may result in funds being channeled away from where they are most needed. Perhaps even more damning are attempts to produce results within the budget period so funding can continue” (Smith, 1992).

Success stories are fabricated while the target audience (e.g., farmers and pastoralists) are rarely consulted on the structuring and goals of the project (Smith, 1992).

Aid is a major policy tool used by governments to gain influence.

“The aid resources of bilateral donors, including the United States, tend to follow the donor’s political and strategic priorities, not those of the countries that have the greatest need from a development perspective” (CBO, 1997).

At best it is used to ensure the survival of the victims of famine or civil war (humanitarian aid). At worst, it is used to ensure the survival of unpopular and corrupt governments. However, it is always about survival, never development. Development implies change and self-reliance, whereas aid is habitually directed toward the status quo, usually coming with strings attached (Elwood, 1984). Loans made to African dictators were political bribes for aligning with the West during the Cold War, with little trickling down to the poor (Elwood, 1984; Weinstein, 2002). Foreign assistance became defined by a view of the world as divided into two opposing ideological camps. Bilateral aid favored former colonies and political allies more than open economies or democracies (World Bank, 1998a). The favoring of geopolitical aims over poverty reduction (House of Commons, 2002), often meant arming and propping up undemocratic and repressive governments such as in Zaire, Iran, the Philippines, El Salvador, Indonesia and many other countries, only because they were loyal U.S. allies (Lappé, Collins & Rosset, 1998; World Bank, 1998a) or Soviet aid to Uganda in the Amin era (Elwood, 1984). This was in conflict with the other key objective of foreign aid, the promotion of long-term growth and poverty reduction in developing countries with a major underlying motive of the Western donors being that in the long-term, their economic and political security would benefit if poor countries were growing. Foreign aid has not helped the developing world evolve and, in fact, has resulted in the world becoming a more dangerous place. If there was any altruism in aid, it has long ago disappeared.

Having given up their African heritage in favor of Western education and ideals, intellectuals at independence readily accepted development recipes of the IMF, World Bank and Western donors and their experts premised on the idea that

traditional African economies and social practices should be abandoned and the Western road to modernization closely followed. A few embraced the ideologies of the Soviet Union (Leistner, 2004). Foreign aid became an entrenched, endemic disease in Sub-Saharan Africa.

At best, under current “foreign aid policies”, poverty in Sub-Saharan Africa could be expected to decline only from 72% of the population in 1996 to 64% of the population in 2015, using the \$2 a day poverty line (Collier & Dollar, 2000 *In:* UN, 2001). At worst, with an ever-growing population and scarcer resources that will prevent most Africans from continuing to live traditional lifestyles, poverty could increase exponentially with population growth, maybe even exceed it as resource degradation accelerates.

Aid is supposed to help the poorest of the poor, but doesn't. As currently practiced,

“Foreign aid is a transfer of wealth from the poor in rich countries to the rich in poor countries...” (Guest, 2004).

The poor get poorer, being helped by aid only in times of famine and maybe today with the HIV/AIDS issue. Why is this so? Leistner (2004) argues that during the early years of African independence development assistance was based on the premise that substantial amounts of foreign capital would rapidly enable former colonies to catch up to the Western industrialized world.

Also, while centralized non-representative government has structural roots in colonial rule, it is exacerbated by fear that decentralization will lead to political dissolution and ethnic conflict and thus, support to the continuation of this system being supported by foreign aid to governments. This gave centrally created government agencies power to control and allocate critical resources, including

jobs. The state replaced the market place. In absence of accountable and transparent systems, foreign aid has helped perpetuate a system of political control, privilege and elite predation, patronage, security and corruption, as discussed above (Morris, 1995, Chabal & Daloz, 1999; CBO, 1997; Majewski, 2002; Peron, 2002; Sogge, 2002a; 2002b; Child, *et al.*, 2004a *In:* Child, B., 2004a; Leistner, 2004), in and of the formal economy including the conservation and wildlife sectors. As a result, the political elite have more allegiance to the aid-providing Western donors than to their own people, one of the ways that aid has helped destroy what fragile reciprocity that may have existed between African states and their citizens (Sogge, 2002a; 2002b; Leistner, 2004). Transparency International (2005a) contends that

“although aid can foster better governance, a huge influx of aid money can also prove counterproductive. As foreign aid comes to substitute for taxes, the local population loses a degree of leverage over local authorities, thereby undermining the so-called taxation representation of local authorities”.

Foreign aid tends to rob states and citizens of political power and self-determination resulting in (Sogge, 2002a):

- Fragile, hollow, corrupt, illegitimate institutions de-linked from their citizens.
- Decay or destruction of instruments to steer public policy and mobilize public revenue since the Western donors dictate policy and pay the bills.
- Political accountability upwards and outwards surrendering sovereignty to the Western donors.

Foreign aid can act like oil revenues, driving a wedge between the rulers and ruled (Sogge, 2002a), the donors/NGOs fulfilling government's traditional social obligations so that they may spend their money on more pressing matters.

“...in the developing countries, aid has perpetuated the rule of the incompetent and venal men whose leadership would otherwise be utterly non-viable; it has allowed governments characterized by historic ignorance, avarice, and irresponsibility to thrive; last but not least, it has condoned and in some cases facilitated the most consistent and grievous abuses of human rights that have occurred anywhere in the world since the dark ages. If government officials in the developed world were to stop using taxpayers' money to finance the oppressive activities of state officials in the developing world, if they were to close down the World Bank, the IMF, the United Nations and all the bilateral 'aid' organizations, and if they were to eliminate all barriers to trade, the poor in the developing world would most likely all be a great deal better off” (Morris, 1995).

Zimbabwe's President Robert Mugabe's use of food aid to buy votes in 2002 and 2003 is a prime example.

“Food aid subsidizes war. His (Mugabe's) attack on white farmers disguises that his real target is his black opposition. Now that Mr. Mugabe has destroyed the farms that fed the country and provided export earnings, famine looms. Food aid will enable Mr. Mugabe to nourish his supporters while starving the opposition. The compassionate Western donors will be complicit in an act of genocide” (Roberts, 2003).

These corrupt and tyrannical governments often diverted aid money to military projects used to finance policing techniques that made sure the ruling elite stayed in power and/or to Swiss bank accounts as “retirement” plans for African dictators, in case the policing failed (Peron, 2002). For example, nearly “\$US 2 billion per year over the past two decades has propped up an unpopular government (Egypt), its army and police and helped suppress democracy” (Frankel, 2004).

Economic development is undermined, since rather than developing their countries through stewarding and transforming their natural resources, the political elite live off donor handouts, while mining the continent's resources for short-term gains to their benefit and that of the collaborating Western multi-nationals (see Chapter 13). Meanwhile, as populations exploded in the 20th century, Sub-Saharan Africa failed to evolve out of Stage 1 Agriculture (see Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA). With the land no longer able to support traditional extensive systems of production, while development aid and other Western policies discouraged industrialization, Africans became trapped with one foot in the rural areas (in part-time subsistence agriculture) and one foot in the urban centers (usually slums working in low-skilled labor as "boys" and sending remittances to rural relatives). Neither environment was able to provide a better quality of life. The net result is that the majority of Sub-Saharan Africa's population has become poorer, increasingly malnourished and hopelessly marginalized, with little hope of escaping the downward spiral of poverty. This keeps Africans perpetually in a non-competitive status globally.

Examples of Third World governments using aid to enrich the ruling elite at the expense of the masses include: 1) President Mobutu Sese Seko of Zaire using foreign aid money to partly fund the construction of eleven presidential palaces, 2) Building expensive capital cities, such as Brasilia in Brazil, Islamabad in Pakistan, Abuja in Nigeria, Lilongwe in Malawi, Yamoussoukro in the Ivory Coast and Dodoma in Tanzania, that benefit the ruling classes in some of the poorest parts of Sub-Saharan Africa where government officials are known as "Wabenzi"- a Swahili word for "men of the Mercedes-Benz", and 3) Subsidizing Third World airlines that benefit the elite of the country, while taking away resources from needed private sector activities. Foreign aid has united the governments of the Third World into a cohesive unit that has but one goal: secure more aid. Foreign aid fails as a development policy because it destroys the

incentives of the marketplace, increasing Third World poverty. On the other hand, the alternative policy of free-trade will give the private sector of the LDCs (Least Developed Countries, Less Developed Countries) an opportunity to expand and flourish (Majewski, 2002), only if structured properly and based on transformation of raw products in Sub-Saharan Africa with equality in the openness and availability of markets.

As a result of foreign aid, Sub-Saharan Africa has become a continent of subsistence over the last four decades, to being relegated by the ruling class and imperialism, to a subcontinent whose people subsist on food aid (Zack-Williams, 2002 *In: Zack-Williams, et al., 2002*).

There is also a problem with donor funded projects tending to have a limited life span, resulting in “attempts at development” being undertaken in sporadic efforts without much of a long-term vision, rather like going on a roller coaster ride.

“Lele (1990 *In: Eicher & Staatz, 1990*) explains, “The swinging pendulum of donor’s concerns has tended to divert attention from basic long-run problems. Development strategies in the 1970s tended to concentrate on ‘quick’ poverty alleviations, which gave priority to helping low income regions and populations and to raising food crop production mainly to meet growing urban demand’. The results were mixed. “In the 1980s the emphasis switched to equally ‘quick’ solutions, based on the correction of price incentives and liberalization of markets designed to raise production, particularly for exports” and most recently in food security”.

Finally, most foreign aid “development” projects collapse once donor funding ends because they are not driven by entrepreneurship (e.g., private sector), but by consumptive governments/NGOs/consulting firms, and governments do not have the financial ability to continue subsidizing them (Eicher, 1990 *In: Eicher & Staatz, 1990*). Thus, today, donor-driven development in Sub-Saharan Africa, mostly run by NGOs, tends to run in 2-5 years cycles, after which everything

collapses and one wonders why Sub-Saharan Africa isn't developing. Maybe as President Museveni of Uganda once said,

“ ‘A little neglect would not be so bad. The more orphaned we are the better for Africa. We will have to rely on ourselves’ ” (Gourevitch, 1998).

“Trade is more important than aid. Aid is only important if it is together with trade. Otherwise, aid by itself is useless and even counterproductive”, President Yoweri Museveni of Uganda (2003a; 2003b; 2003c).

11.7.1 Foreign Aid as Portion of Donor Country GNP

11.7.1.1 Overseas Development Assistance (ODA) versus Overseas Assistance (OA)

Foreign assistance is bogged down in bureaucracy and a myriad of definitions that can be a bit confusing.

Overseas Development Assistance (ODA), most often referred to as “foreign aid” (World Bank, 1998), can be defined as “traditional” aid to developing countries on Part I (Developing Countries and Territories) of the Development Assistance Committee (DAC)³⁵⁶ of the Organization for Economic Cooperation and Development (OECD) List. This “official development assistance”, has a long-standing United Nations target of 0.7% of donors’ Gross National Product (GNP) (OECD, 2005). Part I countries are subdivided into (OECD, 2003):

³⁵⁶ Members of the Development Assistance Committee (DAC) of the OECD are Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, the United Kingdom, the United States and the Commission of the European Communities (DAC, 2004).

- Least Developed Countries (LDCs) that includes most of Sub-Saharan Africa, except those listed below.
- Low Income Countries (LICs) with per capita GNI (GNP) of less than US\$ 745 in 2001 that includes Cameroon, Congo Republic (Brazzaville), Ghana, Kenya, Nigeria and Zimbabwe.
- Lower Middle-Income Countries (LMICs) with per capita GNI of US\$ 746-2,975 in 2001 that includes Namibia, South Africa in Sub-Saharan Africa plus from the continent, Algeria, Egypt, Morocco, Swaziland and Tunisia.
- Upper Middle-Income Countries (UMICs) with a per capita GNI of US\$ 2,976-9,205 in 2001 that includes Botswana, Gabon and Mauritius.
- High-Income Countries (HICs) with per capita GNI greater than US\$ 9,206 in 2001.

By the OECD definition, ODA includes:

“Grants or Loans to countries and territories on Part I of the DAC List of Aid Recipients (developing countries) which are: (a) undertaken by the official sector (donor bodies representing OECD countries); (b) with promotion of economic development and welfare as the main objective; (c) at concessional financial terms [if a loan, having a Grant Element (q.v.) of at least 25%]. In addition to financial flows, Technical Co-operation (q.v.) is included in aid. Grants, Loans and credits for military purposes are excluded...Transfer payments to private individuals (e.g. pensions, reparations or insurance payouts) are in general not counted” (DAC, 2005).

In addition to grants, a portion of ODA has a loan component to it that contributes to the buildup of both bi-lateral and multi-lateral debt (see Chapter 12, Table 12.2, The HIPC: Debt and income decline). For instance, in 1997, 55% of Japanese aid was in the form of loans, while 15% of French, German and Italian aid was loans (Jubilee 2000, 2000).

Aid to the "more advanced" Eastern European and developing countries is included in Part II (Countries and Territories in Transition) of the List and is recorded separately as "Official Aid" (OA) (OECD, 2005). This includes (OECD, 2003):

- Central and Eastern European Countries and New Independent States of the former Soviet Union (CEECs/NIS). Some CEECs/NIS counties can be found in various categories in Part I of the List.
- More Advanced Developing Countries and Territories that includes Libya and Israel.

The list of countries falling into each category is reviewed every three years (OECD, 2005). ODA plus Other Official Flows (OOF)³⁵⁷ plus grants and concessional and non-concessional development lending by multilateral financial institutions (World Bank, IMF, African Development Bank/*Banque Africaine de Developpement* (ADB/BAD) are totaled to provide Official Development Finance (ODF)³⁵⁸, as defined by OECD (DAC, 2005). This becomes even more confusing, as the UNDP (2004) definition of Net ODA appears to be OECD's definition of ODF,

“Disbursements of loans made on concessional terms (net of repayments of principal) and grants by official agencies (donors) of the members of the Development Assistance Committee (DAC),

³⁵⁷Other Official Flows (OOF) = “Transactions by the official sector (OECD donors) with countries on the List of Aid Recipients which do not meet the conditions for eligibility as Official Development Assistance or Official Aid, either because they are not primarily aimed at development, or because they have a Grant Element of less than 25%” (DAC, 2005).

³⁵⁸Official Development Finance (ODF) = “Used in measuring the inflow of resources to recipient countries: includes (a) bilateral ODA, (b) grants and concessional and non concessional development lending by multilateral financial institutions (World Bank, IMF, African Development Bank/*Banque Africaine de Developpement* (ADB/BAD), and (c) Other Official Flows for development purposes (including refinancing Loans) which have too low a Grant Element (q.v.) to qualify as ODA” (DAC, 2005).

by multilateral institutions and by non-DAC countries to promote economic development and welfare in countries and territories in part I of the DAC list of aid recipients. It includes loans with a Grant Element of at least 25% (calculated at a rate of discount of 10%)” (UNDP, 2004).

The World Bank (2005) appears to follow the DAC/OECD definition of ODA.

U.S. Foreign Assistance

The United States also appears to follow the more limited OECD definition of ODA as defined by OECD, showing multilateral aid to the African Development Bank/*Banque Africaine de Developpement* (ADB/BAD) as a separate entity (Rice, 2005). ODA falls under a broader category of “Foreign Assistance”. This foreign assistance includes food aid, debt relief, demining, military education and training (Rice, 2005). In Fiscal Year (FY) 2004, U.S. ODA to Sub-Saharan Africa (SSA) amounted to US\$ 467 million, while total foreign assistance to SSA amounted to US\$ 3.4 billion in 2004. Food aid, as a portion of foreign assistance, to SSA amounted to US\$ 1.2 billion in FY 2004 (Rice, 2005).

At US\$ 2.62 billion and US\$ 1.87 billion respectively

“Israel and Egypt continue, as they have since the late 1970s, as the largest recipients (of foreign assistance), although Iraq, receiving over US\$ 20 billion for reconstruction activities since mid-2003, is the biggest recipient in FY 2004”

at US\$ 18.44 billion (Tarnoff & Nowels, 2004). Based on USAID (2005) foreign assistance statistics, US\$ 18,269,100,000 was allocated globally in FY 2004.³⁵⁹

³⁵⁹ Fiscal Year (FY) 2004 runs from October 1, 2003 until September 30, 2004

- Law Enforcement, mainly anti-drug trafficking: US\$ 1,198,200,000
- Military Assistance: US\$ 4,837,700,000
- Humanitarian Assistance:³⁶⁰ US\$ 2,514,700,000
- Multilateral Economic Assistance: US\$ 295,000,000
- Bilateral Economic Assistance:
 - Child Survival, US\$ 1,824,200,000
 - Development Assistance/ODA/Foreign Aid, US\$ 1,376,800,000
 - Global HIV/AIDS US\$ 488,100,000
 - Millennium Challenge Account, US\$ 994,100,000
 - Other. US\$ 4,683,200,000

The USAID (2004) statistics do not show the reconstruction of the Iraq budget of Tarnoff and Nowels (2004), which is separated out in graphs. Based on the Tarnoff and Nowels (2004) statistics, but excluding the Iraq reconstruction budget, 25% of U.S. foreign assistance is going to Israel and Egypt in FY 2004. If one adds the Tarnoff and Nowels (2004) FY 2004 Iraqi reconstruction budget to the USAID (2005) FY 2004 foreign assistance budget, totaling US\$ 36.71 billion, Israel's and Egypt's foreign assistance, totaling US\$ 4.49 billion in FY 2004, make up only 12.2% of total U.S. foreign assistance. By combining them with Iraq, these three countries alone account for 86% of the U.S. foreign assistance budget.

Bandow (2002) concludes that

“U.S. assistance has primarily been political and military, dedicated to buying and subsidizing friends; the large annual flows to Egypt and Israel have nothing to do with economic development”.

³⁶⁰ Humanitarian assistance includes Food for Peace (P.L. 480, Title II) as the largest portion of that line item at US\$ 1,184,900,000.

Under bilateral aid “Development Assistance” is basically ODA, as described by both Tarnoff and Nowels (2004) and USAID (2005). Programs such as Child Survival, global HIV/AIDS and Millennium Challenge Account, might also be considered true aid, although they are almost a form of crisis management to prevent catastrophes. Adding these four programs together, they total about US\$ 4.7 billion and thus, represent only about 26% or 18% respectively depending on whether the exorbitant cost of rebuilding Iraq is included. “Humanitarian Assistance” is primarily for famine/food relief and disaster/refugee assistance and though appreciated, has nothing to do with development. Based on data from Rice (2005), ODA to Sub-Saharan Africa amounts to from 1.3-2.5% of total U.S. foreign assistance in FY 2004. Including ODA, total U.S. foreign assistance to SSA ranges between 13-19% in total foreign assistance in FY 2004, depending on whether reconstruction of Iraq is included.

11.7.1.2 ODA

In 1969, Development Assistance Committee (DAC) of the OECD adopted the concept of "Official Development Assistance", separating ODA from "Other Official Flows" (OOF) and identifying ODA with an official target of 0.7% of GNI/GNP in the form of. By 1970, the United Nations adopted the 0.7% target (Fuhrer, 1996). When the world's governments met at the Earth summit in Rio de Janeiro in 1992, they adopted a program for action under the auspices of the United Nations -- Agenda 21 (see Chapter 9, Section 9.3, COMMUNITY BASED NATURAL RESOURCES MANAGEMENT (CBNRM) PROGRAMS – PART OF THE WAY FORWARD). Amongst other things, this included an Official Development Assistance (ODA) aid target of 0.7% of Gross National Product (GNP) for rich nations - roughly 22 members of the Organization for Economic Cooperation and Development (OECD) formed in 1960 – the club of advanced industrialized countries, known as the Development Assistance Committee

(DAC) (Global Issues, 2002). A decade later, the Monterrey Consensus and the World Summit on Sustainable Development “Earth Summit” of 2002 in Johannesburg all reiterated this pledge of 0.7% of GNI/GNP by OECD countries (Sachs, 2005) (Table 11.5).

Table 11.5: Official Development Assistance (ODA) from 2003 to 2006 at Current prices (2006, US\$ Millions)

Country	ODA in U.S. Dollars (Millions)				ODA as % of GNI (GNP)			
	2003	2004	2005	2006	2003	2004	2005	2006

Table prepared by principal author

The U.S. ranks at the bottom of all donor countries (Booker & Colgan, 2004), U.S. foreign aid (Overseas Development Assistance/ODA) ranging from 0.11-0.15% of its GNP amounting to US\$ 16.254 billion in 2003 or 26% of all ODA, less than or about half the percentage of GNP Germany provides and less than 20% of the percentage GNP provided by the Netherlands (Mule, 2003). Between 2003-2006, the U.S. contributed between 22-26% of all ODA (see Table 11.5). “...much of the money has gone to corrupt, ineffective governments — down a rat hole,” according to Senator Jesse Helms of North Carolina” (Weinstein, 2002).

In 2005, the U.S. contributed US\$ 27.62 billion (0.22% GNP) in foreign aid compared to the next four highest contributors to foreign aid; Japan at US\$ 13.15 billion (0.28% GNP), Britain at US\$ 10.77 (0.47% GNP), Germany at US\$ 10.08 (0.36% GNP) and France at US\$ 10.03 (0.47% GNP) (Hudson Institute, 2007). In 2006, the U.S. spent US\$ 499 billion on its military compared to US\$ 22 billion in ODA. Although this makes the U.S. the biggest foreign aid donor in the world, this amounted to only 0.17% of the U.S. GNP compared to Britain and France at 0.52% and 0.47%, respectively (Munk, 2007).

The U.S. Government has argued that private donations make up a substantial portion of the shortfall in ODA. The total amount of money from nongovernmental development assistance for the United States is about US\$ 3 billion/year. If added to the total U.S. foreign aid, this raises the ODA from 0.15% to 0.18% of the GDP, still well below the 0.7% of the GNI/GNP pledged by Development Assistance Committee (DAC) members of the OECD (Sachs, 2005). In 2005 the Hudson Institute (2007) estimated total American “economic engagement” with the developing world as 1) private giving³⁶¹ globally at US\$

³⁶¹Includes foundations, corporations, private and voluntary organizations, universities and colleges, religious organizations and individual remittances (Hudson Institute, 2007). Unclear to the authors as to whether ODA channeled through many of these NGOs was factored out?

95.2 billion (50% of total – 3.5x ODA), private lending and investment at US\$ 69.2 billion (36% of total) and ODA of US\$ 27.62 billion (14% of total), totaling US\$ 192 billion and amounting to 0.98% of the U.S. GNP. Of the U.S. private giving, remittances by migrants to their families in countries of origin comprised the largest component amounting to US\$ 61 billion in 2005 (Hudson Institute, 2007).

Aid levels in 1999 were US\$ 10.8 billion compared to US\$ 17.9 billion in 1992, when development assistance to Sub-Saharan Africa reached its highest levels ever (Luna, Cox & Slengesol, 2001). Between 1996 and 2001, OECD statistics indicate that net ODA for Sub-Saharan Africa³⁶² ranged from a high of US\$ 15 billion in 1996 to a low of US\$ 12.2 billion in 2000 (Table 11.6) (see Chapter 12, Section 12.5, DEBT AND STRUCTURAL ADJUSTMENT POLICIES).³⁶³ Other estimates are that total ODA (Overseas Development Assistance) to Sub-Saharan Africa from all countries has declined from US\$ 19 billion (Guest, 2004)/US\$ 20 billion (Croal, 2002) in 1990. Net ODA to Sub-Saharan Africa was US\$ 17.2 billion in 2003, US\$ 16.7 billion in 2004 and US\$ 22.5 billion in 2005 (US\$ 19.2 billion, US\$ 19.3 billion & US\$ 24.7 billion, respectively for all of Africa), in 2007 prices (OECD, 2007).

This amounts to ODA declining from US\$ 32/person in 1980 to US\$ 22/person in 2001 in Sub-Saharan Africa (Sachs, 2005). Luna, Cox & Slengesol (2001) estimate Aid/ODA to SSA fell from US\$ 32 per head in 1990 to US\$ 19 by 1998. The Commission for Africa (2005) estimates that foreign aid/ODA averaged only US\$ 25-30/person/year in Sub Saharan Africa compared to US\$ 9-10 per capita/year in FDI and US\$ 4-5 per capita/year in remittances.

³⁶² Sub-Saharan Africa = Africa minus Egypt, Tunisia, Algeria, Morocco and Libya.

³⁶³ Note. In 2002 ODA was US\$ 17.2 billion dollars (see Chapter 11, Section 11.6.7, Foreign Aid and Puppet Governments – “Donor Democracy”, Table 11.4: Official 2002 development assistance (ODA = foreign aid) as a percentage of all investment inflows to Sub-Saharan Africa)

In 1995, the director of the U.S. Agency For International Development (USAID) defended his agency by testifying to Congress that 84 cents (84% of all foreign aid from the USA) of every dollar of aid goes back into the U.S. economy in goods and services purchased. For every dollar the United States puts into the World Bank, an estimated US\$ 2 actually goes into the U.S. economy in goods and services (Aristide, 2000 *In: Global Issues*, 2002). Similarly, Sankore (2005) estimates that for every dollar of AID to Sub-Saharan Africa, Western economic interests take out a minimum of US\$ 2. In 1995, severely indebted low-income countries paid one billion dollars more in debt and interest to the International Monetary Fund (IMF) than they received from it. For the 46 countries of Sub-Saharan Africa, foreign debt service, mostly from bilateral and multilateral foreign aid loans, was four times their combined governmental health and education budgets in 1996. So, we find that aid does not aid (Aristide, 2000 *In: Global Issues*, 2002) (see Section 11.7.4, Foreign Aid and Debt and Chapter 12, Section 12.5, DEBT AND STRUCTURAL ADJUSTMENT POLICIES).

Sources: OECD (2002), Geographical Distribution on Financial Flows to AID Recipients

Despite US\$ 1 trillion in loans since the 1960s, the per-capita growth rate of the typical developing country over the past 20 years was zero (Weinstein, 2002). On

the average, one year of foreign aid/ODA to Sub-Saharan Africa is the equivalent or more to the US\$ 12 billion Marshall Plan³⁶⁴ that rebuilt Europe after World War II, but with little to show for all of this spending. Rosenblum and Williamson (1987) estimated that total foreign aid/ODA to SSA was about US\$ 9 billion/year, the Western donors spending US\$ 116 billion between 1960 and 1986 in Sub-Saharan Africa, the equivalent of 9.7 Marshall Plans; Guest (2004) estimating the equivalent of six Marshall Plans. Sogge (2002a) estimated foreign aid/ODA at US\$ 16 billion in 1998, more than enough to help the continent begin developing, except the money is not put where the rhetoric is and in fact, is really not meant for development.

Unless used properly, a decline in ODA may be the best thing that ever happened to the subcontinent, forcing the richest continent in the world to start developing based on transforming its natural resources in Africa. In addition, although Sub-Saharan Africa has received 60% of increases in overall ODA disbursements over the five year period between 1998 and 2003, most of these funds have been allocated to post-conflict situations, leaving little for development aid (GDF, 2005).

The July, 2005 G-8 summit in Gleneagles, Scotland, pledged an additional US\$ 25 billion/year in ODA to Africa by 2010, a total of US\$ 50 billion/year to all developing countries (DeCapua, 2005a). Though it is unclear, given that the most impoverished nations are on the subcontinent, it must be assumed the majority of this increase will go to SSA. If this aid is spent on basic needs in Africa and issues such as education and health, as opposed to technical assistance (experts and consultants where the revenue flows back to the donor country), it may be of

³⁶⁴ Marshall Plan from 1948-1951 cost about US\$ 12 billion to rebuild Europe after WWII,

some value. How important is this increase in ODA versus needs? “Even if the Millennium Development Goals (see Chapter 13, Section 13.12.5, Poor Track Record in Achieving United Nations “Millennium Declaration” Goals) are reached in 2015, more than 1 in 5 people in Sub-Saharan Africa (20% of the population) will still be living in extreme poverty” (Greenhill & Watt, 2005) unless development goes beyond ODA. If ODA remains the primary form of foreign investment in Sub-Saharan Africa, it is likely that the majority of the population will continue living subsistence lifestyles, while governments will remain in a perpetual state of welfare, neither of which is sustainable and that typifies the subcontinent in 2005.

11.7.2 Foreign Assistance Conditionalities Good Business for Donor County Not Recipient/Host Country

“Africa, once the province of district officers and missionaries, was suddenly a hothouse of every amateur development theorist, social engineer, tank salesman, unemployed mercenary, rogue industrialist and purveyor of unwanted pesticides. Some misguided projects were designed with the best of intentions; others were outright fraud. Often African leaders were less interested in a project’s effect on their people than in the size of the kickback” (Rosenblum & Williamson, 1987).

In the 1980s, a backlash by the U.S. government to corruption in government-to-government foreign aid/assistance resulted in aid being funneled through U.S.-based NGOs and consulting firms. Even allowing for corruption, their high overheads and salaries soaked up much of the aid, costing more than running money through host country ministries, and took away a sense of ownership and a long-term fostering of self-sufficiency by these countries. In turn, these U.S.-based aid contractors lobbied Congress to protect their programs with budget earmarks, regardless of whether these programs were priorities for host countries. This resulted in low flexibility of aid/assistance to meet development needs. In the 1990s, under the William (Bill) Jefferson Clinton administration, foreign

assistance cash was “smuggled” into other parts of the federal budget, being split among more than a dozen accounts, often duplicating efforts and being at cross-purposes. Foreign aid became politicized, serving special-interest lobbying over the interests of developing countries (Washington Post, 2006).

Foreign assistance is big business for donor country consulting firms, in the U.S. called “Beltway Bandits”, large numbers being situated around the 495 Beltway that encircles the center of power and wealth, Washington, D.C., as well as for Non-Governmental Organizations (NGOs). There are simply too many people trying to get their hands on the aid dollar. As long as aid has to serve the interests of foreign businessmen, aid bureaucrats and African governments the poor will see very little of it (Elwood, 1984).

“ ‘Aid is the way in which the Western world is helping lift Africa out of the poverty’- a comforting myth propounded by politicians and aid bureaucrats that we are ‘doing our bit’ for Africa’s poor. But aid has become a business - a big business - and it has a lot of goals other than helping the poor” (Elwood, 1984).

“In that notorious club of parasites and hangers-on made up of the United Nations, the World Bank, and the bilateral agencies, it is aid and nothing else that has permitted hundreds of thousands of ‘jobs for the boys’ and that has permitted record breaking standards to be set in self-serving behavior, arrogance, paternalism, moral cowardice, and mendacity” (Morris, 1995).

Most of foreign assistance grants/loans come with “conditionalities”, requiring that a large percentage of goods and services be purchased from the donor country including:

- Employment of “Expatriate Experts” from the donor country.
- Most project materials and supplies must be bought in from the country of the donor.

The Commission for Africa (2005) calls this “tied aid”, in which developing countries are required to buy the goods and services from the Western donor

country. They estimate a reduction in value of 30%, which appears too low compared to the above figures and recommend that it should be scrapped. In other words, the majority of aid needs to stay in the developing country and be spent on development (e.g., developing health and education, infrastructure and capabilities). The net results are that (CBO, 1997):

- “The aid may be given with the best interests of the donor in mind, not those of the recipient country.
- The subsidy involved in concessional aid may benefit the exporter rather than the recipient.
- Linkages between the development projects and the local economies are not formed. Thus, the local economy derives little long-term benefit from the projects”.

In the USAID funded programs in which the principal author worked, about 90% of the bilateral foreign aid/ODA money returned to the country of origin. Others estimate from 70% (Global Issues, 2002) to 84% of every dollar from U.S. foreign aid goes back into the U.S. economy in the purchase of U.S. goods and services (Aristide, 2000 *In: Global Issues*, 2002). Jeffery Sachs (2005) estimates that in 2002, of the ODA reaching developing countries (some went to middle-income countries, debt relief grants and repaying loans to rich countries), only around US\$ 15 billion or 31% of the US\$ 48 billion went to basic needs (e.g., health, education, clean water). Of the US\$ 30/Sub-Saharan African in ODA in 2002 from all countries, US\$ 5 or 17% went to consultants from donor countries, US\$ 3 or 10% for food aid (e.g., subsidizing American and European farmers) and other emergency aid, US\$ 4 or 13% to service Sub-Saharan Africa’s debts, US\$ 5 or 17% for debt relief operations and the remaining US\$ 12 or 40% supposedly to on-the-ground programs (Sachs, 2005),³⁶⁵ though much of this was likely consumed by government bureaucracies and NGOs, with little reaching the poorest of the poor. Thus, a minimum of 60%, but likely more, went back to the

³⁶⁵ Sachs’ (2005) breakdown is minus US\$ 1/person that is US\$ 29/person as opposed to US\$ 30/person.

Western donor countries from the purchase of goods and services, as well as for debt servicing/relief by the recipient countries in Sub-Saharan Africa. Jeffrey Sachs (2005) estimates in 2002 that the United States contributed US\$ 3/Sub-Saharan African, globally spending about US\$ 15 billion on ODA in 2004 (US\$ 19.7 billion indicated in Table 11.5), while spending US\$ 450 billion in military aid.

“After taking out parts for U.S. consultants, food and other emergency aid, administrative costs, and debt relief, the aid per African came to a grand total of 6 cents” (Sachs, 2005) or 2% of foreign aid, the remainder or 98% returning to the U.S.

While working as an “expert” for a private sector “Beltway Bandit” contracted to USAID, this included among others:

- Salaries of Expatriate Experts which were about seven times higher or more than their host country counterparts;
- Importation of Duty-Free Household Goods and Vehicle;
- Free housing (better than most could afford in their own country, gardeners and security guards to protect them from the “have-nots” who they have come to help);
- Placement of children in the best private schools of choice anywhere in the world.
- Vacation trips for children to visit parents;
- Once a year, trip to the home country for the expert, spouse and children living with them;
- Exclusive use of the U.S. Embassy Commissary where one could buy American products as opposed to locally produced ones;
- *Per diem* for all field trips, which covered fuel, lodging and meals;
- Exemption from paying both host country and donor country taxes;

- An overhead for the “Beltway Bandit” consulting firm who was awarded the contract. Usually the overhead, which had to be justified by an audit, was 1-1.5 times the cost of the basic proposal. This helps pay the cost of the headquarters building and all support staff salaries, plus trips for the “home office” to visit the overseas project site once to twice a year to see how their project staff are doing – which is often judged at a political level (e.g., getting along with counterparts, going along with the political agenda of the donor country and host country, regardless of the consequences of the project on the environment or the people), as opposed to a technical performance level; and
- “Learn to Love America” trips for carefully selected host country counterparts, which the donor wishes to influence ideologically.

Thus, expatriate experts spend little of their salaries or donor project money in the host country, contributing very little to the host country economy, but very much so to that of the donor country. The biggest economic benefit is likely the rental of houses in the host country (country receiving aid) owned by the elite. In the late 1980s, it is estimated that there were 80,000 expatriate “experts” in Africa, costing US\$ 8 billion/year, while African university graduates were unemployed (Rosenblum & Williamson, 1987; 1990). NGOs, because they are not-for-profit, will pay slightly lower salaries and benefits, but will operate in a similar manner.

At the end of most projects, which last between three and five years on average, the host country is left with a fleet of run-down vehicles and paper reports. When the project ends, this so-called “development” remains dependent on outside funding from the world’s taxpayers or it comes to a halt. There is no sustainability since this would have depended on the private sector, host country or foreign, generating wealth from sustainably extracting, transforming and marketing the resources of the host country. In the 1970s, through to the 1990s,

the private sector was not part of the foreign aid plan even though many donors had private sector sections within their agencies. What the donors called the private sector had more to do with small farmers and micro-enterprises that are certainly important. However, it rarely dealt with helping FDI and joint ventures between foreign and local entrepreneurs to establish factories that could transform raw products, develop commercial agriculture to feed the urban masses and create a middleclass (see Chapter 5, Section 5.7.6, Weakness of Entrepreneurship and The Private Sector, Constraint to Food Production).

Madsen (1999) provides an excellent example of this foreign aid industry,

“The Rwandan people remain traumatized by the events of 1994. The country is kept alive by a combination of official and NGO assistance programs. In fact Kigali’s only functioning industry appears to revolve around the government bureaucracy and the international aid organizations...Rwanda is almost totally subservient to the indefinite provision of aid from the rest of the world as well as dictates from the Pentagon and Uganda’s Museveni”.

The “assistance industry” is lucrative; the newly arriving NGOs following the 1994 genocide being called the “New Klondikers” participating in a gold rush. In Goma (the Democratic Republic of Congo) alone, there were about 100 NGOs (see Chapter 13, 13.8.6, Former Cold War allies vying for power in the Great Lakes Region).

Speaking of so-called experts and foreign interventions into five year plans in the Central African Republic, O’Toole (1986 *In:* Giles-Vernick, 2002) states:

“ ‘...French and other foreign advisors, continued to seek economic development through a centrally controlled productionist approach without any attempt to consult with agriculturists (small farmers) who are the basic producers in this overwhelmingly agricultural economy. The only benefactors of this persistence in the face of failure are the planners themselves and those who supply the spate of imported goods and technical assistance with which each new centrally planned project is launched’ ” (see Chapter 7, Section 7.8.3, Environmental Impact Assessment (EIA) Industry – No Hippocratic Oath).

Sachs (2005) implies the need for conceptual application of the medical “Hippocratic type oath” of ethical responsibilities in the foreign assistance and development fields/industries. This implies that donors, consulting firms, NGOs and government bureaucrats/politicians should be held responsible for their actions with regards to human rights and welfare of the people they are supposed to be helping. As a technical advisor to the Gambia River Basin Authority (OMVG) in the 1980s, when the principal author and his counterpart asked to take planned development alternatives into the rural areas and small towns to solicit input from farmers and other stakeholders, they were told by the chief technical advisor, Mamour Gaye, that that was not how planning was to take place. First, the OMVG bureaucrats and host country politicians would determine the appropriate road to development that circled around farming. Then we would go into the field to explain to basin residents what we were going to do for them, which if the politicians had had their way would have been catastrophic for both the people and environment due to the politicization of inappropriate dam sites (see Chapter 7, Section 7.8.5, Politics of Proposed Dams on The Gambia River). These top-down Western donor funded projects have, and continue, to wreck havoc on the lives of the poor across Sub-Saharan Africa, with the main beneficiaries being technical assistants/NGOs, consulting firms, construction companies and donor/host country bureaucrats. After about 40 years of foreign aid, most Africans are poorer and have lower standards of living than at

independence and economies are worse off, not better off, as a result of Western donor interventions.

In the USA, a separate agency, Overseas Private Investment Corporation (OPIC)³⁶⁶, is the major donor agency, which is supposed to deal with the private sector, providing low interest loans in high-risk developing countries. While there must be some benefits to Africa from this process, in all the years the principal author has been in Africa (1977-2006), not one such investment has been personally observed. In 2002, for the first time, he ran into OPIC linked to a government office encouraging private investment in Uganda and low cost insurance on that investment.

The principal author's impression is that, many of the donor bureaucrats, "Beltway Bandits" and NGOs were and are afraid of the private sector. If the private sector in Sub-Saharan Africa worked and the economies of the subcontinent, as they should be, were driven by the private sector, there would be no need for foreign aid and the large "development industry" which has grown-up around foreign aid. The private sector, especially the international private sector, has been no angel in Africa and while it is believed they are the way forward for the future of Sub-Saharan Africa, they also have long strides to make to assure their constructive role in the future of the African subcontinent (see Chapter 13). Their role must greatly evolve along with transparency, accountability and responsibility for their actions, though this is true for all stakeholders, including African governments. Meanwhile, the local private sector, hunters, farmers, pastoralists, fishermen, honey collectors, etc., are often compromised and constrained by foreign aid funded conservation and development programs which cut them off from accessing their resources (see Chapter 9, Section 9.7.2.1, Devolution Through Policy Reform, Land and Resource Tenure; Section 9.7.6.3,

³⁶⁶ 1100 New York Avenue, NW, Washington, D.C. 20527, Tel: 202-336-8400, www.opic.gov

Accountability, transparency and the creation of capitalist structures within communal systems and Section 11.11, CASE STUDIES, USE OF FOREIGN AID TO IMPOSE WESTERN PRESERVATION PHILOSOPHIES ON RURAL AFRICANS).

On the positive side, one of the best things the donors have done is to send host country nationals, mostly bureaucrats, off to their countries for university degrees. However, the cost of such an education can be four to five times higher than educating them on the African continent, even in South Africa where the university (tertiary) education is “First World” in quality and more relevant with Western economic, business and conservation concepts adapted to the subcontinent. Though exact figures are not available, it is estimated, other than for workshops and short-courses, long-term (e.g., two years or more) training of Africans from foreign aid is less than 1% of the total aid budget, where it should be minimally 10-20% if significant gains are to be seen in creating a critical mass of educated Africans able to influence change on the continent.

“A 1997 newsletter of the U.S. Agency for International Development (USAID), the government agency in charge of U.S. foreign assistance, put it this way: ‘The principal beneficiary of America’s foreign assistance has always been the United States. . . . Foreign assistance programs have helped the United States by creating major markets for agricultural goods, new markets for industrial exports and hundreds of thousands of jobs for Americans.’ The same report argued forcefully that the amount of money spent on aid be upped significantly in order to maintain U.S. ‘leadership in the global arena’ ” (Lappé, *et al.*, 1998).

Leadership could mean using foreign aid to buy votes and influence at forums such as the United Nations, influencing national policies, helping multi-nationals obtain lucrative resource extraction contracts, or educating a host country national

in Western ideologies at Western universities. This use of foreign aid exemplifies Western aid in general.

11.7.2.1 CARE, caring for whom?

Helping people is hurting people. People want to believe that Save The Children saves the children, that CARE cares, that Feed The Children is feeding children. CARE, Catholic Relief Services (CRS), World Vision and Save the Children are government contractors more than charities. The more they believe, the more money these NGOs get. The aid money keeps coming in because the U.S. government has political and strategic interests. In Somalia, it was all about a military base in northern Somalia and so the U.S. was not going to tell Siad Barre, the dictator, that he could not have his food aid. Therefore, all this aid money from the U.S. Government was subcontracted to NGOs, largely CARE. What became obvious, however, was that they were delivering to refugee camps that should not have existed (Might Magazine, 2002; Sogge, 2002a). All along the way, governments, local leaders and militias took their cut of the food aid. Somebody always gets rich off a famine (Might Magazine, 2002) (see Section 11.8.7, Food Aid and War in Somalia). The principal author saw donated rice, during the drought of the 1970s/80s, diverted and being trucked for sale in the Casamance, Senegal; a rice-growing region with little need for more rice.

In order to do humanitarian aid work in Somalia, Kenya, Liberia or Rwanda, you inevitably have to help one side in a civil war against the other. If there isn't a war situation, food aid supports the status quo, the government in power. They are the ones who are choking off farmers and not allowing them to sell grains or coffee etc. to the highest bidder (Might Magazine, 2002).

“Ads give the impression that all these Africans are a bunch of infants who will starve to death if a bunch of 25-year old volunteers aren’t sent over there to take care of them. The whole aid industry is built on this conceit that Americans (and other nationalities) can go into an African village and, by virtue of some innate quality of American-ness, have something to offer people, something that you can teach people there...‘Do you really think people can’t take care of themselves? Where do people get the idea that Africans are gonna really suffer if a bunch of American volunteers go home? It’s an absurd notion” (Might Magazine, 2002).

“Aid is about people here getting their hands on government money. Seventy (70%) to 84%, if not more of all aid money stays in the U.S. It goes to salaries, to U.S. corporations; that's what it's about...The list of private companies making money is huge...We don't look at CARE in that way. We're not willing to say, CARE is making money from this as well. In fact, they are. They're paying their salaries, they're expanding, they're hiring new people, making capital investments - they're just not paying taxes on it” (Might Magazine, 2002) as a not-for-profit NGO.

Let us keep that food aid and other forms of foreign assistance coming so we can justify our NGO existence, whether the people need it or not.

11.7.3 USA/Western Foreign Policy - Strategic Africa

The modern concept of foreign assistance emanated from the Marshall Plan after World War II to help rebuild Germany and Japan. Eventually, foreign assistance became a political tool to buy allegiance from developing countries against the Russians, Chinese and Cubans during the protracted Cold War of the 1960s, 70s, 80s and early 90s.

Today foreign assistance appears to be over buying political favors to extract Africa petroleum, other minerals, timber resources, wildlife and raw agricultural

products as cheaply as possible by Western Multi-Nationals with backing by their governments.

“US interest in Africa is growing steadily. The ‘trade not aid’ policy and Clinton’s ‘Treaty for African Opportunity’ are being revamped by the Bush administration along the lines of oil and security. Military supplies, training, and advisors have increased, while aid has been reduced. Now what counts is the map of oil fields and the location of the main minerals that are strategic for the USA. The new approach is more pragmatic and to the point, consisting essentially in assuring that the USA will benefit from the most favorable conditions for exploitation, with the direct support of the military apparatus” (Jampaglia, 2002) (see Chapter 13, Section 13.8, FRANCE/US ANGLOPHONE COMPETITION FOR INFLUENCE AND RESOURCES IN AFRICA – NEW SCRAMBLE FOR AFRICA).

Regardless of whether it is bi-lateral aid or multi-lateral aid such as the World Bank and International Monetary Fund (IMF), Western donor interventions in Sub-Saharan Africa have been, and are, short-term and exploitative.

“One of the root causes of poverty lies in the powerful nations that have formulated most of the trade and aid policies today, which are more to do with maintaining dependencies on industrialized nations, providing sources of cheap labor and cheaper goods for populations back home and increasing personal wealth, and maintaining power over others in various ways” (Global Issues, 2002) (see Chapter 12, SUBSIDIES, FREE-TRADE, STRUCTURAL ADJUSTMENT AND DEBT RELIEF IN AFRICA, IMPACTS ON RESOURCE EXPLOITATION).

A study for the U.S. Congress (CBO, 1997) raised the issue that economic growth from foreign aid in developing countries may not be in the best interest of the U.S. Government,

“even if U.S. foreign aid does the job of promoting economic growth overseas, it will have adverse consequences for the United

States. Economic growth among developing countries means that they have become competitors in the global market. Cheaper wages in developing countries allow foreign competitors to charge prices that are lower than those for comparable U.S. goods in world and domestic markets, critics would claim, thus causing the United States to lose jobs”.

It goes on to say that using foreign aid to help the poorest of the poor, though laudable, is impractical and ineffective and would be best spent on countries and policies that directly support U.S. national interests.

11.7.3.1 FIDES and Aid Welfare

As a means of stemming a desire for self-rule in Francophone Africa, the Brazzaville Conference of 1944 determined that supplying the colonies with “equipment” and bestowing on them the honor of “Overseas France” would “obviate all possibility of autonomy or of evolution outside the French Empire”. The outgrowth of this was a beginning of foreign assistance in Africa known as the *Fonds d'Investissements pour le Développement Economique et Social* (FIDES). Until 1966, FIDES and later *Fonds d'Aide et de Cooperation* (FAC), which replaced FIDES, granted money only for research, agricultural production and “infrastructure of society”. The absence of any department for industry was very revealing, as the kind of aid provided by the French could only prolong the ‘raw material’ economy of Africa (Dumont, 1966). René Dumont (1966) recommended to the FAC directors in 1961, the reduction of aid in propping up tottering budgets and expenses for infrastructure (which should be covered internally by a country’s economy) in favor of grants for agricultural units, vocational training and, above all, industrialization as a means of developing African economies that could pay for education, health care and infrastructure, as well as derive taxes to cover government budgets. His recommendations fell on deaf ears. René René Dumont (1966) concluded that the

“FIDES precedent of the ‘political gift’ continues to inhibit development in Africa. The peasant is accustomed to receiving everything free, and is encouraged in this attitude by the spectacle of innumerable privileged civil servants. It is hard to persuade him to make the great efforts necessary for agricultural development. His leaders have chosen the easy way out, preferring to make liberal promises, rather than get down to work”.

In essence, France and the West in general, with foreign assistance, have developed “welfare states” living off international handouts with similar consequences to those of welfare in America’s inner cities and Indian reservations; the break-up of traditional values and societies, the loss of self-esteem, pride and dignity, and escape from all of this through drugs and/or alcohol. Aid was not meant for development, but continued dependency on and exploitation by the former “Mother country”, in this case France. You can be assured that the approach of the other colonial powers (e.g., Great Britain, Spain, Portugal and Belgium) towards foreign assistance, and eventually the USA, was, and is, no different today in 2008.

11.7.3.2 Eco-welfare Uganda, 2002

The Uganda Game Department (UGD) was created in 1926 to manage game reserves, while Uganda National Parks was established in 1952 with the creation of Murchison Falls National and Queen Elizabeth National Parks (Child, *et al.*, 2004a *In:* Child, B., 2004a).

Wildlife in Uganda has been reduced by 95% as a result of civil wars in the 1970s and 1980s (1972-1985), along with continued human population growth. However, during this period, park habitat remained largely intact and unencroached (Child, *et al.*, 2004a *In:* Child, B., 2004a), though heavily poached.

In the long run, lack of benefits to an ever-increasing human population risks, as in Kenya, pushing people to opt for other land uses; encroachment by agriculture and livestock in parks and game reserves being a bigger threat than poaching. Uganda's game reserves have always been the poor second cousin to the national parks system. Since 1996, park and reserve management have been consolidated under one, the Uganda Wildlife Authority (UWA) (Child, *et al.*, 2004a *In:* Child, B., 2004a).

In 1978, all game utilization was banned in Uganda (Averbeck, 2001). Child, *et al.* (2004a *In:* Child, B., 2004a) place the ban on hunting as 1985. However, by 1996, Uganda adopted a new Wildlife Statute. The statute vests ownership of wildlife with the state but makes provision for people to own any wildlife that has been lawfully taken. Part VI of the statute provides for different categories of "user rights", like hunting, farming, ranching, general extraction and trading with wildlife products. This was intended to motivate communities and individual landowners to conserve wildlife through sustained use (Averbeck, 2001).

The official statistics are that 70% of the Uganda Wildlife Authority's (UWA) budget comes from Western donor handouts (Kaye, *pers. comm.*), implying that the current tourism industry is not generating enough money for the UWA to stand on its own. It is said that in the 1960s Murchison Falls alone had over 60,000 visitors/year (Speidel, *pers. comm.*), while Child, *et al.* (2004a *In:* Child, B., 2004a) estimate 3,000 tourists/week to Murchison Falls during this time frame. Due to unrest along its borders, where most of the parks are found, it is said today (2001) that only 5,000 tourists come to Uganda/year (Speidel, *pers. comm.*), Child, *et al.* (2004a *In:* Child, B., 2004a) estimating 3,000-5,000/year by the mid-1990s. Given these facts, it is likely that over 90% of the UWA's income comes from donor handouts in a welfare relationship.

For instance, Murchison Falls Park only covers 51% of its expenses, the remainder being covered by Western donors. This is believed to be typical of most of Uganda's parks. There is so little money going from the parks to peripheral communities, who are supposed to share in 20% of the gate fees that Western donors are taking up this obligation. Yet GTZ³⁶⁷ has spent US\$ 25 million over ten years in Murchison Falls Park, with little to show for sustainability. It is said that the major source of income is from car ferry fees, while connected Indian businessmen who control the lodges, pay little or nothing back to UWA (Speidel, *pers. comm.*). This is both welfare and not sustainable. Some of this is due to a bureaucratic failure, but most of it is due to the fact that the tourists are not there. The World Bank and Global Environment Facility (GEF) approved US\$ 28 million for the UWA in 2002 (Child, *et al.*, 2004a *In:* Child, 2004a). How is it to pay back this and other loans?

The potential for ecotourism in Uganda is incredible, maybe better than anywhere else in Africa, especially in Western Uganda with Bwindi (gorilla viewing and afromontane forests), Queen Elizabeth (unique plains game of the Nile Basin and elephant), the Rwenzoris/Mountains of the Moons (Bakonjo culture, unique vegetation and snow capped mountains), the Semliki Valley (Pygmies and tropical lowland forests) and Murchison Falls (plains game and waterfalls); one of the most ecologically diverse environments anywhere in the world over such a short distance.

Civil wars and current political turmoil along the borders, with loss of lives of national and international tourists, has brought Uganda's ecotourism to a halt. However, civil wars in Zimbabwe and Mozambique never stopped the hunters from coming. If opened, hunters will come to Uganda tomorrow, as proven during

³⁶⁷ Deutsche Gesellschaft für Technische Zusammenarbeit (German Technical Collaboration), German Donor Agency

the Zimbabwe and Mozambique civil wars. Hunting is low volume, high paying tourism and does not need many clients to generate wealth from wildlife. Africa's relying purely on eco-tourism to protect wildlife and generate wealth is extremely dangerous given the current unstable political environment over most of the continent, which scares off eco-tourists (Child, 1995). The killing of tourists in the gorilla watching area of Bwindi Impenetrable Forest by Rwandan guerrillas, security problems by a secessionist movement in the Rwenzori/Mountains of the Moon and the machine gunning of Ugandan tourists in Murchison Falls, virtually halted tourism (Child, *et al.*, 2004a *In:* Child, B., 2004a).

Meanwhile, what little money is available from the donors is pushed into the parks. Ugandan parks' poor second cousin, the game reserves, generate little or no income and are being poached and invaded by livestock, honey collectors, small farmers, etc. – a wave of human poverty. In many cases, they are paper tigers that exist only on maps, but which in the field are barely functional due to a lack of resources.

There is a nucleus of wildlife in game reserves from which Uganda could generate immediate income, while protecting these populations to allow them to grow in numbers and generate even more income. Initially, Lamprey, Buhanga and Omoding (2003) estimate that trophy hunting in Uganda could support 1-2 safari operators, especially in game reserves such as, "Bugungu Wildlife Reserve (WR), Karuma WR and East Madi WR. Others with potential, but unlikely to be included due to their importance to UWA for game-viewing tourism, are Kigezi WR, Kyambura WR and Toro-Semliki WR".

In 2002, the principal author was involved in presenting a proposal to the UWA. This proposal estimated that with about four game reserves, it could initially

generate US\$ 220,000/year for the UWA. In addition to money for UWA, it was recommended that 25% of the US\$ 220,000 (about US\$ 55,000) should go to communities, along with another US\$ 27,000 that the safari company would raise for community development. The company would also employ 50 full time and 50 part time staff in hunting. This income generation is based only on hunting of very conservative quotas and does not include income and employment from sport fishing and ecotourism, which the company planned to develop. At the time, these game reserves were sitting idle with little or no infrastructure (see Chapter 9, Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders).

The company planned an integrated approach which would include wildlife monitoring based on adaptive management principles in collaboration with UWA, the Makerere University Institute of Environment and Natural Resources (MUIENR) and community employment – including employment of reformed poachers, training and development, tertiary training in nature conservation, some access to natural resources through development of a land use plan, increased access through road building and maintenance, permanent camps and a year round presence in the area for the purposes of anti-poaching.

Although his partner struggled with this idea, the principal author also wanted, within five years, for the community to run and operate the hunting camps. In essence, the camps would belong to them and the safari operator would set the standards and bring in the clients.

Game reserves serve as buffers to parks. By allowing the private sector to co-manage the game reserves with UWA and local communities, biodiversity would improve in both game reserves and parks as game populations improve and habitat recovers from uncontrolled exploitation. This project was never approved.

Although there is a pilot hunting program around Lake Mburo on private ranches, the income it can generate is minor, plus it is questionable whether in the long run wildlife in this area will be able to compete with agriculture as a land use [see Section, 11.11.2, Donor Driven Conservation, Lake Mburo National Park (LMNP), Uganda].

The welfare relationship which UWA has developed, in living off handouts from Western donors and animal rights groups such as International Fund for Animal Welfare (IFAW)³⁶⁸ (Thomson, *pers. comm.*), is not sustainable. As discussed, donor funding runs in 2-5 year cycles. Historically, donor fatigue will set in and funding will disappear. Donor welfare seems to be hampering UWA's ability to make sound economic decisions. There is no doubt that the Western donors have been infiltrated by animal rights groups and that they reflect the Western urban bias of preserving wildlife, in favor of using wildlife as an economic resource (conservation). Both Kenya and Uganda are known to harbor such groups and their conservation (or better put - preservation) policies and politics are heavily influenced by them. According to Thomson (*pers. comm.*), the Director of UWA, Dr. Arthur R. Mugisha, was sent off for advanced university training by International Fund for Animal Welfare (IFAW), a known animal rights group that also heavily influences Kenya's conservation politics (see Section 11.11.9, Kenya Wildlife Service (KWS) – Living on Donor Handouts, Negative Impact on Kenya's Wildlife Outside Parks).

In conclusion, Ugandan conservationists must ask themselves why cattle, goats and sheep are thriving, while wildlife and wildlife habitat is shrinking. Given current government policies, rural communities are making sound economic decisions. It is economics reaching down to the level of impoverished rural communities, not foreign welfare, which will save Uganda's wildlife and provide

³⁶⁸ International Fund for Animal Welfare (IFAW), PO Box 193 • 411 Main Street Yarmouth Port, MA, 02675, USA. <http://www.ifaw.org/ifaw/general/default.aspx>.

some of its people with a future. Ultimately, as discussed in Chapter nine, it would be best for community-owned Ugandan hunting and tourism companies to operate, as opposed to foreign companies and/or initially in joint venture with foreign operators, until they can provide the services required by overseas tourists.

11.7.4 Foreign Assistance and Debt

U.S. foreign-policy critic Noam Chomsky says the people who actually received the loans should repay the debt - the U.S. imposed dictators, who siphoned off billions to their private bank accounts. Uganda incurred most of its debt during dictator Idi Amin's repressive regime. If the U.S. disapproved, would the World Bank have given him those loans? Meanwhile, the people have been forced to pay them back, thus continuing the repression Amin started (Jensen, 2002) (see Chapter 12, Section 12.5, DEBT AND STRUCTURAL ADJUSTMENT POLICIES).

11.7.5 Foreign Assistance and Structural Adjustment

Foreign Aid is integrally linked to Structural Adjustment (SAP). Structural Adjustment consists of prescribed government fiscal and economic reforms, which are required as a prerequisite to foreign aid (see Chapter 12, SUBSIDIES, FREE-TRADE, STRUCTURAL ADJUSTMENT AND DEBT RELIEF IN SUB-SAHARAN AFRICA IMPACTS ON RESOURCE EXPLOITATION). Both foreign assistance and structural adjustment tend to involve government-to-government grants and loans.

11.7.6 Foreign Assistance and African Governments, the Major Employers in Post-colonial Africa

The role of governments is not to create an economy and to employ the majority of the people. This is the role of the private sector. Until the late 1980s, Sub-Saharan African governments were the largest employers of educated people. By the late 1980s, there were more educated people than governments could employ. Structural adjustment (SAP), and rightfully so, forced many of these bloated inefficient bureaucracies to downsize (see Chapter 12, Section 12.3.4.1, Downsizing Governments). People were laid off or given early retirement packages. Unfortunately, the formal private sector was too limited to absorb the laid off bureaucrats or the young people coming into the work force. Foreign assistance and foreign aid/ODA, as a component of foreign assistance, have not improved on the situation. Today, over much of Sub-Saharan Africa, the only thing that a high school or university graduate is guaranteed is unemployment. Wherever possible, the educated youth of Africa, who should be the backbone of its future, are flocking to opportunities in the developed world (see Section 11.13.1.2, What kind of education?).

The role of governments should be to create an enabling environment in which the private sector can help generate wealth and employ people.

Rather than stimulate employment through the private sector as a basis of driving African economies, the “aid industry”, in many African countries, has become the second-largest employer after the public sector. This has spawned thousands of non-entrepreneurial NGOs (Sogge, 2002a) feeding at the international donor trough, who contribute nothing to a country’s economy except to spend taxpayers’ money from the West, handed to them through the donor – another form of international welfare. NGOs would disappear without a trace if the donors pulled

the “aid plug” (Sogge, 2002a). In most cases, they are another layer of bureaucracy between rural communities and the independence of managing their natural resources.

11.7.7 Government Corruption and Foreign Assistance

In many cases, high-level government officials live off of foreign assistance, which they misappropriate. The last thing many ministers want is for development to succeed and then for donor funds, on which they live, to dry up. This could also be argued with NGOs. Any

“leverage (from foreign assistance) is undercut, however, when donors fail to hold recipients to their promises of economic and political reform. This past June, for example, African leaders met with UN Secretary-General Kofi Annan to make a pitch for more aid, with the promise of better governance in exchange. But before rushing to provide more assistance, donors would do well to recall that no African government has ever been disciplined by its neighbors for corruption and incompetence” (Bandow, 2002).

A fine example between 2003-2008, is Zimbabwe, which the African Union refuses to condemn or sanction despite human rights atrocities, destruction of a vibrant economy and a former breadbasket of southern Africa being turned into a major food aid recipient by President Robert Mugabe and the ruling party, ZANU-PF. South Africa, on behalf of SADC, used an ineffective “quiet diplomacy” (see Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife).

Foreign assistance has also been used by the West to buy friends and influence, another form of corruption, which one could argue is a form of “high class prostitution” that often has disastrous impacts on the environment (e.g., subsidizing bananas on the Windward Islands in the Caribbean - see Chapter 8,

Section 8.8.4, Sedimentation Associated With Banana Production, Lessons for Africa; Section 8.9, IMPACTS OF PESTICIDES AND FERTILIZER FROM LAND-BASED POLLUTION ON CARIBBEAN CORAL REEFS, LESSONS FOR AFRICA and Section 11.7.7.1, Lomé Convention and subsidized beef in Botswana). Also see Chapter 12, Section 12.8, CORRUPTION AND FAILURE OF IMF/WORLD BANK PROGRAMS.

11.7.7.1 Lomé Convention and subsidized beef in Botswana

The development of the livestock industry in Botswana dates back to the 1950s, with the development of livestock ranches and the Lobatse abattoir by the Colonial Development Corporation, as well as investment of remittances in livestock sent from Tswana working in South Africa. Until the discovery in the 1970s of diamonds, the cattle industry was Botswana's chief source of income. It continues to be a major source of income for Botswana's rural population and a major source of foreign exchange (Cullis & Watson, 2005).

For more than three decades, Botswana's beef has enjoyed an effective subsidy via privileged access to European markets under the Lomé Convention, also known as the Beef Protocol agreement. The former colonial powers - mainly Britain, France and Belgium - wanted to secure their relationship with the newly independent countries. At the same time, they wanted to ensure that trade between those countries and the EU continued in existing patterns. France had already signed an aid agreement with its African colonies in 1957 in Yaoundé, Cameroon. When the Lomé Convention (Togo) was first signed in 1975, the agreement was revolutionary in linking aid with trade concessions. It was the time of radical developing country initiatives on trade, with talk of a new international economic order and commodity agreements to raise the prices of raw materials. The EU offered preferential access for most of the raw materials and many manufactured

goods from its former colonies, as well as billions of euros in aid.³⁶⁹ The aid program included two stabilization funds, one for agricultural exports and another (set up later) for mineral exports (BBC, 2000). It was also linked into the politics of the Cold War, a way of buying allegiance to the West from the political elite in return for having minimal ties with the Eastern Bloc. Europe obtained the added value of transformation of Sub-Saharan Africa's raw products stimulating its economies, while SSA received a pittance in foreign aid, most of which went back to Europe, as discussed. Europe prospered as a continent, while a few political elite among the African's fared well at the expenses of the masses. This can be considered a form of two-way corruption.

Interestingly enough, while structural adjustment policies (SAPs) (see Chapter 12) discourage agricultural subsidies by Sub-Saharan African countries to their citizens, when it suits the political agenda of the West they will provide SSA and other developing regions (e.g., subsidized bananas in the Caribbean) with subsidies at the expense of its natural systems and wildlife. Botswana, because of the Lomé Convention, receives subsidized prices for its beef from the European Community at about 60% above the world market price. Perkins (1996) places the market subsidy on cattle by the EU at 90%. Cullis and Watson (2005) speak of government subsidies covering up to 50% of production costs that include, in addition to EU subsidies:

- “Veterinary Services: veterinary drugs and vaccinations are largely free, and paid out of general tax revenue.
- Subsidies: bull subsidies, artificial insemination subsidies and borehole-drilling subsidies.
- Indirect Subsidies: interest subsidized loans from the National Development Bank; tax advantages for livestock owners (losses may be written off against profits elsewhere).
- Land Rents: ‘artificially low’ TGLP (Tribal Grazing and Land Policy of 1975) ranch rents.

³⁶⁹ The EU and euros did not exist at that time.

- Dual Grazing: the continuation of dual grazing rights allowing ranchers to move their livestock onto communal lands”.

Beneficiaries are primarily Botswana's political elite (Rosenblum & Williamson, 1990; SCI African Chapter, 1996) who buy inexpensive beef from rural herders and sell to the EU at a profit. According to Perkins (1996), 45% of rural families in Botswana own no cattle, while 7% own half the national herd. Cullis and Watson (2005) place 50% of households without cattle as far back as 1974. This 7% tends to be a wealthy salaried urban elite that have the connections and funds to drill boreholes, thereby taking ownership of the area. It is claimed that back in 1986, one South African with vast holdings in Botswana, exported 33% of the cattle quota of 19,000 tons/year to Europe (Rosenblum & Williamson, 1990). By 1991, 74% of families had no cattle (Cullis & Watson, 2005). These poorer households dropped out of agriculture working as itinerant laborers for subsistence wages. By 1981, 29% of rural households were no longer involved in agriculture, this figure rising to 42% by 1991. Thus, benefits from privatization of the commons have concentrated in the hands of a small number of elite, consisting largely of members or supporters of the ruling party. Economies of scale help these elite with large herds (whose number is decreasing) to maximize benefits from the commercialization of beef production on the rangelands (Cullis & Watson, 2005).

Botswana has about 5,000 major cattle ranchers, many of them government officials. The country has a population of 1.5 million, but also one of the world's greatest disparities between rich and poor. This would amount to 0.33% of the population as major cattle ranchers. According to the United Nations, the income of the wealthiest 20% of Botswana's population is 24 times that of the poorest 20%, a ratio exceeded only by Brazil. While most of Botswana's export earnings come from diamonds, copper and nickel mining, cattle ranching provides a huge return on investment, as much as US\$ 100 million/year or 2% of annual national

export earnings. A study by the International Labor Organization (ILO) noted that the return on investment in cattle was 2 to 1 in a non-drought year, but as much as 50 to 1 in a drought year (TED, 1992).

There are on the average two herd owners/borehole with herd sizes of 500 head or more/borehole. Livestock ownership by herders, employed by the urban elite who might visit the cattle post once a year, is negligible, amounting to a few goats and donkeys. The livestock industry employs 30-40% of Botswana's population. However, the majority live in poverty as herders and cattle post residents at a subsistence level, their payment being in rations (sorghum or mealie meal). These poor, including Bushmen, rely on milk from the cattle and food aid to survive. A few wealthy individuals via agents, purchase livestock from small herders, fatten them, and sell them to the Botswana Meat Commission (BMC) at lucrative prices. Strong linkages exist between cattle posts/boreholes, the future of wildlife and the socio-economic situation of Bushmen and cattle post residents. The continual promotion of privatization and commercialization by the EU and World Bank is impacting the future of both Remote Area Dwellers (RADs) and wildlife (Perkins, 1996) (see Chapter 3, Section 3.4.2.3, The legal exclusion of the African hunter from his wildlife - Loss of Hunting and Territorial Rights by "San" Bushmen, Botswana).

In order to assure beef destined for export to Europe is foot and mouth disease free, cordone veterinary fences are required that keep out wildlife (SCI African Chapter, 1996). According to Rosenblum and Williamson (1987), the World Bank has funded at least three of these cattle projects, which ecologist feared would devastate more rangeland and kill off wildlife in large numbers. Two of the projects in the 1970s, costing more than US\$ 10 million, to raise more cattle in western Botswana were declared failures in evaluations by the International Livestock Center for Africa (ILCA). Even though the ILCA advised the World

Bank to get out of livestock in Botswana they funded the third project at a cost of US\$ 17 million in 1986, while Botswana was importing 90% of its grain to feed its population of one million people. Beef was not food, but power, status and wealth. Food aid was free, a budgetary subsidy.

Botswana's national cattle herd has grown from a few hundred thousand cattle in 1950 to close to three million today. Beef exports to Europe are worth more than \$100 million a year to Botswana (Rosenblum & Williamson, 1990; TED, 1992).

In 1986 alone, it is estimated that the EU bought 750,000 pounds of surplus beef, (e.g., from Botswana, Namibia and Zimbabwe) worth US\$ 2 billion that was rotting in storage. This beef was then sold by the EU, at 33% of the price paid to Botswana, to Russia and then the EU turned around and bought beef to send from Europe to next door Angola (Rosenblum & Williamson, 1990).

When drought hit the country in the early 1990s, the Botswana Meat Commission (BMC), which fixes prices for beef, paid high prices to provide short-term gains for livestock sellers, providing a direct incentive to increase stocking rates. BMC has also set the lowest prices at the onset of the dry season, thereby providing a disincentive to farmers to sell off excess stock during periods when the range is under highest ecological stress. Livestock owners are provided with essential services at low cost, including veterinary services, veterinary cordon fences, development of boreholes to provide water to cattle, improvements to trek routes and low land rents on tribal lands, making them attractive to cattle grazing. The short-term gains to relatively few ranchers in Botswana has sent significant amounts of beef to Europe at the cost of the long-term productivity of the biological resources in Botswana's arid lands (McNeely, 1988).

In the Okavango Delta, movements of wildlife to and from the Okavango region are now restricted on the west and south by the buffalo “veterinary” fence to assure foot and mouth disease free cattle for export to Europe. The buffalo fence, Kuke fence, human settlement and the accompanying expansion of livestock restrict north-south movements of wildlife in Ngamiland and Chobe. With the exception of elephants ($1/\text{km}^2$ density), wildlife populations are becoming increasingly restricted to parks and protected areas as human/livestock densities proliferate. The parks and protected areas alone, cannot maintain this resource in its present abundance. Declines of key indicator species have occurred over the past decade in the Northwestern System (SCI African Chapter, 1996) (Table 11.7):

Table 11.7: Change in indicator species populations, Okavango Delta

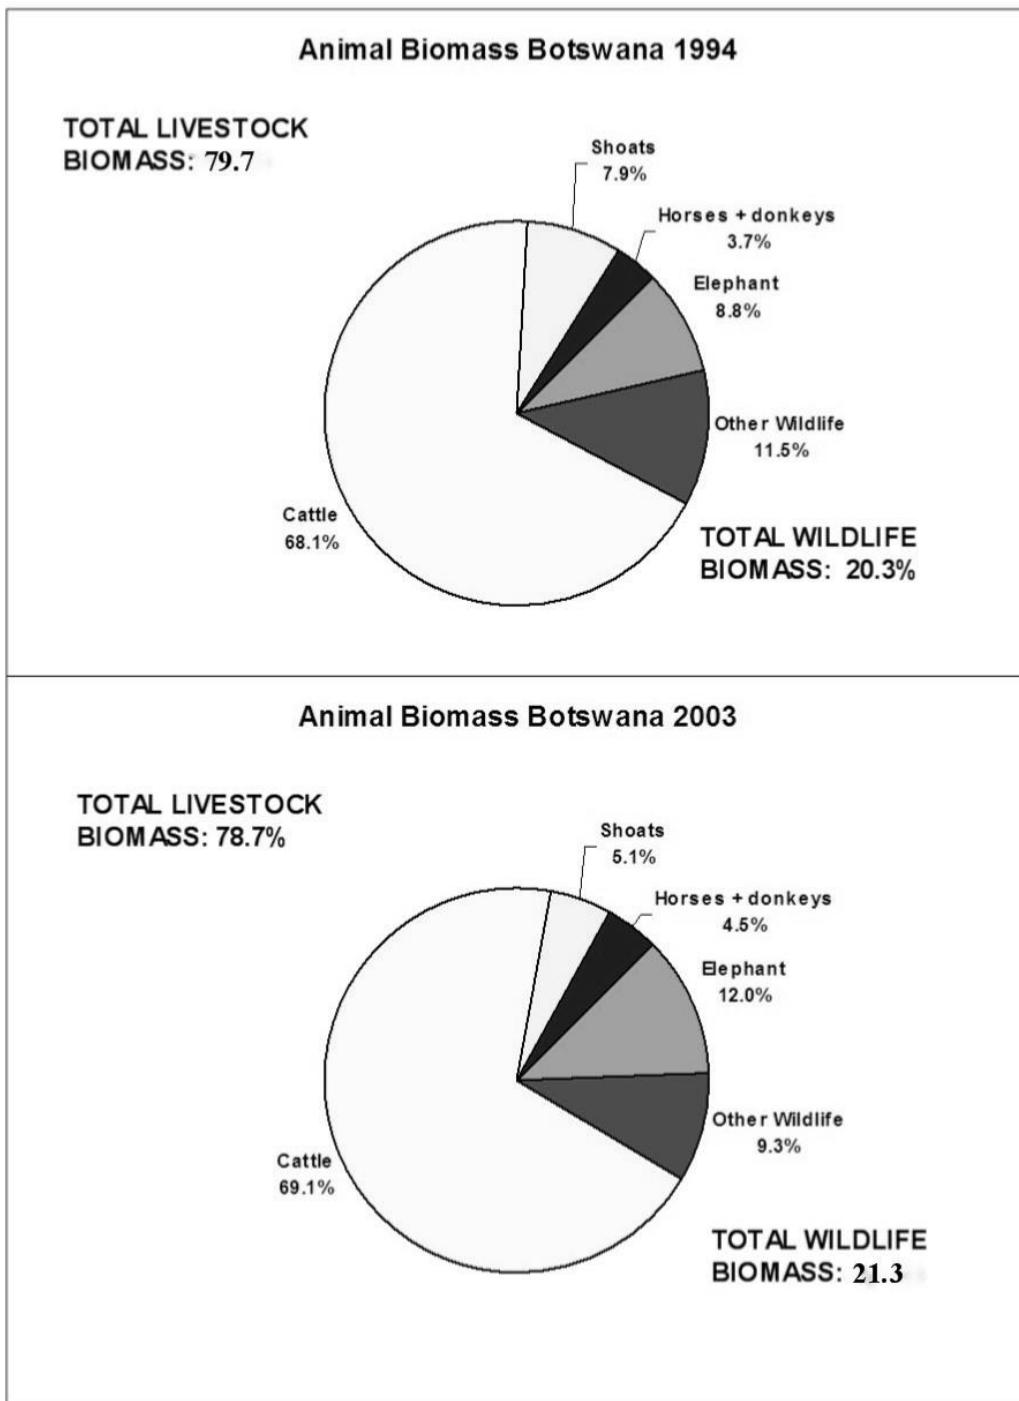

SPECIES	YEAR 1987	YEAR 1994	% CHANGE
-	45,449	78,304	+72
Elephant	72,290	29,037	-60
Buffalo	64,808	46,787	-28
Zebra			

Extracted from: Crowe (1995) with permission of Kalahari Conservation Society (KCS).

Other animals on the decline are roan antelope, sable, waterbuck and tsessebe. Lechwe populations are on an increase. These declines are attributable to the shifting ratio of elephant versus other mammalian biomass, declining floods in the Okavango Delta (major declines in flooding 1994, 95, 96), uncontrolled citizen hunting and inaccessibility to traditional ranges from veterinary fences. Concern exists that the continued increase in biomass of the elephant will be at the expense of other wildlife, their habitat and thus, biodiversity. In 1991, it was estimated that elephant made up 51% of the total wildlife biomass in Chobe and Ngamiland Districts, which increased to 60% by 1994, resulting in a negative impact on biodiversity (Crowe, 1995). Increased elephant populations are resulting in

increased human conflict. Some people say that if the biomass of animals for Botswana as a whole is compared, there has been no change, except that livestock (and it could be argued elephant) is rapidly replacing wildlife as the dominant animal in this biomass (Figure 11.1) (SCI African Chapter, 1996); 79.7% of the biomass being from livestock versus 20.3% for wildlife country-wide in 1994 with little change in 2003, 78.7% versus 21.3% respectively (BWNP, 1994; 2003). Similarly, Cumming (2005) concludes that for southern Africa as a whole, wildlife makes up only 10% of the large herbivore biomass today.

Thomson (2003) believes that any negative trends in lion populations, where elephant numbers have significantly out-competed lion prey species such as buffalo and zebra, are attributed to this competition as opposed to adverse impacts from the limited offtake of trophy hunting (see Chapter 9, Section 9.6.3.4, Botswana Community Trust Program). There are many more lions overflowing the saturated Okavango Delta into livestock areas that are killed as problem animals, than taken by trophy hunters (see Chapter 9, Section 9.6.3.4, Botswana Community Trust Program). The animal rights use misinformation and propaganda to blame any declines on sustainable use, especially sport-hunters, and not their own Western-urban preservationist policies that are being imposed on Sub-Saharan Africa, with little or no understanding of the ecological or economic consequences of their antiquated foreign policies. In this case, the outdated Cold War policy of the Lomé Convention should be reconsidered.

Boggs (2000) shows a major decline in wildlife between 1978 and 1994 in Southwestern Botswana, but possibly for a more limited area, the Southern Kalahari System (Table 11.9).

Gemsbok, springbok, eland and, to a lesser degree, wildebeest, normally able to live from water in their food, are water dependent during drought periods (Owen-Smith, 1996). Owen-Smith (1996) estimated in the Kalahari region of south-central Botswana, population declines during the drought of 1979-1986 amounted to 90% for wildebeest, 70% for hartebeest, 50% for kudu and over 30% for gemsbok and springbok due to migration blockages from cordone veterinary fences that cut these animals off from accessing water. These fences were required from the 60% subsidization of beef by the Lomé Convention to assure foot and mouth free beef from Botswana into Europe.

SPECIES	Kalahari System		Known Distribution	
	1978	1994	1978	1994
Zebra	100,000	20,863	Numerous & Widespread	Decimated but Widespread
Hartebeest	293,462	44,737	Numerous & Widespread	Decimated but Widespread
Wildebeest	315,058	17,934	Numerous & Widespread	Decimated but widespread
Springbok	101,408	67,777	Widespread But Clumped	Widespread & Concentrated
Kudu	6,429	7,849		
Ostrich	92,286	27,744	Widespread	Widespread

Migration corridors may be needed if these declines are to be reversed. In both cases, Western donors have given an artificial comparative advantage to livestock over wildlife (SCI African Chapter, 1996). What will happen when these subsidies end? Rosenblum and Williamson (1987) also blame a De Beers/Botswana “Debswana” consortium for pumping Lake Xau dry in 1983 to wash diamonds, pumping water to a narrower and deeper Mopipi Reservoir. This resulted in a major dieoff of wildebeest from thirst.

Cullis and Watson (2005) relate the decline in Botswana’s wildlife over the past 30 years to the following, in addition to veterinary fences:

- Fencing of commercial ranches, limiting wildlife movement, especially critical during drought.

- Direct displacement of wildlife by livestock as their numbers increase, including disease.
- Boreholes allowing expansion of livestock into areas previously only available to wildlife.
- Human population increases, including poaching.
- Mineral exploration.

“As a result of these and other factors, wildlife is increasingly restricted to protected areas, which are not sufficient (in size or nutritional value) to support the current numbers of wildlife without seasonal movement. It is probable therefore that wildlife numbers will decrease further in the future” (Jones, 1999 *In: Cullis & Watson, 2005*).

As a result, the protein that hunting of Kalahari wildlife supplied to hunter-gatherers and other rural communities has now disappeared. It appears to have struck nobody in the outside world that declaring concern for the Basarwa (Bushmen of the Central Kalahari Game Reserve (CKGR), while preserving Botswana's Beef Protocol agreement with the European Union (EU), smacks of hypocrisy (Perkins, 2002).

11.7.7.2 Mismanagement, corruption and classified forests, Senegal

See Chapter 5, Section 5.9.4.7, Deforestation in savanna environments - Deforestation in Senegal Linked to Charcoal Making, Over-Population and Declining Fallow Periods.

11.7.8 Foreign Assistance for Agriculture in The Sahel

The Sahel provides a good case study of just what is wrong with much Western aid. The Sahel Development Program is a massive scheme supported by billions of dollars from the UN Food and Agricultural Organization (FAO) and countries like France, Holland, Belgium and the U.S. Its purpose is to 'rid the Sahel of food shortages and ecological deterioration, to overcome dependency and to raise the incomes and quality of life for 26 million people.' To do this, the project has created a series of large-scale food production schemes over eight countries, producing everything from rice (for urban areas) to beef cattle (for export). Only 16% of the billions of dollars of aid went to rain-fed crops that the poor peasants and nomads of the Sahel depend on to survive. Most of the farming schemes involved large-scale irrigation and mechanized agriculture run by state parastatals that excluded peasants. Little attention was paid to increase badly needed storage facilities or to ensure a fair distribution of the newly grown food. Many of these large scale irrigation schemes have failed, while wiping out traditional production systems and making rural people poorer and worse off nutritionally, to some degree benefiting political elites of the host countries, aid bureaucrats, construction companies and consulting firms (see Chapter 5, Sections 5.6.3.2, Foreign assistance in Sahel goes for large scale as opposed to improving traditional agriculture and 5.12.1.3, Irrigation potential, and Chapter 7, IMPACTS OF DAMS ON CONSERVATION AND DEVELOPMENT IN SUB-SAHARAN AFRICA). The Sahel Development Program, like much of the aid going to Sub-Saharan Africa, reflects more the ideas and interests of the donors than the needs of Africa's poor (Elwood, 1984).

11.7.9 Foreign Assistance, Programmed for Failure

C. Payne Lucas (1981), an African American and former president (retired) of AFRICARE, a development NGO, had this to say about foreign aid/ODA:

“...our U.S. Agency for International Development (USAID) program officers frequently are asked to design multimillion-dollar programs with the benefit of little or no reliable baseline data on economic, educational or health conditions in the target country. All too often we recruit a Ph.D. agronomist, for example, from one of our snowbound university campuses, send him almost immediately to his work site and expect him to succeed in increasing agricultural production in a semi-arid developing country -- one with no farm-to-market roads, inadequate sources of energy and a bureaucracy whose leadership changes hands every 6 months. Frequently such technical assistance is further short-circuited because the American adviser has been taught nothing of the culture or language of the people he has been sent to help. He has been programmed for failure, at a cost to the U.S. taxpayer of nearly \$175,000 each year”.

Chabal and Daloz (1999) come to similar conclusions, that within the context of the Cold War following independence of Sub-Saharan African countries in the 1960s, development theory resulted in the mechanical transposition of concepts fashioned in Western/Eastern settings so that during “at least 2 decades, so-called experts merely transferred their blueprints to an environment whose historical, social and cultural specificities they hardly knew, or even cared to discover”. As this book also demonstrates, they had little understanding of ecological constraints, traditional management systems, nor African ties to their land and natural resources. In fact, often African’s technical knowledge surpasses the so-called experts brought in to advise them (Martin & O’Meara, 1995), since these “experts” understand temperate ecology and Western cultures and try to apply these same principles to Sub-Saharan African ecology and African cultures, often resulting in unmitigated failures.

The most important form of government “assistance” is the least justified: economic or development aid.

Such programs were instituted 40 years ago when people believed the Third World was poor because it lacked money. Today we know that is not true. The result has been an expensive wasteland, strewn with spectacular failures. For instance, Zaire (the Democratic Republic of Congo) received some \$8.5 billion from a multitude of sources between 1970 and 1994, but imploded around 1998 (see Chapter 13, Section 13.10.3, Congo-Kinshasa DRC, Sub-Saharan Africa’s world resource war). Former USAID Administrator J. Brian Atwood acknowledged that the investment of over \$2 billion of American foreign aid in Zaire served no purpose. Yet in 1996, UN Ambassador Bill Richardson made a pilgrimage to the Democratic Republic of Congo, promising to provide \$50 million in aid to the new dictator, Laurent Kabil, despite his authoritarian tendencies and the atrocities committed by his military. Virtually every nation in crisis, from Somalia to Liberia to Haiti to Burundi, has received billions of dollars from the West (Bandow, 2002).

In May 2002, U.S. Treasury Secretary Paul O’Neill (former CEO of Alcoa Aluminum) asked on a visit to Sub-Saharan Africa (Editor, 2002),

‘There has been a trillion dollars spent over the last 50 years. At least for me, I have to say, I don’t understand why one of life’s most important conditions, namely clean water hasn’t been resolved. Last year the World Bank spent \$US 300 million in Uganda. What was so important that there wasn’t \$US 25 million to \$US 30 million to give everyone in Uganda clean water.’ Throughout the developing world, waterborne diseases kill an estimated 1.5 million people annually most of whom are children under the age of 5. He considered defeatist the United Nations goal of reducing global poverty by 50% by 2015 (see Chapter 13, Section 13.12.3, Role of private sector versus foreign aid in

economic development), ‘That’s my aggravation, frankly, with the developing community. It’s always tomorrow. For people alive today, their tomorrows are going down every day. How many millions of children are you going to lose between the ages of 0 and 5 between now and 2015 because we don’t do water?’

This editorial goes on to call such development gaps, “arguably the greatest tragedy of the new millennium” (Editor, 2002). Soon after, politics forced Mr. O’Neill to resign. Maybe he was too honest and frank. In Sub-Saharan Africa today, almost 50% of the population lacks access to safe water and adequate sanitation services (Colgan, 2002).

“Perhaps even more staggering is the failure to discern any positive relationship between aid levels and economic growth. Foreign aid actually discourages reform by cushioning the price of policy failure and reducing the urgency of making politically painful changes” (Bandow, 2002).

The United Nations Development Program reported in 1996 that 70 developing countries were poorer then, than they were in 1980; 43 were poorer than they were in 1970. USAID itself acknowledged in a 1989 report that

“‘only a handful of countries that started receiving U.S. assistance in the 1950s and 1960s have ever graduated from dependent status.’ Yet 13 years later, the ideological commitment to state-led development planning funded by the West is alive and well, and the international affairs establishment has continued to push for more money” (Bandow, 2002).

The chapters on boreholes (Chapter 6), dams (Chapter 7) and coastal development (Chapter 8) discussed Westerners misusing northern climate technologies; many by “experts” sent over by foreign aid/assistance to solve the Third World’s problems, but with little or no understanding of ecological constraints, or knowing, but not caring, since they did not have to suffer the consequences of development failures. The following are a few examples of development follies funded by Western donors.

11.7.9.1 Bintang Bolon, the Gambia – Nordic economist knows best

The Bintang Bolon lies about an hour east and upriver of Banjul, the capital of the Gambia, on the South Bank of the Gambia River. In the early 1980s, the US Government hired a team of “American Experts”, the principal author being one of them, to advise the Gambia River Basin Development Organization/*Organisation pour la Mise en Valeur du Fleuve Gambie* (OMVG) on environmental, social, health and economic aspects of developing the river basin. One of the first issues was that the mangroves of the Gambia were supposedly dieing. If in fact this was widespread, which it wasn’t, it would have helped support the argument for building the Balingho Anti-Salinity, which was projected to destroy most of the mangroves. The supposed disease was believed to be indicated by a boll – or knob on the tree. The greatest concentration of dead trees was along the Bintang Bolon in the Gambia. The natural resource economist,³⁷⁰ a Norwegian who had come to the USA on a ski scholarship, suggested clear-cutting the Gambia’s mangroves and replanting them with salt tolerant trees. The absurdity of this is beyond belief. This “expert” had no idea of the role of mangroves in the detrital food chain that fed the rich fisheries of the Gambia and mangrove estuaries around the world. At the end of the day, it was discovered that the major cause for the dead mangroves appeared to be primarily from small farmers, at the headwaters of Bintang Bolon, diking off the bolon in order to farm swamp rice (DeGeorges, 1987).³⁷¹ The modified hydrology affected soil chemistry resulting in hypersaline soils, acidic low pH soils and likely heavy metal pollution (see Chapter 7, Figure 7.13: Interrelated factors

³⁷⁰ Kjell A. Christophersen, CCbenefits, Inc., 121 Sweet Ave., 2368 Arborcrest Rd., Moscow ID 83843, Moscow ID, 83843, Tel: 208-882-4842, Tel: 208-885-5671, Fax: 208-882-2467, Fax: 208-885-3803, e-mail: christophersen@turbonet.com.

³⁷¹ Hubert Forester of GTZ working for the Water Resources Department, Banjul, the Gambia, had seen on aerial photographs what appeared to be diking by small farmers. The author and Gambian fisheries department officials made a survey of the area verifying this to be the case at the village of Boudouk.

resulting in regional regression of mangroves, decreased fish yields and diversity in West Africa) (DeGeorges, 1987) (see Chapter 5 Section 5.6.3.2, Foreign assistance in Sahel goes for large scale as opposed to improving traditional agriculture, The Casamance, Senegal Traditional Rice Culture, Versus Modern Interventions).

If there was any disease, and this was never proven, it was due to the physiologically weakened and stressed mangroves in one isolated bolon whose hydrology and soil chemistry were modified by man. The remainder of the mangrove system appeared to exhibit only a natural level of mortality seen in any forest ecosystem. A potential ecological and human tragedy by recommendations emanating from an expatriate Ph.D. resource economist, a so called “expert” was stopped, the clear-cutting of an entire mangrove ecosystem, which extends 209 km (130 miles) upriver from the capital of the Gambia, Banjul/the river mouth.

11.7.9.2 Barrage De Affiniam, Casamance, Senegal; foreign assistance big money, ecological destruction

This is an example of a development project undertaken by foreign technicians without any understanding of how the ecosystem functions in which they were working.

Working with the traditional **Jola (Diola)** rice farmers to construct improved “mini-barrages” of concrete instead of earth, undertaken on a pilot scale in the 1980s, appeared relatively successful and would seem to be the way to go (tidal rice on advanced mangrove soils – see Case Study, Chapter 5, Section 5.6.3.2, Foreign assistance in Sahel goes for large scale as opposed to improving traditional agriculture, The Casamance, Senegal Traditional Rice Culture, Versus

Modern Interventions and Chapter 7, Section 7.9.7.3, Hypersalinity, the evolution of mangroves in West Africa and its effects on fish stocks – case studies of the Casamance and Sine Saloum Estuaries).

The other extreme was the Barrage de Affiniam, a large dam that inundated many hectares in an area of the Casamance where the estuary was hypersaline, in the vicinity of 44 parts per thousands (the sea is 35 ppt.³⁷²) (see Chapter 7, Section 7.8.7.3, Hypersalinity, the evolution of mangroves in West Africa and its effects on fish stocks – case studies of the Casamance and Siné Saloum Estuaries). The dam was built by the Chinese. How they ever expected to drain the inundation zone of hypersaline water and replace it with freshwater, is beyond imagination. When the head of the Chinese team was asked by a multi-disciplinary team, of which the principal author was a member, how he planned to successfully operate the barrage, his reply was, “I build dams. It is up to someone else to make them work”. To the principal author’s knowledge, this dam has never irrigated or grown rice and is another relic of Cold War politics, as well as an experimental ground in development failures. All the money went back to China and donor money that could have been used for development was wasted; good business for the Chinese, and an ecological and development disaster for Senegal.

A recent description of development needs by the Senegalese Ministry of Economy and Finance (Republic of Senegal, 2003) admits the failure of the “state” led development of the Barrage de Affiniam. The Senegalese Ministry of Economy and Finance (Republic of Senegal, 2003) and the National Advisory of Planning and Rural Cooperation (CNCR, 1999) both suggest rehabilitating this barrage. Is this possible?

11.7.9.3 The white mountain of Turkana

³⁷² ppt. = Parts Per Thousand

Lake Turkana of Northern Kenya is surrounded by desolate, volcanic mountains. The 274 km (170 mile) long lake has no outlet, becoming increasingly saline. It was formerly known as Lake Rudolf. Living around this lake are the Turkana of northwest Kenya, a herding people of Nilotc decent. They are continuously at war over livestock with the Pokot of Kenya and Karamojong of neighboring Uganda. Various studies by the UN Food and Agricultural Organization (FAO) and the British concluded that the range was being over-grazed by livestock of the approximately 220,000 Turkana herdsmen (Rosenblum & Williamson, 1990; Harden, 1991), and that the solution was to wean them off their milk diet onto another source of protein. Someone came up with the bright idea that converting them into fishermen on Lake Turkana would be the solution (Harden, 1991). The Italian Government built the "Fish Farm" at Kalakol on Lake Turkana (Powys, 2002) and the 1970 Norwegian government built the cold-storage fish factory (Harden, 1991) at a cost of US\$ 2 million (Rosenblum & Williamson, 1990) to help the development of the Turkana Fishermen's Cooperative (TFCS). The cold storage facility never processed a single fillet. "It stands there beautifully intact as a memorial to misguided aid" (Powys, 2002). The Norwegian's also built a US\$ 20 million dollar highway to take the "frozen" tilapia and Nile perch to major urban markets (Harden, 1991). The cost of bringing the 100° F (37.8° C) ambient temperatures to below freezing, cost more than the fillet's were worth and production demanded more clean water than the Turkana District had to offer (Harden, 1991). The state-of-the-art fish processing freezer and cold storage plant was constructed on a hillside not far from the lake. The nomadic Turkana, who despise fish, ended up using the boats as temporary huts (Salopek, 2001). The fish processing plant "stands there beautifully intact as a memorial to misguided aid".

Now, the plant is used to store dried fish (Rosenblum & Williamson, 1990; Harden, 1991; Maykuth, 2000) by a local fishing cooperative that is on the verge

of collapse after a US\$ 2 million Japanese government project to provide better equipment and access to markets pulled out because of insecurity in the area. Roderick Kundu, the Kenyan district fisheries officer in Kalokol, said the problem with the aid projects was that they did not turn the Turkana into commercial fishermen. Likewise, the Italian-built fish farm in Kalokol is empty and protected by guards until it can be sold. It collapsed after the Kenyan government took over the enterprise. Fishermen are now exploiting only 20% (one-fifth) of the lake's sustainable yield. The lake could feed half the population of Turkana (Maykuth, 2000).

Key factors that resulted in the failure of this plant to ever process even one fish are: 1) The donor failed to assess socio-cultural constraints, the Turkana having been herders for hundreds of years with no interest in fishing, 2) Turkana who fished were looked down upon as people who were incapable of maintaining livestock, 3) Like with many herders, fish were not and would never be a part of their diet unless faced with severe drought and 4) There was a major drought and the lake receded about 10 km from the lake edge. The factory closed down in 1986 when Ferguson's Gulf dried up – fed by the Omo River from Ethiopia. It is believed a small percentage of the poorest Turkana have tried fishing. About 20,000 Turkana herded to the lake by the donors lost their cattle from overgrazing and disease during the drought, there were no fish to catch and so they became welfare beggars on food aid (Rosenblum & Williamson, 1990).

To this day, the fish processing plants sit on a hillside not far from Lodwar, named the “White Mountain” by the Turkana because of the color of the plant that gleams in the noonday sun as another Western donor failure.

Both FAO and the Norwegian Agency for International Development (NORAD) also tried to turn the Turkana into farmers. About 10,000 Turkana herders had

been turned into farmers at a cost of US\$ 25,000/farmer so that he could earn US\$ 100/year, 25% of Kenya's per capita income (Rosenblum & Williamson, 1987).

Following the El Nino rains in the Ethiopian Highlands in the last two years, the Ferguson's Gulf - a protected cove to the Northwest of the lake - has again filled up and fish catches have suddenly increased, making the lake the main source of fish in the country. The World Bank, through the Arid Lands Management Project (ARLMP) community development program, has already donated 48 fishing boats and more than 400 fishing nets and hooks. The local fishermen are already receiving training on net making and repair. The fishermen appear to be mostly Luo from western Kenya, along Lake Victoria. Whichever way one looks at the current fish boom, it is likely to generate much controversy and debate, and it will be interesting to see how the local people utilize the resource before the lake does its next disappearing act (Kamu, 1999). Now plans are to revive the failed fish plant (The Nation, 2003). Let us hope there are lessons to be learned.

11.7.9.4 Rube Goldberg and salt production in Uganda

Katwe Salt Works dates back centuries. Katwe Salt Works was managed by the Bagabo clan, which along with nearby Kasenyi Salt Works, supplied western Uganda and Rwanda (Chrétien, 2003). Lake Katwe, a Crater Lake in the Kasese District, is situated in an enclave within modern day Queen Elizabeth National Park in western Uganda. It serves as a legacy to Western donor failure in the development of Africa. The Lakebed is 0.8 m thick and contains over 12 million tons of salt, varying in composition with depth. The lakebed has salt stocks that can sustain an industrial extraction plant with a production rate of seven tons of salt/hour for 34 years (AAITP, 2003).

Traditionally, and as is still the case, salt is produced in naturally occurring brine ponds through evaporating the water, drying and bagging the crystallized salt. It

employs about 2,000 people. Despite being unlicensed from a mining perspective, the artisanal extraction of salt has become legitimized, with the Katwe Local Authority imposing taxes on salt from the works (MSDTA, 2003).

To extract and recover one or more salts from Lake Katwe brine deposits, a German Consulting group (Deutsche Bertungsgesellschaft Fur SalinenTechnik, DBS)³⁷³ concluded in 1970 that it would be economically viable to erect a plant to extract common salt and potassium chloride from Lake Katwe. In 1975, a contract was awarded to Thyssen Rheinstahl Technik GmbH (TRT)³⁷⁴ for the supply and erection of the plant machinery. Roko Construction³⁷⁵ was contracted to carry out the civil works (AAITP, 2003).

When the plant was due for commissioning in 1980, difficulties were experienced because of electricity failures, pipe and equipment blockages and difficulties in blockage cleaning as a result of poor plant layout. There were many design, control and instrumentation problems, resulting in ineffective operation of the salt plant. Insufficient spare parts, failures from poorly installed equipment and corrosion of equipment, apparently from application of an incorrect technology, were the major weaknesses that affected the plant. The plant was finally commissioned in June 1980 with these inherent weaknesses (AAITP, 2003). It is said to have functioned for only a few weeks before the pipes corroded shut.

A number of consulting firms were contracted between 1982 and 1985, concluding that it was technically feasible to extract salt at the plant if the corrosion, salt brine stability and “solubility curve accuracy” problems could be overcome. It was also found out that only very expensive materials could solve

³⁷³ Can not find on internet. May no longer be in existence.

³⁷⁴ German firm, locate name on internet but no address or website.

³⁷⁵ Roko Construction Ltd., International and Multinational Private company, P.O. Box 172, Plot 160, Bombo Rd, Kawempe Zone, Kampala, Uganda, Phone: 256 41 567331, Fax: 256 41 567784 from www.enteruganda.com/business/business_directory_alphabet.php?

the corrosion problems at the plant, hence compromising the economic viability of the plant (AAITP, 2003).

In 1995, the Ugandan Government, through the Uganda Development Corporation (UDC) and with the assistance of the African Development Bank/*Banque Africaine de Developpement* (ADB/BAD), commissioned a feasibility study to assess the viability of rehabilitating the existing plant at Lake Katwe to recover 40,000 tons of salt per annum. The study, by Sabbour Associates,³⁷⁶ in association with Booz Allen UK,³⁷⁷ commenced in 1996 and was completed in 1997 at a cost of European Currency Unit (ECU) 460,000. The findings of the study to rehabilitate the existing thermal extraction plant were (AAITP, 2003):

- Estimated cost of rehabilitating the existing plant is US\$ 20-22 million;
- Annual operating costs would be higher than desired, hence resulting in a marginal project;
- 40,000 tons/year of salt at 95% purity could be produced at the rehabilitated plant, which is below the 97% purity standard set by the Ugandan National Bureau of Standards for edible salt. Salt of 97% purity could be produced with the corresponding losses in amounts produced (28,000 tons/year) after further refining.
- The plant would employ approximately 140 people of varying skills; and
- The rehabilitated plant would have a marginal Internal Rate of Return.

The 1996 evaluation by Sabbour Associates revealed that the existing processing plant assets are in a very poor state of repair. A structural analysis on all existing

³⁷⁶ Sabbour Associates, 20 Lotfi Hassouna Street, Dokki, Cairo, Egypt, Tel: +202 7494964, Fax: +202 7494963, main@sabbour-associates.com, www.sabbour-associates.com

³⁷⁷ Booze Allen Headquarters, 8283 Greensboro Drive, McLean, Virginia 22102, +1 (703) 902-5000. No U.K. address, only a website bringing one to U.S. address, www.bah.co.uk/

buildings concluded that none of the buildings (production and staff housing) have structural defects. The structural analysis also revealed that the buildings are also suitable for other industries such as cotton spinning or warehousing.

In view of the envisaged problems with the existing plant, even after rehabilitation, the consultants carried out a pilot study of an alternative – Combined Cooling and Evaporation Process - that proved the most beneficial in comparison to the existing process after rehabilitation. The critical success factors for the alternative process were (AAITP, 2003):

- Estimated Capital cost would be US\$ 30-35 million;
- Acceptable operating costs resulting in a financially viable project;
- 40,000 tons of salt (NaCl) at >97% purity, which complies with the Uganda Bureau of standards for edible salt, would be produced per year;
- Also, 19,000 tons of Sodium Sulphate and 17,000 tons of Potassium Chloride, valuable by-products, would be produced per year;
- Approximately 140 people of varying skills would be employed;
- A profitable Internal Rate of Return (14%) would be achieved; and
- The additional by-products are raw materials for the production of detergents and fertilizers. This is a potential to promote additional industrial development in Uganda.

The Lake Katwe Salt Project has assets held under a company registered in the names of Lake Katwe Salt Company Ltd. The assets include land, buildings, basic infrastructure on the ground near Lake Katwe and the processing plant (AAITP, 2003).

Currently, there is no operational activity carried out by the project. There is only a residual caretaker staff of 12 employees whose costs are funded by the

Enterprise Development Project and are tasked to ensure the security and maintenance of the assets (AAITP, 2003).

The Kasese district government and the Lake Katwe town government contested the ownership of Lake Katwe (Mobbs, 1999). It would also appear that the 2,000 people employed by traditional production would not like being displaced by a high tech industry employing only 140 people. Is this considered progress on a continent and in a country with high unemployment?

“At present all salt approved for human consumption in Uganda is imported. Most imports originate in Kenya and total over 60,000 tons/year, which is above the 40,000 tons expected to be industrially extracted from Lake Katwe. Salt is generally a low value commodity and therefore uneconomic to transport over long distances. This spells potential for the Lake Katwe produced salt, with regard to the market in the western axis of the country and the neighboring countries thereof, over the Kenyan produced salt” (AAITP, 2003).

Had the salt factory functioned, it would have ruined Lake Munyanyange, which is a natural bird sanctuary and Uganda's only regular site for Avocets (Booth, 2002/10/28). The plant stands today, a Rube Goldberg monstrosity mesh of pipes rising to the height of a four to five story building. Side by side, still producing salt as they have for hundreds of years, are functional salt drying ponds effectively run by local entrepreneurs.

11.7.10 Agricultural Bias of Foreign Aid by USAID

It was not until the late 1980s that foreign aid began looking at natural system management – that is the sustainable use of timber, wildlife, fisheries, etc. (see Chapter 9 on CBNRM). For the first 30 years of its existence, agricultural economists, who had little or no understanding for how ecosystems functioned, dominated USAID. Very often, as discussed in Chapters five and six, the technological fixes in agriculture and range management were inappropriate, given the ecology of Sub-Saharan Africa's natural systems, the lack of training in intensive management of their natural resources and the application of these technologies by rural Africans. Rural Africans knew how to drive a bicycle, but were given a mirage/F-16 fighter plane. They crashed, both in applying these technologies and in sustainably managing an environment over-populated with people and their livestock, with inappropriate land tenure systems exasperating these problems as an outcome of colonialism and the last 40 years of independence. These agricultural economists viewed all of Sub-Saharan Africa's ills as being solved through agriculture. This included tree farming as opposed to natural forest management, fish culture as opposed to natural fishery management and livestock as opposed to wildlife management in savanna areas. In essence, they saw Sub-Saharan Africa as “one vast corn field” with everything planted neatly in a row. Some have called this “integrated rural development”, solving all the development ills of Sub-Saharan Africa on the farm, and it has failed (see Section 11.10.1, Foreign Aid for “Conservation”? and Section 11.10.6.2, “Conservation and development” a continuation of failed “integrated rural development” linked to “preservation”). One of the main reasons for this is that rural Africans traditionally have not only live off their farm produce, but a diverse array of wild products from fallow lands, the bush, forests and savannas. Until about 15 years ago, this was the case for most Western donors. Be sure, that all these donors are controlled by economists/politicians and not ecologists, or there would be drastic differences in how money is spent and the accountability required.

11.8 FOOD AID

Food aid in essence is the dumping of mostly subsidized grains, usually maize, from America or Europe into Sub-Saharan Africa. It is estimated that globally, the United States provides US\$ 1 billion to subsistence farmers or about US\$ 1/farmer in aid (Sachs, 2005). The U.S. also dumps about US\$ 800 million/year in food globally “to feed individuals in crisis, but which does nothing by itself to solve the more fundamental problem of unstable and insufficient food production” (Sachs, 2005). In fact, as will be seen, food dumping actually adversely impacts Sub-Saharan Africa’s ability to feed itself.

11.8.1 Lords of Poverty – Food Aid and Food Dumping in Africa-Detrimental to People and Wildlife

“Relief can be a narcotic. The more that is administered, the greater the dependency. Like a narcotic, it cannot be stopped without grief. Once famine strikes, grain shipments are essential to keep people alive. Yet badly timed relief destroys farming systems and subsidizes the policies that lead to famine” (Rosenblum & Williamson, 1990). “If aid does not support Africans own efforts to produce, it can reduce proud people to beggars” (Rosenblum & Williamson, 1987).

At the July, 2004 African Union summit in Addis Ababa, The Ethiopian Prime Minister Meles Zenawi expressed his concern that food aid breeds dependency, undermining people’s willingness to fend for themselves. His goal is to begin accenting local agricultural production as a means of getting off food aid dependency, a chronic disease in most of Sub-Saharan Africa, by giving peasant farmers access to land and giving them land tenure, transforming small-scale subsistence farming into small-scale commercial farming and developing rural markets (Majtenyi, 2004).

Certainly, it can be argued from a humanitarian point of view that food aid in times of drought helps prevent massive starvation. It can also be argued that from an ecological point of view that food aid - without integration into a balanced public health plan, which includes family planning - allows human populations to grow beyond the carrying capacity of the land to support them. In many cases, as in Somalia and Sudan, major portions of the food aid, with full knowledge of the donor bodies, are diverted to strengthen and allow armies to fight more and better, as no army does well on an empty stomach (see Section, 11.8.6, Food Aid and NGOs in Sudan and Section 11.8.7, Food Aid and War in Somalia). In recent times, food aid has been politicized, as in Zimbabwe (see Chapter 5, Section 5.7.4, Land Reform/Redistribution without Integrating Local Communities as a Constraint to Agricultural Production).

In order to maintain high domestic food prices to the advantage of First World farmers, First World nations usually use one, or both of these techniques (Schoolland, 2002):

1. Prohibit the importation of many agricultural products from the developing countries and/or; and
2. Dump crops abroad under the guise of “foreign aid”.

In some African countries, food dumping has resulted in maize that cost US\$ 74 to produce, selling in the local market for US\$ 21. Once local farmers are put out of business, import prices are often increased, placing the urban poor at the whim of rising world grain prices (Sogge, 2002a).

In the book, “Lords of Poverty”, Hancock (1989) explained how the purpose of international food aid is really to subsidize American and European farmers and is

actually a disincentive to local production. This book was banned in Kenya in the early 1990s. This is reiterated by Bandow (2002), a senior fellow at the Cato Institute and a former special assistant to President Reagan for policy development:

“Food for Peace shipments are more efficient at dispersing domestic agricultural surpluses than feeding starving foreigners. They also have a sad record of ruining indigenous farmers”.

The end result of food aid programs is a complete dependence on food aid for many countries. Food aid destroys Third World food production, creating a perpetual crisis that requires more aid to avoid famine. The cycle continues until the country is completely dependent on free food from abroad. As one analyst put it, foreign aid has become “the opiate of the Third World” that keeps the less developed countries (LDCs) permanently dependent on the West for their very existence (Majewski, 2002) (see Chapter 5, Section 5.6.3.3, Donor subsidized food as a constraint to agricultural production).

The UN Food and Agricultural Organization (FAO) warns that developing countries must become more self-reliant in food production, reversing the policies imposed on them by the Washington Consensus (IMF/World Bank structural adjustment policies [SAPs]) (Chomsky, 1999). This implies that Sub-Saharan African governments must become more active in supporting farmers, possibly subsidizing them to some degree, or setting tariffs and quotas to allow, where possible, some level of internal food security from the West, who is turning them into beggar nations both financially and nutritionally. This implies identifying the 27% of prime agricultural land of Sub-Saharan Africa and managing it on a commercial level as much as possible, to produce food that can feed the nation (see Chapter 5, Section 5.12, THE WAY FORWARD; Chapter 12, Section 12.9.3, Role of Sub-Saharan African Governments in Diversification Through

Industrialization and 13.18.1, Going Local Where Necessary, Development Of Regional Markets).

The impacts of agricultural subsidies on Sub-Saharan Africa will be discussed in some detail in the Chapter 12.

11.8.2 Food Dumping, Malawi

European Union (EU), Common Agricultural Policy (CAP) tariffs and quotas keep Malawi's chief exports of corn and sorghum out of European markets, while at the same time CAP subsidies help European producers crowd out Malawi sales in third-country markets. It is believed that the CAP hurts the continent's ability to attract private investment from overseas, including financial, technological and human capital to drive economic and social development (Hassett & Shapiro, 2003) (see Chapter 12, Section 12.2.4.1, Agricultural tariffs).

11.8.3 Food Dumping, Kenya

Kenya, self-sufficient until the 1980s, now imports 80% of its food, while 80% of its exports are accounted for by agriculture. In 1992, European Union (EU) wheat was sold in Kenya for 39% cheaper than the price paid to European farmers by the EU. In 1993, it was 50% cheaper. Consequently, imports of EU grain rose and in 1995, Kenyan wheat prices collapsed through oversupply, undermining local production and creating poverty (Mittal, 2001 & Shah, 2001).

11.8.3.1 “Food for Peace” or “food for poverty”, Western donor impacts on food production and wildlife management in Laikipia, Kenya

The (American) Food for Peace (FFP) (Public Law, PL-480) program was established in the 1950s to get rid of unwanted farm surpluses, to build new markets for American products and to reward favored Third World regimes. Concerning Food for Peace, in

“The Economist February 2, 1985, ‘This dumping has allowed shortsighted local governments to keep the price of foodstuffs for the urban proletariat so cheap that native farmers are ruined, and dependence on imported foods become a drag on development.’ Farmers in many Third World nations don’t always have the clout that farmers have in developed nations. Many repressive Third World regimes, along with some international bureaucracies and political lobbies, owe their continued existence more to aid programs than to indigenous popular support” (Schoolland, 2002).

In 1990, the principal author, as Regional Environmental Advisor to USAID, was approached by Russell Clark³⁷⁸ who was then head of the London Rhodesia Company (LONHRO)’s agribusiness in Kenya. They had two ranches in the White Highlands of Laikipia. These game ranches were losing money based on tourism and cattle. Game cropping was allowed and there was an over-abundance of game, especially zebra – a bulk feeder, but a limited game meat market in Kenya. International veterinary restrictions prevented the sale of this game meat overseas.

Russell proposed bringing in a solar dryer from Japan, setting up a culling operation covering most of the Laikipia Ranches and establishing a distribution network, supplying a high quality protein source to refugee camps in Somalia, Sudan and Ethiopia. As Russell said, “We can show that Africa can feed Africa”. The USAID PL480 “Food for Peace” Kenya representative said that is very nice, but that we are here to subsidize American farmers, not to help “Africa Feed

³⁷⁸ Later an advisor to the Zambia Wildlife Authority.

Africa". End of story and so much for the idea that USAID was in Sub-Saharan Africa to help it become economically independent and to attain food security. In the case of wildlife in Kenya, wildlife could have been given a new value and could have helped Sub-Saharan Africa stand on its own two feet under a policy of food security, where wildlife as a land use can out produce grains in many low rainfall savannah areas of Kenya, allowing people to generate income to purchase food produced cheaper elsewhere. However, this went against U.S. national and foreign policy. It could have been orchestrated so easily with local currency that comes out of the PL 480 funds from purchasing this cheap food by the host country.

In FY 2002, USAID obligations for SSA totaled \$1.1 billion, of which USAID's assistance consisted of \$420 million for child survival and disease programs, \$466 million for development assistance programs, \$100 million in economic support funds and \$132 million for Public Law PL-480 (USITC, 2003) (see Section 11.7.1.1, Overseas Development Assistance [ODA] versus Overseas Assistance [OA] – U.S. Foreign Assistance).

Noam Chomsky (1999) explains that not only was Food for Peace (FFP) aid used to help subsidize American agribusinesses and shipping, but by undercutting local producers, was also a disincentive to produce some level of food security, the goal being to create dependency. This dependency served the political interests of America during the Cold War and would appear to serve its interests today, possibly as one tool among many of accessing Sub-Saharan Africa's natural resources as cheaply as possible. Interestingly, Chomsky (1999) argues that the use of Food for Peace aid destroyed Columbia, South America's wheat³⁷⁹ industry and was a major cause of small farmers turning to growing cocaine, ironically to service a growing drug culture in America.

³⁷⁹ The author believes this to be maize and not wheat?

11.8.4 Food Aid and Ujama'a Villages in Tanzania

With food aid to "cover-up" the most grievous results of their actions, Third World governments can pursue such counterproductive policies as forced collectivization and price controls on farm products. Tanzania's President Julius Nyerere was able to collectivize farms, "Ujama'a Villages" (translates: "pulling together"), and engage in massive relocations of peasants because food aid "hid" the consequences of such actions (Majewski, 2002). His idea was that African village life was essentially socialistic and by expanding this to a modern state, everyone would approach moderate wealth. Good ancestral land was abandoned in favor of moving peasants into crowded areas, where inputs failed to arrive in a timely manner and similar to the colonial tsetse concentration program under the British – the soils played out, crops did not reach market, abandoned cashew crops failed – the major source of revenue. As discussed in Chapter two, traditional African societies may have a communal structure, but they are made up of separate pockets of capitalism that amass wealth through such activities as crops and livestock, excelling at hunting, fishing, honey collection, in traditional medicine, blacksmithing, logging and charcoal making among others, and where leaders through custom and religion have a responsibility to their extended families. Nyerere's system put unaccountable politicians and bureaucrats in power, not traditional leaders, who interfered with the creation of wealth and made most people poorer. Those who worked supported those that did not, until no one worked (Rosenblum & Williamson, 1990). It is estimated that between 1973-76, about five million people were bullied into these model communal settlements, this concentration policy having already failed under the British [see Chapter 3, Section, 3.8.3, Land Compression and British Colonial Policy, Tanganyika (Tanzania) and Chapter 5, Section, 5.6.1.9, Failure of colonial groundnut scheme in Tanganyika (Tanzania)]. This experiment in socialism was

a failure, both ideologically and ecologically. Although the government, not the donors, took the initiative, the same techno-economic vision was shared until late in the game by the World Bank, USAID and other donors contributing to Tanzania's development (Sogge, 2002a).

11.8.5 EU Dumping of Milk and Meat

In "the semi-arid and sub-humid grazing systems, especially in West Africa, this dumping of meat and milk reduced off-take and increased grazing pressure. The recent devaluation of the CFA franc (from 50 CFA/1 French Franc to 100/1 in 1994) almost doubled off-take from the Sahelian herds, thus reducing grazing pressure, and almost eliminated the imports of dumped meat from the EU" (Vergriette & Rolland, 1994 *In: de Haan, Steinfield & Blackburn, 1997*).

However, devaluation of the CFA has had a devastating impact on wildlife in many countries, people turning to poaching as other segments of the economy collapse (see Section, 11.11.6 Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the "Dobi Dobi", More Parks and Protected Areas).

11.8.6 Food Aid and NGOs in Sudan

In mid-1998, Southern Sudan suffered its fourth major famine in ten years resulting in an estimated 70,000 – 100,000 deaths. Famine in Sudan reflects a long history of politically powerful groups exploiting their superior access to political power, including direct use of force, in order to extract economic benefits from politically weaker groups. The British annexation of South Sudan to North Sudan in 1947 is seen by many as the source of the ongoing turmoil and the underlying cause of recent famines (Deng, 1999 *In: Devereux, 2001 In: Devereux & Maxwell, 2001*).

Food aid has been used as a weapon by both sides (Meredith, 2004). Operation Lifeline Sudan has always recognized the government's authority, a fact that Khartoum often abuses to limit humanitarian response to parts of the country it does not control by vetoing food aid drops to specific towns and territories and introducing strict flight clearance rules. However, Operation Lifeline Sudan also works closely with the rebels in the south, in effect giving them some UN legitimacy. In 1995, the Sudan People's Liberation Army (SPLA) and a splinter rebel faction signed ground rules, brokered by Operation Lifeline Sudan, meant to ensure protection of civilians, accurate delivery of food aid and respect for children's rights. Some argue that by providing relief supplies it allows the warring sides to buy time, re-supply their forces and even maintain legitimacy in territories they control. The government accuses Operation Lifeline Sudan of backing the SPLA. The SPLA has also obstructed aid and attempted to use the delivery of food in the south for its political advantage. The SPLA has also regularly diverted food aid for military use (ICG, 2002). One food aid official admitted that he made deals with Garang, 10% of the food going to Garang and 90% to supposed refugees (Meredith, 2004). Madsen (1999) speculates that USAID, with strong ties to the CIA/Intelligence community, used the old CIA Airline, Southern Air, to funnel both arms and food aid to the SPLA through Western NGOs.

During the principal author's stay in Nairobi with USAID from 1990-1992, an ex-Peace Corps friend, Dale Skoric (*pers. comm.*)³⁸⁰ from Cody Wyoming, worked in Nasir, southern Sudan, on a program coordinated by the World Food Program (WFP). This was the headquarters for Riek Machar, the Nuer SPLA leader (in 2007, Vice President of Southern Sudan), who switched allegiances a couple of times between the SPLA head John Garang (a Dinka) and the Khartoum Government. At the time, he was allied to the SPLA. It was common knowledge

³⁸⁰ In 2006, Food for Peace Officer, USAID, Washington, D.C.

among the food aid fraternity that Riek kept the refugees in camp and that a portion of all food aid went to feeding his army. Dale explained a number of times, that if left to their own means, the Nuer herdsmen could have dispersed into the bush and done quite well on their own. The food aid fraternity knew very well that their support was going to feed an army and that the refugee camp was artificial. However, rather than rock the boat, in order to keep the food and their “lavish lifestyles” in Nairobi flowing and likely to support the geo-political agenda of the U.S./West, the status quo was tolerated (see, Chapter 13, Section, 13.10.1.6, Oil-scorched earth Sudan). Similar use of people by “warlords” as human bait is said to have occurred in Somalia in the 1980s and Eastern Zaire (see Chapter 13, Section, 13.8.6, Former Cold War allies vying for power in the Great Lakes Region) in the 1990s as proof of humanitarian need (Sogge, 2002a).

11.8.7 Food Aid and War in Somalia

In Somalia in 1986, the army and militias took more than 80% of the food aid. Sometimes military and commercial interests coincide, such as in garrison towns in Sudan, Eritrea and Somalia (Devereux, 2001 *In: Devereux & Maxwell, 2001*). Jan Westcott, a USAID food aid employee, and Trevor Walker a British/Kenyan (*pers. comm.*)³⁸¹, both working in Somalia, expressed similar opinions of food aid jokingly saying, “we are feeding the Somalis to fight another day”. More recently, Ostheimer (2000) states,

“by feeding the population (through foreign food aid), resources are freed up for the warring factions”.

11.8.8 Food Aid and Impacts on Grain Production in Southern Africa

³⁸¹ Jan Westcott and Trevor Walker, Food Aid Workers, Living in Kenya and delivering to Somalia, 1990-1992. Ms. Westcott believed to be back in USA and Trevor Walker resides on the Athi Plains, Nairobi. His son Alex was a professional hunter with Miombo Safaris, Tanzania and runs a photographic safari operation in Kenya, “Serian Maasai Mara”, www.serian.net.

A combination of drought, floods and radical land reform in Zimbabwe resulted in an influx of Western food aid in 2002. Food aid is killing commercial businesses in the region. An intentional over-estimation of food aid by the World Food Program (WFP), as a means of attracting food aid, raised maize prices to over R2,000/ton based on supply and demand. In a similar response to the Laikipia case study above,

“In an effort to allow Africa to feed Africa, the World Food Program (WFP) was approached to rather buy processed products from South Africa - which had a surplus at that time - to supply to these countries in despair. Response from the donor community was ‘we don’t give money, we give product’ - surplus product” (de Villiers, 2004).

Because of free food, “food aid” and a stronger Rand, exports of wheat flour and maize meal from South Africa to the region, halved in 2003. So much food aid is going to Lesotho and Swaziland that grain mills must sell their product outside these countries, as the local market is saturated with food aid. Similarly, Zambian farmers have no internal market because of food aid (de Villiers, 2004).

“Food aid in these countries at uncontrollable quantities has a negative impact on both commercial businesses, including feed millers, the milling industry, retail and others, and farmers to such an extent that they are struggling to survive during this time. Food aid internationally is on a downward trend, but the percentage supplied to Sub-Saharan Africa is increasing. According to the International Grains Council in 2000, Sub-Saharan Africa received only 17% of the total food aid supplied, but in 2002 it increased to 35%” (de Villiers, 2004).

The quality of the donated food aid is also questionable.

“The South Africa milling industry experienced difficulty in processing the yellow maize for Lesotho that was donated by the

United States due to very high moisture levels and high screenings. Some of the wheat donated to Zimbabwe contained toxic levels that were up to 15 times higher than that of the South African standard” (de Villiers, 2004).

High moisture levels can set the conditions for carcinogenic aflatoxins “toxic levels” created by mold (see Chapter 5, Section 5.6.3.2, Foreign assistance in Sahel goes for large scale as opposed to improving traditional agriculture - Cold War Politics and Western Donor Impacts On Food Production, Senegal).

It also appears that donated food, as the principal author has seen all over Sub-Saharan Africa, is finding its way into retail stores along the trucking route between South Africa and Zimbabwe, in essence food aid competing with the local farmer and local processors (de Villiers, 2004). In the long run, the danger is southern Africa’s farmers and agro-industries could be put out of business and become permanently dependent on food aid from overseas. This is dangerous for a number of reasons: 1) With a population doubling in 50 years and a past history of global grain deficits since 2000,³⁸² can southern/Sub-Saharan African count on the rest of the world feeding it in the long run, 2) global production of ethanol could also result in less grains available for food aid (see Chapter 5, Section 5.3.1.2 Keeping up with future demand – global deficits of the 21st century and Chapter 13, Section 13.7.2, Western Foreign Policy and Multi-Nationals Exploiting Africa), and 3) Once food aid dependent, food aid becomes a political tool to control and manipulate everything from a country’s vote in the UN to pricing raw products in the interest of the importing country – in other words, South Africa begins losing control of its sovereignty, the end game in foreign aid as it slides further into a permanent state of welfare.

³⁸² For the first time in four years, with bumper maize production in the USA and wheat in Europe in 2004/2005 being projected by the FAO, cereal production should meet global demand, offsetting the need to draw down global grains stocks for at least one year (see Chapter 5, Section 5.3.1.2, Keeping up with future demand – global deficits of the 21st century).

J. F. de Villiers of the South Africa National Chamber of Milling, pleads to the international donor community,

“South Africa would like to thank the food aid fraternity for its involvement and supplies to people in distress, but also urgently call on the international community not to deny us the right to produce and develop commercial business and thereby develop our region to become globally competitive” (de Villiers, 2004).

Some U.S.-based charities are heeding this call. Doctor Helene Gayle, the president of the U.S.-based charity CARE has turned down US\$ 45 million in U.S. Government food aid, stating that “it floods local markets with cheap imported crops, which local farmers cannot compete with”. One change some aid groups advocate is to amend U.S. law, allowing them to purchase more locally produced products in recipient countries, instead of importing from the U.S. The ultimate goal is to build sustainable local economies, provide food more efficiently for emergencies, or food for people who are in need (Besheer, 2007).

11.9 THE NEW SAVIORS OF SUB-SAHARAN AFRICA; NGOs

“International conservation planners [now] stress the need to ‘empower’ local people. This form of paternalism seems to be an entrenched feature of Third World development and humanitarian aid projects, which are typically planned and implemented by highly educated middle-class Westerners. The project planners and managers generally maintain (or improve) their own lifestyles, while displaying attitudes that seem to be colored both by colonial-style paternalism toward people they regard as the benighted peasants of the Third World, and by guilt for the perceived wrongdoing of their colonial antecedents. This pursuit of a mixture of material and sociopolitical aims has become endemic in Third World conservation projects initiated by Westerners and, as I have argued, has its roots in the liaison that developed in the 1970s between international conservation and development organizations” (Oates, 1999 *In: Nelson, 2003a*).

In recent times, much foreign aid has been directed through NGOs as the “flavor of the month”. With the waning of the Cold War, there was a reduced need to worry about the takeover of the African subcontinent by communist ideologies. In the 1990s, Western donors began to sour on the progress governments were making in the development arena, even though many of their very own policies imposed on Sub-Saharan African countries (e.g., Structural Adjustment [SAP], supporting despots and corruption by the political elite as long as they kept the communist presence off the subcontinent) affected development performance. They began channeling much of their money through Non-Governmental Organizations (NGOs). Manji and O’Coill (2005) place the emergence of NGOs in Sub-Saharan Africa in the 1990s from Western donors funneling money through them to ensure a so-called safety net of social services taken away by structural adjustment (see Chapter 12, Section 12.3, STRUCTURAL ADJUSTMENT, IMF AND THE WORLD BANK and Section 12.4, STRUCTURAL ADJUSTMENT FOOD PRODUCTION AND LAND/RESOURCE DEGRADATION IN SUB-SAHARAN AFRICA). In 1992, NGOs distributed 10-15% of all aid transfers to developing countries. The U.S. government channels 40% of official funding through NGOs. It is estimated that 75% of aid money is spent on administration (Manji & O’Coill, 2005) (e.g. overhead and salaries of NGOs and consulting firms), implying that only 25% goes to so-called development. Aid and also NGOs can also draw critically needed talent away from governments,

“Aid can also damage the economy through inflation. Higher wages in the NGO sector can cause competent civil servants to leave government to work for foreign agencies or cause others to seek to achieve similar standards of living through corruption” (Transparency International, 2005a).

Most of the NGOs are based out of the West, most often from the country of the donor supplying the development and today, conservation funds. Even local

NGOs are often affiliated with foreign NGOs and/or heavily influenced by the politics and visions of the Western donors providing their funding. Their overheads are often lower than the “Beltway Bandit” consulting firms, but it is simple - both international and local – NGOs and consulting firms, like governments and donors, are not entrepreneurial. They spend money. They do not generate wealth from Africa’s resources, nor do they know how to help rural African’s do the same. Very often they are organized by donor agencies or spring up as entrepreneurial ventures (for the few NGO employees) to meet donor specifications. Very often, grass roots organizations, once member/stakeholder driven, become donor driven as they begin living off donor funds. For citizens and local communities, development choices and initiatives end up in the hands of foreigners or local actors with little or no accountability to public authority, creating a tyranny of structurelessness with little or no coherence (Sogge, 2002a). Thus, northern and even local NGOs proliferated, becoming functional parallel states (Zack-Williams, 2002 *In: Zack-Williams, et al., 2002*) within states. The idea that donor-dependent, ideologically diverse NGOs can stand in for a mass democratic movement is ludicrous (Bond & Manyanya, 2003).

Willsea (2003) refuses to list NGOs that take U.S. government funds, as possible alternatives to the U.S. Peace Corps, since concern exists that these NGOs become intrusive instruments of U.S. foreign policy with continued hegemony over and exploitation of the developing world. This would also be true of NGOs linked to other bilateral and multilateral donors.

The explosion in number of NGOs in the 1990s is not a reflection of a flowering civil society, but evidence of adaptation by Sub-Saharan African political actors to the changing complexion of the international aid agenda. NGOs have become the new structures for Sub-Saharan Africans to establish an instrumentally profitable position within the existing system of neo-paternalism, taking

advantage of the new rules established by the international aid market. Far from strengthening civil society, NGOs are hijacking genuinely needed development aid. NGOs spend an excessive proportion of their budget on furnishing their members with sophisticated and expensive equipment (e.g., 4x4 vehicles, computers, salaries, *per diems*, world travel to conferences and workshops), leaving too little for development. Corruption and neo-patrimonial relations are brought from the central to local level (Chabal & Daloz, 1999) with little or no change in the average person's life. As beneficiaries, rather than asking for an overhaul of foreign aid, these NGOs press for more (Sogge, 2002a). Sankore (2005) sees NGOs as part of the long-term problem, while they purport to provide short-term solutions to economies and development. Child, B. (2004b *In:* Child, B., 2004a) explains that the urbanized political elite that control conservation policies, through conservation NGOs, prefer to spend a disproportionate amount of resources on conferences, which they attend, leading to more conferences.

From the authors' experiences, NGOs often strategically place themselves between the rural communities and their resources, serving as another layer of bureaucracy that impedes rural Sub-Saharan Africans from freely accessing, managing and having the right to reap the benefits from sustainable management of these resources. They make themselves indispensable and often jockey for power over who controls certain countries or geographical areas within a country for donor funding. For instance, the principal author personally witnessed a turf struggle by the World Wildlife Fund (WWF)³⁸³ and the Wildlife Conservation Society (WCS)³⁸⁴ over conservation and associated donor funds in Southeastern Cameroon. WWF won out, while just across the Sangha River, WCS controls the conservation turf in Congo Brazzaville, while they both appear to share territory in the same region of the Central African Republic (CAR/RCA), having created

³⁸³ WWF International, Avenue du Mont Blanc, CH 1196 Gland, Switzerland, Tel: +41 22 364 9111, <http://www.panda.org/>.

³⁸⁴ Wildlife Conservation Society, New York, USA, <http://www.wcs.org/>.

mini-states within states in which researchers are kings and rural communities their surfs (see Section, 11.11.6 Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the “Dobi Dobi”, More Parks and Protected Areas & Section 11.11.7, Case study Bongo in the Congo (Brazzaville) concerning WCS).

The general attitude of the NGOs, governments and donors is that rural Africans are incapable of managing their resources, that if tomorrow they were handed over, rural Africans would mine the resources for short-term gains. Likewise, NGOs are afraid of the private sector, which has the potential to employ its own development personnel, eliminating the need for these NGOs. Meanwhile, other than workshops, little effort is made to provide practical exposure to the market place (e.g., taking selected rural community members to international trade shows), or the tertiary level of education needed to allow communities to stand on their own two feet, manage and market their own resources and develop their own financial independence. Thus, the NGOs, governments and Beltway Bandits are a form of neo-colonialists who keep rural Africans poor, dependent and serve as a layer or barrier between rural resource users and access to their resources.

11.10 FOREIGN AID AND THE ENVIRONMENT

“...money does not automatically unlock rural development...millions of dollars have been wasted across Southern Africa in projects that have mostly just provided income for their designers and administrators...The flip side of this gross inefficiency in the use of development budgets has been the irreverent argument that it would be much simpler just to hand the money out to the rural poor rather than spending it on projects that go nowhere. The development industry has never taken that argument seriously” (Turner, 2004 *In: Fabricius, Koch, Magome & Turner, 2004*).

11.10.1 Foreign Aid for “Conservation”?

Colchester (1994; 2003) cites important international laws/proposed laws concerning the rights of indigenous people³⁸⁵ (e.g., Pygmies, San, Dozo, Maasai and other traditional cultures) over their land and resources:

- Draft of the Universal Declaration on the Rights of Indigenous Peoples, Article 3, being developed by the UN's Human Rights Commission, notes: “Indigenous Peoples have the right to self-determination. By virtue of that right, they freely determine their political status and freely pursue their economic, social and cultural development” (United Nations, 1993 *In: Colchester*, 1994; 2003).
- Draft of the Universal Declaration on the Rights of Indigenous Peoples, Article 26 States: “‘Indigenous peoples have the right to own, develop, control and use the lands and territories, including the total environment of the lands, air, waters, coastal seas, sea-ice, flora and fauna and other resources which they have traditionally owned or otherwise occupied or used. This includes the right to the full recognition of their laws, traditions and customs, land-tenure systems and institutions for the development and management of resources, and the right to effective measures by States to prevent any interference with, alienation of or encroachment on these rights’” (United Nations, 1993 *In: Colchester*, 1994; 2003).
- Article 11 of International Labor Organization (ILO) Convention 107 of 1957 states: “‘The right of ownership, collective or individual, of the members of the populations concerned over the lands which these populations traditionally occupy shall be recognized’” (ILO 1957 *In: Colchester*, 1994; 2003). This includes the right to equal compensation if removed from their traditional areas, “as an exceptional measure” (ILO 1957 *In: Colchester*, 1994; 2003).
- Revised 1989 ILO Convention, Article 14 concerning nomadic people and shifting cultivators, “‘measures shall be taken in

³⁸⁵ “World Bank identifies as indigenous peoples 'social groups with a social and cultural identity distinct from the dominant society that makes them vulnerable to being disadvantaged by the development process'" (both Colchester, 1994; 2003). The most recent World Bank (2006) definition is that "...Indigenous Peoples are frequently among the most marginalized and vulnerable segments of the population. As a result, their economic, social, and legal status often limits their capacity to defend their interests in and rights to lands, territories, and other productive resources, and/or restricts their ability to participate in and benefit from development". "The International Labor Organisation (ILO), whose Conventions treat both indigenous and tribal peoples, place more emphasis on the notion of prior residence in an area, before conquest, colonization or the establishment of present state boundaries" (Colchester, 1994).

appropriate cases to safeguard the right of the peoples concerned to use lands not exclusively occupied by them, but to which they have traditionally had access for their subsistence and traditional activities. Particular attention shall be paid to the situation of nomadic peoples and shifting cultivators in this respect' " (ILO, 1989 *In: Colchester, 1994; 2003*). This would include hunter gatherers.

- Revised 1989 ILO Convention, Article 15, " 'The rights of these peoples concerned to the natural resources pertaining to their lands shall be specifically safeguarded. These rights include the right of these people to participate in the use, management and conservation of these resources' " (ILO, 1989 *In: Colchester, 1994; 2003*).
- ILO Convention 169, in Articles 2 & 4 over the need to respect and safeguard indigenous peoples' customs and institutions, while Article 6 obliges States to: " 'a) consult the peoples concerned, through appropriate procedures and in particular through their representative institutions, whenever consideration is being given to legislative or administrative measures which may affect them directly...c) establish means for the full development of the peoples' own institutions and initiatives, and in appropriate cases provide the necessary resources for this purpose' " (ILO, 1989 *In: Colchester, 1994; Colchester, 2003*).

The IUCN position on indigenous rights with regards to parks, forests, marine and coastal resources, biodiversity and intellectual property rights and oil/mineral rights is linked to ILO Convention 169 (Colchester, 2003).

The following discussions and case studies will demonstrate that these laws are violated daily by international donors, conservation NGOs, Sub-Saharan African governments and their private sector partners in the creation of parks, hunting blocks and other forms of protected areas. The voices of the rural poor go unheeded.

It can be argued that only in Sub-Saharan Africa have peasants, up until now, been able to escape capture by other classes by controlling the means of production. Thus, for many rural Africans "development projects" have been an arm of the government to subdue them, undermining the diversity of resources

(Rosenblum & Williamson, 1990) they need to survive and which often makes their traditional management systems and technologies obsolete. In fact, most development strategies have failed Sub-Saharan Africa to date: 1) Import substitution in the 1960s-1970s, 2) integrated rural development in the 1970s-1980s and 3) Structural adjustment [SAP] from the 1980s to present (Alemayehu, 2000).

In the late 1980s and early 1990s, private foundations, multi- and bilateral donor agencies strongly supported the concept of involving communities in conservation, what was then in vogue: the concept of sustainable development (Chapin, 2004).

In Sub-Saharan Africa, urban-based conservationists and development planners with fixed agendas associated with NGOs and donors, come into rural communities imposing on them demands which, in their eyes, are often inexplicable and unfair. Who should set conservation policy? How should local conservation needs fit into national and global priorities (Adams, 2003 *In: Adams & Mulligan, 2003*)? In most cases it is certainly not rural people making these decisions (see Chapter 9, Section 9.4.2, The Social Equity Strand). This is comparable to donor funded agricultural schemes where local residents are not partners or clients, but a means of production who are denied control over their lives (Sogge, 2002a). In conservation areas, it can be argued that rural people and their needs are secondary to wildlife, maybe even irrelevant.

However, "...environmental protection is often seen as anti-human and a continuation of colonial policies" by local communities (Giles-Vernick, 1999 *In: Maddox, 2002 In: Dovers, Edgecombe & Guest, 2002*).

The preservationist attitude of many Western donors and NGOs is the outcome of societies that have destroyed their large and dangerous wildlife and who are relatively divorced from the natural world (Duffy, 2000). At the same time, Sub-Saharan African governments and local communities detect hypocrisy by Western governments, international organizations and NGOs, especially the World Bank, for simultaneously promoting environmental protection and the exploitation of more resources in the developing world by multi-national corporations (Maddox, 2002 *In: Dovers, et al.*, 2002).

“What is more, such states (both Western and Sub-Saharan African governments) have often proved more responsive to powerful international conservation lobbies which do not always take indigenous needs into account” (MacKenzie, 1997 *In: Griffiths & Robin, 1997*).

In principle, the two concepts can go hand in hand, that is areas set aside for parks, possibly serving as core areas that are surrounded by multiple use conservation areas, such as for logging, hunting and fishing. In principle this sounds fine, but in many instances, as these case studies will demonstrate, the resources are being plundered, local people are not really being empowered to manage and benefit from their wildlife and other resources and most importantly, Westerners, with their urban bias towards what wildlife should be, are imposing their images of African wildlife landscapes on other cultures, using backing from foreign donors. The net result alienates and separates local people from their resources to the benefit of timber companies, safari/tourism operators and white tourist elite (both hunters and game viewers), with a minimum return to the local people when this income is divided at the level of the household (see Chapter 9, Section 9.7.6.4, CBNRM will not create a “middleclass” in rural Africa). In many cases, cultures have and are being destroyed by this approach to conservation, a form of eco-genocide (see also Chapter 9 on CBNRM).

11.10.2 Negative Impacts of EU Foreign Aid on the Environment and Traditional Cultures

“Third World projects funded under the European Union (EU)’s aid program and administered by the European Commission (EC) are:

- Wrecking the environment of developing countries, including threatening globally important tropical rainforests and destroying local communities;
- Breaching the European Commission’s own guidelines and procedures meant to protect the environment and vulnerable people; and
- Operating behind a ‘veil of secrecy,’ such that members of the public and even European governments are unable to obtain key information on the use of EU money on Third World schemes.

European Commission (EC) projects have led to the eviction of communities from traditional forest lands in Uganda, increased hunting, logging and poaching in Cameroonian forests as a result of road construction from Lomié to Ampiel along the Dja Game Reserve (Southeastern Cameroon), which negatively impacts Baka Pygmies who were never consulted. In addition, poor policies have added pressure on forests in Nigeria and Ghana” (De Sarkar, 1998) (see Section 11.11.6.13, Let the Pygmies be the guardians of the forest).

Although some would argue that there is not much to a Pygmy village, Peterson (2003) gives an example of an entire Pygmy village being bulldozed by a logging company, apparently with little or no consultation, in order to build a sawmill. This is likely one of many atrocities resulting in social upheaval committed in the name of progress in and around the Dja Biosphere Reserve, receiving European Union (EU) funding both in and outside the reserve. Betti (2004) explains that logging³⁸⁶ around the Dja Biosphere Reserve “constitutes a serious problem due

³⁸⁶ Eight logging companies extracted 157,429 m³ of wood have in the “North and the South of the Dja Biosphere Reserve from 2000 to 2003. *Erythrophleum suaveolens* (18,08% of the total volume of all species), *Distemonanthus benthamianus* (13,67%), *Baillonella toxisperma* (11,76%)

to the reduction of wild fruits such as moabi (*Baillonella toxisperma*) for local people and large mammals and due to the intensification of commercial hunting” as well as a decrease in wild medicines.³⁸⁷ The over-harvesting of mammals that act to aid in the germination and distribution of plants [e.g., *Strychnos campagneura* (Loganiaceae) or *Tetrapleura tetraptera* (Mimosaceae) that are scattered by elephant], can have a major impact on floral diversity. More than 70% of the plant species logged in the Dja region are scattered mostly by animals.

11.10. 3 Creation of Powerful Conservation NGOs by Western Donors

“Conservation organizations have traditionally derived their funding from the establishment and have sought to impose their visions through the power of the State. Globalizing conservation only strengthens this tendency” (Colchester, 1994).

Just prior to moving to Senegal as an environmental advisor to the Gambia River Basin Development Organization/*Organisation pour la Mise en Valeur du Fleuve Gambie* (OMVG) in 1982, the U.S. Agency for International Development (USAID),³⁸⁸ who had contracted the principal author, requested him to visit the African Wildlife Foundation (AWF)³⁸⁹ headquarters, a little office above Dupont Circle with an ex-ambassador and a secretary. Raymond Bonner’s book (1993), *At The Hands Of Man* explains how AWF was started by hunters and infiltrated and taken over by non-hunting staff. At the time, World Wide Fund For Nature

and *Milicia excelsa* (11,10%) appear to be the most important trees extracted according to the percentage of the volume exploited” (Betti, 2004).

³⁸⁷ For example, according to the Baka women, “motoko-toko (*Picralima nitida*) is at least twice as strong as chloroquine against malaria, and the ma’ a polo (*Chenopodium ambrosioides*) has a similarly stronger potency than “vermox” against intestinal worms”, *Baillonella toxisperma* (Sapotaceae) or “Mabé” in treatment of lumbago, *Nauclea diderrichii* (Rubiaceae) or Mossé à yooli is for treating malaria/fever (Betti, 2004).

³⁸⁸ USAID, Ronald Reagan Building, Washington, D.C. 20523-1000, Tel: 202-712-0000 Fax: (202) 216-3524, <http://www.usaid.gov/>.

³⁸⁹ African Wildlife Foundation, 1400 Sixteenth Street, N.W., Suite 120, Washington, D.C. 20036, U.S.A., Tel: +1 202 939 3333, Fax: +1 202 939 3332, email: africanwildlife@awf.org, <http://www.awf.org/>.

(WWF)/USA was basically a one-man show - Michael Wright. Look what they are today – both multi-million dollar corporations made by the donors. For instance,

“from 1990 through 2001, USAID provided a total of roughly \$270 million to NGOs, universities, and private institutions for conservation activities. The lion’s share of this amount destined for NGOs was harvested by WWF,³⁹⁰ which received approximately 45% of the available money. A small yet significant portion of the total budget for conservation goes to just five other NGOs—Conservation International (CI),³⁹¹ The Nature Conservancy (TNC),³⁹² Wildlife Conservation Society (WCS),³⁹³ the African Wildlife Foundation (AWF), and Enterprise Works³⁹⁴—through the Agency’s Global Conservation Program” (Chapin, 2004).

Depending on the individual, in some places they are doing some good, as with Chris Weaver of WWF/USA in Namibia on the LIFE Project, or WWF/Zimbabwe supporting CAMPFIRE. In many cases, as in East Africa (see Chapter 9, Section 9.6.3.6, SCP, Tanzania concerning AWF around Tarangire National Park) and Congo Brazzaville [see Section 11.11.7, Case study Bongo in the Congo (Brazzaville) concerning WCS], what do these NGOs have to show for accomplishments, especially among the rural people and their resources? There may be some nice research papers presented at seminars coming from these conservation NGOs, but the average person’s life in the rural areas where they have planted their flags is far from being improved as a result of their

interventions. Indigenous communities have never been given the opportunity to design and implement their own programs with Western conservation NGOs controlling the money and calling the shots;

“scientists doing God’s work...a divine mission to save the earth”
 (Chapin, 2004).

Agendas are often different, with rural communities wanting to live off the land without destroying the resources, while the conservation NGOs feel a need to establish protected areas off limits to the local people (Chapin, 2004). In essence, most conservation NGOs talk community, but act neo-colonial. Most should be called preservation NGOs.

Conservation NGOs and consultants know where their bread is buttered, responding more to the politics of the donors than to the needs of indigenous peoples.

“Highly motivated conservationist consultants come to occupy the political space within the State that indigenous representatives have been striving to enter themselves, while at the same time, the conservation institutions, bidding for lucrative consultancies and protected area ‘projects’, adjust their management style to the exigencies of the international agencies that fund them rather than the indigenous communities whose territories they are seeking to conserve. While substantial conservation budgets are lavished on satellite mapping systems, helicopters, jeeps, offices and official salaries, indigenous peoples are increasingly marginalized from decision-making” (Colchester, 1994).

11.10.4 Conservation and Development Work-Shopped Instead of Actually Being Undertaken

The other phenomena which began to evolve in the late 1980s was that development and conservation became one big continuous “Workshop” in which

people meet to talk about development and conservation, with little or no money going to conservation. Nice reports are produced. Many African bureaucrats are out of their offices traveling to workshops and conferences, as “*Per Diem Trips*” that gain them a better income than their actual salary.

Meanwhile, in the case of natural resources, the wildlife and its habitat suffers under a wave of human poverty and misery, which development and conservation fail to alleviate – often exacerbating the problem - with little happening on the ground to address the real issues. This is believed to be a “disease” symptomatic of the “Communication Age” where talk and conceptualizing on emails become more important than actualization. The world seems to be forgetting that conservation must take place in the field with the people using the resources. Ironically, the then Director of Wildlife³⁹⁵ for Cameroon at the regional Southeastern Cameroon Elephant Workshop of May 2000, which the principal author attended, told the NGOs, “it’s about time you stop driving around in your air-conditioned land cruisers, get out and start doing something”. At the time, the Director did not even have a 4x4 for his own use in the field, while the NGOs were “donor” equipped with the latest in technologies and paraphernalia.

11.10.5 Conservation NGOs Consume Money, They Do Not Generate Wealth

“ ‘If you were to base your ideas about the state of the natural world on what the major conservation organizations (NGOs) say, in their magazines, public pronouncements, annual reports, basic advertising, and so on, you would develop the comforting sense that the natural world, although certainly stressed by many very

³⁹⁵ Denis Koulagna, MINEF, Yaoundé, Cameroon.

serious problems, is nevertheless in the hands of good people who are going to save it...the positive message...the sort of thing likely to motivate you to clip out the coupon...your contribution to the future of the planet...thanks to you and other right-minded people...But why, then, when you read the newspapers, or when you actually look for yourself, travel to one of the critical spots of biodiversity, do you find that things are actually getting worse...Why are you led to believe that the world's great wealth of biodiversity is being saved, when in so many places you can see for yourself that it is seriously on the decline' (Photographer Karl Ammann *In:* Peterson, 2003)...Karl believes, mainstream conservation organizations...have become professional purveyors of environmental pabulum, seldom challenging the expectations, knowledge, or sympathies of their target audience, and thus ultimately promoting what he has come to identify as 'feel good conservation'...institutional conservation has decided that the public back home simply cannot bear very much reality" (Peterson, 2003).

Most conservation NGOs spend money, their programs depending upon continual infusions of funds from outside sources. For instance, the top seven executives of Wildlife Conservation Society (WCS) earned a total of more than US\$ 2.6 million in the year 2000 (Peterson, 2003). Fairhead and Leach (2003) demonstrate how in Guinea-Conakry, NGOs, various levels of government officials and even villagers *per diems* and transport depend upon donor money. Elaborate bureaucratic processes are required in order to become established as a community body (e.g., Forestry Group) able to legally exploit resources. Western donors pay various levels of bureaucrats for signing off on elaborate management plans. Donors pay NGOs to develop these plans and provide oversight. It is in the financial interest of the NGOs to create more paperwork and even more complex procedures, as a means of expanding their work, justifying their existence and creating a permanent need for their services. NGOs become another level of bureaucracy between rural communities and their resources, indirectly living off communities through donor funding and often through failed integrated rural development schemes that continually cut off rural communities from accessing and

sustainably managing their natural resources in favor of “farmed resources” (e.g., fish culture, agro-forestry, farming cane rats and growing herbal medicines) Although they claim to support devolution, their economic interests promote more state intrusion. These NGOs have no entrepreneurial side to them. They do not generate wealth from Sub-Saharan Africa’s resources. This is the role of the private sector, ideally community-owned companies or partnerships, as a means of assuring a fair share of the wealth generated from resources staying with the community. Fairhead and Leach (2003) observed major tensions between rural communities and many NGOs, seeing them as being linked to an extension of a predatory non-representative state and its intrusiveness on their lives.

Most NGO conservation programs are not sustainable without donor funds. Unfortunately, since they control foreign aid in Sub-Saharan Africa’s conservation arena, they call the shots when it comes to conservation policy in SSA countries. Since they do not depend on the wildlife resource and the wealth generated from it to survive, they can afford to tie up the resource by applying preservationist/precautionary principles while living off donor handouts. This is usually at the expense of the wildlife and the rural poor living among the wildlife. In trying to survive, the rural poor opt for other land uses, wiping out both wildlife and their critical habitat, often poaching for short-term gains.

11.10.6 Eco-Colonialism - Conservation Driven by Researchers as Opposed to Wildlife/Natural Resource Managers

“It is the way people work with nature rather than the way nature works that will ultimately determine the future of conservation. Hence our suggestion that it is more productive to use political economics and market failure rather than ecological diversity as

the analytical frame to address conservation" (Child, B, 2004b *In:* Child, B. 2004a).

"It's no secret that millions of native peoples around the world have been pushed off their land to make room for big oil, big metal, big timber, and big agriculture. But few people realize that the same thing has happened for a much nobler cause: land and wildlife conservation. Today the list of culture-wrecking institutions put forth by tribal leaders on almost every continent includes not only Shell, Texaco, Freeport, and Bechtel, but also more surprising names like Conservation International (CI), The Nature Conservancy (TNC), the World Wildlife Fund (WWF), and the Wildlife Conservation Society (WCS). Even the more culturally sensitive World Conservation Union (IUCN) might get a mention...Financial support for international conservation has in recent years expanded well beyond the individuals and family foundations that seeded the movement to include very large foundations like Ford, MacArthur, and Gordon and Betty Moore, as well as the World Bank, its Global Environment Facility (GEF), foreign governments, USAID, a host of bilateral and multilateral banks, and Transnational Corporations (TNCs). During the 1990s USAID alone pumped almost \$300 million into the international conservation movement, which it had come to regard as a vital adjunct to economic prosperity. The five largest conservation organizations (or BINGOS/Big conservation NGOs), CI, TNC, and WWF among them, absorbed over 70% of that expenditure" (Dowie, 2005).

"The death blow of a nature reserve is not a figure of speech. It is not a metaphor for social disintegration and collapsing values. Dispossession threatens their livelihood and therefore their lives", (John Marshall³⁹⁶ & Olga Levinson³⁹⁷ *In:* Rosenblum & Williamson, 1987). "Whatever anyone outside Africa decides, neither wild animals nor land will be conserved unless Africans decide it is in their interest to do it...Animals will never be treated well if humans are treated badly" (Rosenblum & Williamson, 1987).

³⁹⁶ Author, researcher and filmmaker on Bushmen of Namibia

³⁹⁷ Author on books about Namibia such as Story of Namibia, South West Africa and The ageless land: The Story of South West Africa

This still holds true in the 21st century for many indigenous people, as pressure from the West has accelerated the expansion of parks and protected areas across Sub-Saharan Africa, ignoring their traditional ties to the land and nature resources, both for survival and cultural purposes.

11.10.6.1 Urban preservation philosophy imposed on rural Africans

“Increasingly, as wildlife has been perceived by urban viewers as '*choses à penser*' rather than '*choses à manger*', [footnote: 'things to think about' rather than 'things to eat'] the focus of much conservation has been on what have come to be known as the 'charismatic mega-fauna' - big spectacular animals of widespread popular appeal. Conservation of these species has absorbed the lion's share of the conservation budget” (Colchester, 1994).

“ ‘The concept of wilderness as the untouched or untamed land is mostly an urban perception, the view of people who are far removed from the natural environment they depend on for raw resources. The inhabitants of rural areas have different views of the areas that urbanites designate as wilderness, and they base their land-use and resource management practices on these alternative visions. Indigenous groups in the tropics, for example, do not consider the tropical forest environment to be wild; it is their home.’ ” (Gomez-Pompa & Kaus, 1992 *In: Colchester, 1994*).

A Western “urban” environmental consciousness emerged out of the 1970s with a realization that the West’s achievements in its technological and material advancements had been at the cost of polluted rivers and streams and acid rain among others (see Chapter 7, Section 7.8.2.1, History of environmental planning in America).

“As ecological awareness has grown, the focus has also shifted from the conservation of species (so-called alpha conservation) to the conservation of habitat (so-called beta conservation), a shift reflected in the change of name of one the largest conservation organizations, the World Wildlife Fund (WWF), to the WorldWide

Fund for Nature. Special measures to protect areas of intense species endemism have led to the development of a third kind of conservation (referred to as gamma conservation)" (Huber, 1993 *In: Colchester, 1994*).

In much of Sub-Saharan Africa, these concepts of conserving mega-fauna and biodiversity, linked to conservation and development, have been fused into the creation of mega-areas called Transfrontier Conservation Areas (TFCAs), disenfranchising people on an even grander scale [see Section 11.11.5, Transfrontier Conservation Areas (TFCAs), Southern Africa]. Protected areas, both large and small, terrestrial or marine, remain a priority for many international donor agencies as the most practical way of conserving the greatest amount of biodiversity (Colchester, 1994).

Linked to this environmental awareness, Western donors became increasingly frustrated over the failure of government-to-government loans and grants for state led development, while at the same time there was growing concern that the failure to develop was placing tremendous pressures on rural Sub-Saharan Africa's natural systems and their resources. Western conservation and food relief NGOs were "Johnny's on the Spot" and were bolstered by foreign aid to find the solution for Sub-Saharan Africa's environmental degradation (see Section 11.10.6.2 "Conservation and development" a continuation of failed "integrated rural development" linked to "preservation").

Because these NGOs live off international donor money, they have a major influence on parks and protected area policies. In many cases, one would think that many parks and protected areas are run by these NGOs and not governments and that these areas are for researchers and foreign tourists, not local Africans. As Barrow, Gichohi, and Infield (2000) explain,

“Many NGOs have 'taken over a park' for the purpose of supporting community conservation work”.

Ogwang and DeGeorges (1992) observed in Uganda, but this applies across the board in Sub-Saharan Africa where Western researchers “plant their flag” and create their empires that

“In the February 1992 Kibale Forest Buffer Zone Conference hosted by the PVO-NGO/NRMS Project (funded by USAID), there was concern raised that rather than being managed with a common set of objectives, each park in Uganda tends to be controlled by a given conservation NGO with its own agenda as to what a park should become (Tukahirwa, *pers. comm.* In: Ogwang & DeGeorges, 1992).³⁹⁸ In many instances, their (NGO) goals may be counterproductive to park policy or contrary to the development of good relations with local communities.

Uganda National Parks must more clearly define the relationship between these NGOs and the Chief Park Warden/Management Committee. These NGOs and their associated researchers should be there to provide scientific data and advice to the warden and the management committee as to what actions might be taken to assure sustainability of the park on both economic and ecological grounds. The Warden and the Management Committee should be in the driver's seat, not the NGO. Unfortunately, at present too often, this does not appear to be the case” (Ogwang & DeGeorges, 1992).

³⁹⁸ Dr. Eldad Tukahirwa, Director, Makerere Institute of Environment and Natural Resources.

At the time, one would have thought that Bwindi was a WWF park, Queen Elizabeth National Park a GTZ park and Kibale Forest a Wildlife Conservation Society (WCS) park, with little or no relevance to local communities or Ugandan society as a whole. de la Harpe, Fernhead, Hughes, Davies, Spencely, Barnes, Cooper and Child (2004, *In: Child, B., 2004a*) conclude that current park and protected area policy in most of Sub-Saharan Africa serves only interests of urban (mostly overseas tourists and trophy hunters) and elite (e.g., governments, NGOs, tourism and safari operators) segments of society. They believe that this will likely produce a scenario of shrinking national park estates and for that matter, protected areas – implying that rural people seeing no long-term value in these areas will continue opting out for other land uses.

In the authors' view these "Western NGOs", be they local or international, have a suburban mentality. "Biodiversity" and "Preservation" are for salaried people who buy their food at a supermarket. Suppose tomorrow, the world's suburbanites went to the supermarket and, low and behold, there were armed soldiers blocking the entrance, explaining that the contents of the supermarket were for foreigners from overseas. How would people react to their very basis of survival and that of their families being confiscated; the resources that nurture their families? Is this any different to a rural African whose grocery store is the forest, savanna, streams and lakes that provide his family with critical foods and medicines that supplement on-farm produce? How should we expect someone whose life and survival is so closely tied to these resources to react when a conservation NGO in an air-conditioned land cruiser shows up and explains that these resources are no longer available, that this critical area to the survival of a rural community is now a park or hunting block to be enjoyed by and benefiting everyone but the very people who have been its stewards for hundreds of years?

As Nelson (2003a) states, “ ‘the rural poor in Africa tend to be weak and marginal to their countries’ affairs...they can be, and often are, ignored by their rulers’ (Brockington, 2002 *In: Nelson, 2003a*). By contrast, ‘conservation receives continual and valuable support from a number of non-governmental organizations (NGOs), which lobby and raise money for conservation causes. They provide valuable funds to African governments’ ” (Brockington, 2002 *In: Nelson, 2003a*).

Foreign tourism, both consumptive and non-consumptive, also brings in large revenues that can be used to support the Africans who staff government agencies. The NGOs are important, not only for the direct infusions of money they contribute, but also for the political legitimacy they provide.

According to Brockington (2002 *In: Nelson, 2003a*), “ ‘the resources provided by conservation interests, as well as the powerful rhetoric of providing for future generations, may serve to justify the existence of protected areas to government officials.’ ”

Thus, African government park and game departments become more responsive to the desires of Western NGOs and donor whims on how protected areas should be managed, than to the desires and needs of the peripheral communities.

11.10.6.2 “Conservation and development” a continuation of failed “integrated rural development” linked to “preservation”

Western donors groped in the dark for a solution to development and overcoming Africa’s backwardness, since solving rural Africa’s problems on the farm; an “integrated rural development” approach, had failed in the 1970s and 80s. The NGOs, being handed donor money, be they “development” NGOs or supposed “conservation”, but mostly Western “preservation” NGOs, had no experience in natural resource management and an urban preservationist bias. The new buzz word became “conservation and development”, which is another way to say

“preservation” or no use linked to failed “integrated rural development” approaches.

Conservation NGOs linked to development

Another phenomenon, which began to occur in post-colonial Sub-Saharan Africa, is that resource managers of colonial times, who started out working as game rangers and through a series of apprenticeships, eventually rose to manage a game reserve, were replaced by doctoral researchers. These researchers were trained in and/or from America and Europe who studied wildlife and tested hypotheses, but who had no training in resource management, or ideological foundations in sustainable use. This is especially true in Kenya and Uganda.

Researchers not managers, dominate the majority of the conservation NGOs being given conservation and development money. Many were introverts; scientists and researchers studying single species among Africa’s charismatic mega-fauna; people who were happier studying wild dog, elephant, gorilla and chimpanzee, but with no experience in dealing with people or development, let alone managing or valorizing wildlife or other natural resources. They were flooded with money to link conservation and development. As described by Fairhead and Leach (2003), donor funded NGO projects tend to be staffed by scientists, very often uninterested or incapable of relating to rural people – caring more for wildlife than human beings. These NGO projects, through a grey, often glossy, literature, with little or no peer review, project environmental history in their eyes – “networked into the global policy and research community” contributing to the “accumulation of ‘lessons learned’ and to the ‘cutting edge’, globally relevant reputations of those who designed them” (Fairhead & Leach, 2003). Myth becomes reality if repeated enough by many individuals and NGOs through

global media, with such themes as “elephants are endangered”, “parks are saving wildlife”, and “preservationist policies are helping rural communities develop”.

These researchers and their NGOs tend to know only how to study nature, but not how to use it sustainably. Thus, they tend to take a protectionist precautionary principle approach to what they inappropriately call conservation, which by its definition requires a sustainable use component, although there are always exceptions that are dependent on individuals more so than the organization (see Chapter 9, Section 9.2.1, Precautionary Principle; Studying Wildlife to Extinction). Overnight, these impoverished NGOs and their researchers were given control over development money and *de facto* control over vast chunks of Sub-Saharan Africa, its parks and protected areas and, more importantly, control over how and if Africans accessed their natural resources. In essence, these NGOs, through the money they controlled *de facto* determined African conservation policies. This includes NGOs such as the Wildlife Conservation Society (WCS), Conservation International (CI), World Wildlife Fund (WWF)/World-Wide Fund For Nature, African Wildlife Foundation (AWF) and The Nature Conservancy (TNC). They became all-powerful “conservation gods”.

Development NGOs linked to conservation

In the other extreme, people and organizations with backgrounds in food relief and maybe on-farm development (e.g., CARE and Catholic Relief Services), but no resource management backgrounds, were given money to link conservation and development. Having no resource management skills, they also opted for more “Sherwood Forests”, that is, protected areas. Most parks in Sub-Saharan Africa have become hard-edged, surrounded by poverty. In these zones of poverty, they created tree farms (see Chapter 9, Section 9.8.9.3, Community based natural forest management, “*Gestion des Terroirs*”, Burkina Faso), which

most people did not want, set up fish culture ponds and pushed improved agriculture, though most were neither soil scientists nor agronomists. In some cases, they tried to raise culturally or commercially important plants from the forest in gardens on agricultural lands. No natural systems were managed. Local communities were actually cut off from accessing their natural resources or had to “poach” them.

Thus, in both cases the scientists/researchers and aid NGOs went for failed “integrated rural development”, on the farm, as opposed to helping rural communities sustainably manage a diverse portfolio of sustainably managed natural resources (soil, forests, wildlife, fish, bees and wild plants) as a means of improving local economies. Sogge (2002a) believes integrated rural development failed because it tried to impose new power structures answerable to donors (or their NGO surrogates) and because it opened the door to local opportunists, answerable only to themselves. What this implies is that it bypassed traditional management systems and controls, as described in Chapter 2. Meanwhile, in most cases, preservationist approaches continue to exclude rural communities from their natural resources.

Ultimately, from conservation to development, NGOs have been tools to retain neo-colonial controls over Sub-Saharan Africa, taking over from missionary societies of the colonial era “in expanding and consolidating neo-liberal hegemony in the global context” (Manji & O’Coill, 2005). These “modern day ecological missionaries” came to “Save African Wildlife from Africans” and were every bit as harsh as their colonial masters. Parker (2004) equates the young western biologist of today, going forth into the Third World to preach conservation (in most cases meaning preservation) to colonial missionaries and doctors who went forth to stop slavery (i.e., today stop poaching). He equates the Church Missionary Society and the Universities’ Missionary Society to WWF,

IUCN and similar bodies, with those at the top living nicely. As with the missionary David Livingstone, the modern conservationist is more concerned with cash flow than truth and accuracy. Similarly, as Livingstone was responsible for 19th century Victorian perceptions of Africans as primitives without history (Parker, 2004), modern conservationists are responsible for degradation narratives that Africans are incapable of managing their natural resources. “Degradation narratives” that Africans are incapable of managing their own resources, are often used to justify international organizations taking control of resources from African states. What little we know about African environments is almost fatally compromised by degradation narratives essential for colonial control and carried on to the present (Giles-Vernick, 2002; Maddox both 2002 *In: Dovers, et al.*, 2002). Some call their actions “eco-colonialism”, “environmental colonialism” (Nelson, 2003a) or “eco-imperialism” (Duffy, 2000). Child, B. (2004b *In: Child, B., 2004a*) believes that a highly disproportionate number of people employed in national and international conservation organizations are based in capital cities linked to powerful special interest groups, who are in turn linked to Western donor money, as discussed. This is the Achilles heel of liberal democracies where 1% of the population has the power and the money to disenfranchise the interests of the 99%, especially those living with nature in rural areas, with the end result of huge economic inefficiencies and inequities being created.

11.10.6.3 Few success stories with the 10% factor

“In 1962, there were some 1,000 official PAs (protected areas) worldwide. Today there are 108,000, with more being added every day. The total area of land now under conservation protection worldwide has doubled since 1990, when the World Parks Commission set a goal of protecting 10% of the planet's surface. That goal has been exceeded, with over 12% of all land, a total area of 30.4 million km² (11.75 million square miles), now protected. That's an area greater than the entire land mass of Africa” (Dowie, 2005).

The net results are visually evident. Look across the Sub-Saharan African landscape at over 40 years of Western development aid and you will look hard and far to find a true success story, other than more protected areas and more alienated Africans who poach to access resources which should be sustainably managed through the formal integration of Africans into their harvest. In Sub-Saharan Africa, over a million km² of land has been set aside as national parks and game reserves (Hitchcock, 1990 *In:* Colchester, 1994; 2003), yet they have been remarkably unsuccessful at protecting wildlife (Colchester, 1994; 2003). Given today's human populations, creating classical protected areas of exclusion, with the IUCN goal of 10%³⁹⁹ of a national territory under such regimes (Magome & Murombedzi, 2003 *In:* Adams & Mulligan, 2003), can only happen at the expense of displacing and compressing rural Africans along with increased impoverishment and habitat degradation in the compressed areas (Table 11.10).

In Africa alone, it is estimated that there are as many as 14 million displaced persons from creation of parks and protected areas, 600,000 alone in Chad during the 1990s from the increase in national land under protection of 0.1% to 9.1% (Dowie, 2005). Based upon a range of 1-16 persons/km², it is estimated using 1997 IUCN protected area categories I-V (1,540,430 km²) that from 1.5 and 24.5 million (900,000 to 14.4 million using categories I-III) people have been displaced from creation of African parks and protected areas. Using a density of about 25 persons/km², and the same 1997 data, a range of from 22.9-39.5 million displaced persons is obtained, mostly within the last 3 decades of the 20th century (Geisler & de Sousa, 2000).

³⁹⁹ Fairhead and Leach (2003) state the IUCN goal as 10% of all terrestrial ecological regions worldwide.

“People are confined to small and inappropriate land areas; traditional social institutions and patterns of land management and tenure, which used to regulate access to resources are undermined. Short term problem solving behaviors replace long term planning. The net result is environmental degradation” (Colchester, 1987 *In:* Colchester, 1994; 2003).

Extracted From: (1) WCMC (1996) (2) UNEP/WCMC (1997) (3) UNEP-WCMC (2004) with permission, Jon Hutton Director, United Nations Environment Program-World Conservation Monitoring Center (UNEP-WCMC)

“As long as conservation operates on the notion that saving wild animals means keeping them as far away as possible from human beings, it will become less and less relevant to modern Africans. Parks and other protected areas will eventually be overrun by people's need for land unless the parks serve, or at least are not completely inimical to, the needs of the local population...Conservation will either contribute to solving the problems of the rural poor who live day to day with wild animals, or those animals will disappear” (Adams & McShane, 1992 *In: Colchester*, 1994; 2003).

Sadly, to date, none of the human rights NGOs have held the conservation NGOs accountable for what they are doing to indigenous peoples in the name of conservation; resulting in environmental degradation, impoverishment, malnourishment and cultural genocide. It would seem that words like “biodiversity”, “conservation” and “endemism”, are part of some holy grail that is

there for the good of mankind and not to be questioned. These NGOs appear accountable to no one.

“The challenge is to find a means of making conservation organizations accountable to what is for them an unfamiliar constituency, indigenous peoples, so that they are obliged to treat indigenous peoples' concerns with the seriousness they deserve” (Colchester, 1994; 2003).

Magome & Murombedzi (2003 *In:* Adams & Mulligan, 2003) estimate that for South Africa to attain the goal of 10% of its lands in protected areas as defined by the IUCN, about 50,000 km², equivalent⁴⁰⁰ to 2.5 times the size of Scotland, must be acquired. If one adds in the 1999 estimate of 17 million ha in private game ranches (African Advisory Board, 2000), though not considered part of the protected area network, they are 2.2 times South Africa's protected area network and four times the amount of land needed to achieve 10%. It should also be noted that in 2004 Cameroon is actually believed to have 15% of its territory in parks and protected areas and is still increasing this percentage, with a goal of 30% (see Chapter 10, Section 10.7.2.1, Enhancement under the ESA linked to CITES, condemning more wildlife to die? - Enhancement Under The ESA As An Impediment To Conservation Of Cameroon's Elephant).

⁴⁰⁰ Note: By the latest information in Table 11.10, about 41,943 km² must be turned into parks and protected areas (an area slightly larger than Holland, 1.4 times the size of Belgium and 21% of France).

11.10.6.4 Slum lords, only more compression of Africans into unsustainable areas

“Parks cannot be islands of conservation in a sea of often-degraded resources supporting a growing social demand...the local picture is not all optimistic. Many regional national parks and equivalent nature reserves that have been held up as flagships of conservation are in a sad state...paper parks, others are animal slums...poaching is increasing...a failure of the way in which parks and reserves around the world are being managed...a system that owns 10% of the global real estate, but must be subsidized to survive”. (Child, G., 2004 *In:* Child, B., 2004a).

About 40% of Tanzania has been set aside as parks and protected areas. One has to ask, where are the people to live? A fine example of the accelerated habitat degradation from the compression of people onto land that cannot support them, is evident in the hard-edged effect created along the eastern boundary of the Kigosi hunting block, Western Tanzania. The Kigozi Game Reserve/hunting block consists of Miombo (*Brachystegia* spp.) woodlands, while the adjacent inhabited area on its eastern boundary is virtually denuded of these woodlands. Victor Harley (*pers. comm.*), while undertaking game counts with Tanzania Wildlife Research Institute (TAWIRI) in September 2004, observed indications of scattered forest clearings within the game reserve/hunting block, most likely from desperately poor rural people clearing land within the interior, where they cannot be easily detected, for charcoal production and cultivation. As noted, the principal author observed similar activities in the classified forests of Senegal in the 1980s, where rural people left the periphery of the forests untouched so that passing game department officials would not easily observe that they were clear-cutting the interior for charcoal. There is no doubt that poaching is also a problem (see Chapter 5, Section 5.9.4.7, Deforestation in savanna environments - Deforestation in Senegal Linked to Charcoal Making, Over-Population and Declining Fallow Periods).

The Western world seems to have forgotten that there were people using these natural areas before they were declared parks, game and forest reserves. By compressing people onto land that can no longer support them (e.g., similar to homelands in South Africa, communal lands in Zimbabwe and tribal lands in Kenya), the Western conservation world is forcing rural Africans 1) To degrade their environment and 2) To flock to the cities in search of a better life, which usually is not there, resulting in “politics of despair”, returning to the rural areas to illegally access and eventually mine the resources of protected areas which are no longer being managed, but defended against people who have been alienated from Western ideas of conservation (see Chapter 9, Section 9.7.8.2, “Politics of despair”, Southern Maasailand “Tarangire Ecosystem”). Is this any different than what happened during the colonial era to the Red Indian in North America or Sub-Saharan Africa where indigenous people were displaced, to make way for European farmers, onto reservations, homelands or communal areas that could neither ecologically nor economically support them? Only today, people are being displaced in the name of the elephant, gorilla and wildlife in general, with the same dire economic and social consequences and impoverishment; agendas pushed by Western NGOs and supported by donors and African political elite. This is what might be called “Global Apartheid” in which tracts of land are being set aside for a “Global Elite”, consisting of eco-tourists, safari hunters, the private companies who serve these clients, governments and Western NGOs and their researchers. Such elitist “Sherwood Forests” did not work in merry old England and they can in no way work as long as the majority of Africans are stuck in Phase I subsistence lifestyles (see Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA). Rural Africans do not get a pay check each month and they do not have the luxury of buying their food at a supermarket. In addition to what they can grow, the savannas and forests of Sub-Saharan Africa offer them a diverse array of resources (e.g., bushmeat, honey, fish, other wild foods, medicines, wood/charcoal, etc.) which they need for both economic

purposes and for survival, especially as reserves during emergencies, such as during droughts or outbreaks of pests (e.g., locusts and mice). By making these natural systems off limits without alternative livelihoods, is condemning many rural Africans to abject poverty. In a worst state scenario, as will be seen below, in Cameroon (see Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the “Dobi Dobi”, More Parks and Protected Areas), it compresses people into areas that can no longer support them, resulting in habitat degradation on the periphery of the protected area, and potentially starvation, death and cultural genocide. Certainly, this cannot be what the West or Sub-Saharan African governments want from conservation.

11.10.6.5 IUCN Category VI, most appropriate into today’s Sub-Saharan Africa

“It is time that conservationists began to start their work in areas inhabited by indigenous peoples from the assumption that they are dealing with local people with legitimate rights to the ownership and control of their natural resources. The creation of protected areas may not be the most appropriate option in such circumstances, as in most cases indigenous ownership rights are denied by protected area legislation” (Colchester, 1994).

IUCN Management Categories (Chape, Blyth, Fish, Fox & Spalding, 2003) are contained in (Table 11.11). In the authors’ opinion, unless there is a major drive to modernize and urbanize Sub-Saharan Africa, which should be a major goal, the only hope for a successful 10% goal of national lands in natural areas is for the majority to fit into Category VI, sustainable use for community needs. This could include developing a land use plan for multiple use of natural resources with revenue generating components.

Table 11.11: Definitions of IUCN Protected Area Management Categories	
CATEGORY Ia: Strict Nature Reserve: protected area managed mainly for science	Area of land and/or sea possessing some outstanding or representative ecosystems, geological or physiological features and/or species, available primarily for scientific research and/or environmental monitoring.
CATEGORY Ib: Wilderness Area: protected area managed mainly for wilderness protection	Large area of unmodified or slightly modified land, and/or sea, retaining its natural character and influence, without permanent or significant habitation, which is protected and managed so as to preserve its natural condition.
CATEGORY II: National Park: protected area managed mainly for ecosystem protection and recreation	Natural area of land and/or sea, designated to (a) protect the ecological integrity of one or more ecosystems for present and future generations, (b) exclude exploitation or occupation inimical to the purposes of designation of the area and (c) provide a foundation for spiritual, scientific, educational, recreational and visitor opportunities, all of which must be environmentally and culturally compatible.
CATEGORY III: Natural Monument: protected area managed mainly for conservation of specific natural features	Area containing one, or more, specific natural or natural/cultural feature which is of outstanding or unique value because of its inherent rarity, representative or aesthetic qualities or cultural significance.
CATEGORY IV: Habitat/Species Management Area: protected area managed mainly for conservation through management intervention	Area of land and/or sea subject to active intervention for management purposes so as to ensure the maintenance of habitats and/or to meet the requirements of specific species.
CATEGORY V: Protected Landscape/Seascape: protected area managed mainly for landscape/ seascape conservation and recreation	Area of land, with coast and sea as appropriate, where the interaction of people and nature over time has produced an area of distinct character with significant aesthetic, ecological and/or cultural value, and often with high biological diversity. Safeguarding the integrity of this traditional interaction is vital to the protection, maintenance and evolution of such an area.
CATEGORY VI: Managed Resource Protected Area: protected area managed mainly for the sustainable use of natural ecosystems	Area containing predominantly unmodified natural systems, managed to ensure long-term protection and maintenance of biological diversity, while providing at the same time a sustainable flow of natural products and services to meet community needs.
Source: Chape, Blyth, Fish, Fox and Spalding (2003) with permission, IUCN.	

Might it not be a better idea to give these protected areas over to local communities, train up their youth at university level in diverse fields such as tourism, wildlife, fisheries, forest and range management, as well as agriculture, so that they can create community-owned companies and manage these areas to the benefit of the community, as described in Chapter nine (see Chapter 9, Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders)? Profits could go towards both development and sending as many youth as possible off to universities to study everything but conservation, so that they can eventually earn a living in an urban setting as part of a global society, taking the pressure off rural Sub-Saharan Africa's limited natural resources, given current human and livestock populations.

de Haan, *et al.* (1997) argue that for many natural areas to survive, they must integrate rural inhabitants living on the land into their management and multiple-use,

"For the sub-humid tropical savannas, the emphasis has to be on the development of multiple uses, combining sustainable farming systems with integrated wildlife-livestock management and the establishment of a few protected areas for key plant and animal species. However, with increasing population pressure, this becomes more difficult. Furthermore, many government agencies in the developing world are too weak and, in the developed world, too dependent on political fashion, to rely (relying) exclusively on protected areas for biodiversity conservation, especially for big game of the sub-humid savannas. Eco-tourism and commercial (trophy) hunting would need to be integrated with commercial livestock production and mixed farming".

This will also need to include other resource uses to maximize both survival and economic benefits as a means of justifying to rural people the maintenance of these natural systems.

Unfortunately, de la Harpe, *et al.* (2004, *In: Child, B., 2004a*) believe that it is in the interest of the entrenched bureaucratic-cum-scientific elite to maintain the status quo and the power of the state, often linked to power, accumulation, patronage and corruption through control of wildlife and other natural resources.

However, subsidized biodiversity conservation and highly centralized park management are being questioned in favor of a decentralized model, localizing management and benefits with parks serving as bridgeheads for wildlife-based economic development (Child, *et al.*, 2004a *In: Child, B., 2004a*). de la Harpe, *et al.* (2004, *In: Child, B., 2004a*) believe that conservation as currently practiced in Sub-Saharan African, is not sustainable since without commercialization and as a result of the low funding to wildlife and park departments across the continent, these agencies are unable to satisfy either biodiversity or social goals. de la Harpe, *et al.* (2004, *In: Child, B., 2004a*) and Child, Castley, Knight, Gordon, Daitz, Johnson, Boonzaaier, Collinson, Davies, Grossman, Holden, Kiss and Fernhead., (2004b *In: Child, B., 2004a*) are calling for a paradigm shift, especially within Sub-Saharan Africa's parks, but in protected areas in general with the idea of parks and protected areas becoming "engines of economic growth", with biodiversity being a welcomed by-product as opposed to the situation today where biodiversity is the major goal. They conclude that for parks in Sub-Saharan Africa to survive these human pressures, they must pay their own way as long as ecological management is sustainable.

This implies opening up parks to any number of income generating activities such as trophy hunting, private sector lodges and traditional activities such as thatch grass harvesting, honey collection, fishing, traditional medicine harvest and traditional hunting, as long as what is happening is sustainable ecologically and economically. In essence, parks and protected areas in Sub-Saharan Africa will have to become "living factories" without walls, sustainably producing renewable

products with the majority of profits accruing to rural communities at both an individual and collective level.

Ron Thomson (*pers. comm.*) former park warden for both Hwange and Gonarezhou national parks, Zimbabwe, has advocated trophy hunting in parks for many years. Each park will have to be dealt with on a case-by-case basis as to what peripheral communities desire from these areas and how these needs and desires can be integrated into management of the park on a sustainable basis without adversely impacting biodiversity. Possibly older redundant animals, such as hundred pound elephants about ready to die from old age, should be trophy hunted to generate income for park management and the communities?

The West must realize that as things stand, it is only making matters worse in creating massive exclusion zones that have nothing to do with the value systems or needs of people living close to and off of nature and who, as things currently stand, will only see the inside of a park/protected area illegally. Parks and protected areas, as they currently exist, are not meant for Africans. This will have to change if Sub-Saharan Africa's natural systems are to survive the next 50 years and a more than doubling of the current human population. This will require a major paradigm shift in defining conservation in SSA and it will have to be people oriented,

“The Need To Take Care Of People First In Order To Take Care Of Wildlife... unless the rural people of Africa, who live among wildlife, see its economic potential, no amount of market driven prohibitions, nor Western funded anti-poaching will save Africa's wildlife. Africa's human population is expected to double and in some cases triple over the next 25 years⁴⁰¹. Either rural Africans see wildlife as their economic and cultural future or wildlife and its

⁴⁰¹ Human population will increase about 2.8 times between 2000 and 2050 to about 1.8 billion people (see Chapter 5, Section 5.9, OVER-POPULATION, SOIL DEGRADATION AND DECLINING AGRICULTURAL PRODUCTIVITY

critical habitat will disappear, being converted into subsistence mealie (corn) fields and over-grazed pasture. What little is left will be surrounded by a sea of humanity which will eventually devour the remaining islands of nature on private farms and public lands” (SCI African Chapter, 1996).

The role of parks and game departments must become one of service and value, as opposed to a culture of control (Child, *et al.*, 2004a *In:* Child, B., 2004a). To think that parks and protected areas in any other format can survive the doubling of Sub-Saharan Africa’s human population in the next 50 years, is naïve.

Future training of game department staff must emphasize sociology/anthropology, management, monitoring and extension. Uniformed paramilitary trained game guards, who see peripheral communities as the enemy, must be replaced by minimally uniformed wildlife extension agents, ideally recruited from the communities. In essence, wildlife must be seen as a renewable economic resource, just as soil in agriculture, only instead of agricultural extension agents, wildlife/natural resource extension agents will work with rural communities to manage and valorize wildlife and other resources where they have a comparative economic and ecological advantage over farming (e.g., most of the savannas that constitute 70-75% of the land mass in Sub-Saharan Africa and many of the tropical lowland hardwood forests – see Chapter 5). If this paradigm shift occurs, communities will hire their own force to police wildlife and likely do a better job at less cost than government. The ultimate goal is to take marginal agricultural land and use it as an economic resource, transforming what would yield US\$ 7/ha in small stock raising to US\$ 8/ha in game ranching to US\$ 30/ha in multi-faceted high-end ecotourism (e.g., trophy hunting and luxury tourism) (Child, *et al.*, 2004b *In:* Child, B. 2004a). Thus, conservation becomes an incentive led business, “conservation is really about getting the most value out of resources without damaging them” through monitoring in order to assure ecological

sustainability and biodiversity, with the majority of benefits accruing to society (Child, B., 2004a), especially the rural poor peripheral communities.

“On the other hand, one cannot assume that once an area is under indigenous ownership and control the problem is solved and that all indigenous systems of land use are inherently sustainable. This is patently not the case. Indeed many indigenous communities are fully aware of the fact that as pressure on their lands from outside intensifies and as their own economies and social organization change to accommodate their increasing involvement in the market economy, they need to elaborate new mechanisms to control and use their resources. Ecologists, social scientists, lawyers and development advisers may have relevant knowledge to contribute to such indigenous communities to help them achieve this transition. Their role, however, is to act as advisers to indigenous managers rather than directors of indigenous ventures” (Colchester, 1994) (see Chapter 9, Section 9.7.5, Lack of Technical and Management Skills).

Makuleke Contractual Park

In light of the above, de la Harpe, *et al.*, (2004 *In:* Child, B., 2004a) question the relevance of the IUCN classification of parks and protected areas to Sub-Saharan Africa. Ultimately, this means Categories II and VI above will to some degree merge, parks possibly having smaller core protected areas, while as with the Makuleke Community in South Africa (see Chapter 9, Section, 9.6.3.7, Makuleke Contractual Park, South Africa), large portions of the national parks will have to be “de-gazetted” as some form of contractual park that allows multiple use, but not conversion, to agriculture and/or livestock.

Multiple Use in Pilanesberg and Madikwe Parks – Need to Integrate People

Pilanesberg and Madikwe parks, Northwest Parks Board, South Africa, are already being managed for both high end tourism, trophy hunting and game

capture, though there is still some question of how much of the profits/turnover are being captured by the peripheral communities; believed to be very little. Pilanesberg also allows the collection of firewood by communities. According to the Boruakgom Farmers Association and Lorimer and Associates Ecotourism Consultants (2004),

“conservation areas within the membership of the Boruakgom Farmers Association were created as early as 1987. The concept of the Madikwe Conservancy was tabled at meetings of the association many years before the creation of the Madikwe Game Reserve. Bop (Bophuthatswana) Parks followed this example in 1992 and used members of the association in the planning and promotion of the idea of a game reserve. Madikwe was to be developed for the benefit of all the people living in this area. Madikwe Game Reserve was to be created to be a peoples park, developed, first, as a conservancy or conservation area, where the needs of local people came before those of conservation and wildlife. Local people were to be fully involved in the planning and development of this game reserve where 40% of gross income⁴⁰² was to be used for community upliftment. This has never happened. These and many other promises made by the North West Parks and Tourism Board have not been kept and a climate of mistrust now exists between Madikwe Game Reserve and many of its neighbors living in the North West Province”.

Magome, Grossman, Fakir and Stowell (2000) provide an excellent historical perspective on how the 47,000 ha Madikwe Park went from white-owned to black-owned cattle ranches and then into a park. Lack of land tenure rights by the Madikwe community is a major weakness in their being able to bargain for an appropriate share of the benefits from this venture. In fact, the state has taken ownership.

11.11 CASE STUDIES, USE OF FOREIGN ASSISTANCE TO IMPOSE WESTERN PRESERVATION PHILOSOPHIES ON RURAL AFRICANS

11.11.1 Western Urban Preservationist Biases Imposed on Rural Guineans

Fairhead and Leach (2003) give two examples of Western preservationist biases imposed on rural resource-dependent Africans: 1) At a 1999 meeting to establish a “Prefectoral Federation of Forestry Groups” in Kissidougou, Guinea-Conakry, with facilitation by the EU funded Niger River Protection Project, resulted in Western biases being concluded - village anxieties over state intrusion into their autonomous management of traditional village forests were not voiced/brought out. Village reports, as an outcome of this meeting, did not envision timber exploitation then, or in the future, by village “Forestry Groups (*Groupements Forestiers*)” with forest preservation favored over exploitation being institutionalized in the federation – while on-the-ground forest exploitation would be a reality and 2) A 1999 Conservation International (CI) West African workshop on biodiversity was framed in such a way that national representatives could voice neither their own or land users’ concerns. The program director concluded that due to the “time bomb” and the recurring theme of “nature for nature’s sake”, the matter was too urgent for the niceties of community involvement. This was in conflict with Guinean delegates, who saw biodiversity within the context of its use, community meetings around national park planning and creation of biodiversity plans, including resource users such as traditional hunters and herbalists. Fairhead and Leach (2003) believe even Guinea-Conakry’s approach was not all inclusive, failing to identify and involve groups such as charcoal-makers, commercial hunters and bushmeat traders, giving one the impression that subsistence use was okay, but maybe not commercial use – often a theme pushed by Western conservationists, as though only Westerners have the

right to earn income from natural resources, while rural Africans have only the right to subsist. Such exclusion failed to obtain the knowledge and perception of these stakeholders or to acknowledge that they must become a critical part of resource management plans, as these two commercial uses will not be stopped due to the tremendous urban demand for both charcoal and bushmeat in West Africa.

11.11.2 Donor Driven Conservation, Lake Mburo National Park (LMNP), Uganda

“The main beneficiaries of conservation at LMNP - and of its increased likelihood because of the CC (community conservation) initiative - are international and Ugandan conservationists, the Ugandan conservation bureaucracy, donor agencies and foreign tourists and visitors. In the extreme, a case could be made that LMNP is a well-disguised form of ‘quiet violence’ that provides benefits to a small national and international elite (and tens of millions of couch potato conservationists worried about African wildlife) while making the livelihoods of tens of thousands of rural Ugandans poorer: ensuring that some have no supper, some have no schooling and some remain unemployed or underemployed! In theory the Park, along with the rest of the country’s conservation estate, is for ‘the people of Uganda’ both present and future. In practice fieldwork indicated that the priorities of local people place a high value on environmental changes that the Uganda Wildlife Authority (UWA) and conservationists would regard as environmental degradation...Is community conservation a means by which we direct marginal additional benefits to local communities and talk of ‘participation’ while avoiding the fundamental question of who bears the costs of conservation in Africa? If it is, then this is to be deplored. If it is not, then we should be aware of the long term outcome: that eventually communities will define what ‘conservation’ is rather than national and international elites. For the Lake Mburo region, at least, this will be a fundamentally different definition, based on natural resource sustainability, images of the landscape and opportunities for tourism, rather than the biodiversity criteria that have been pursued at LMNP to date” (Hulme, 1997).

11.11.2.1 Historical background

Traditionally, Uganda's parks and reserves were established during the colonial era with a "Sherwood Forest Approach" in which they were set aside as exclusion zones (that is, exclusion of local residents) to the benefit of the Crown. These areas, especially parks and game reserves, were for the most part, initially established and managed by dedicated professionals coming out of a strong military background. They were run as a paramilitary operation with a warden and his heavily armed rangers pitted against the enemy (the local people) who were told in no uncertain terms that to cross into the protected area's boundaries without express permission from the authorities could mean severe punishment. This paramilitary culture is still evident today in the newly formed Uganda Wildlife Authority (UWA) (Hulme, 1997) and, in fact, most wildlife authorities across Sub-Saharan Africa.

For example, community relations with park authorities grew so bad that even as late as the 1970s, park personnel working in the lodges at Murchison Falls National Park were confined to the lodge grounds for fear of attack if discovered by locals walking along the road. Lodge employees even feared being poisoned and thus, did not even frequent local villages or towns, eating all of their meals on park grounds. In those days, there was a shoot to kill policy for anyone found within Murchison Falls National Park. Many people who innocently wandered across park boundaries are believed to have been shot or incarcerated with little cause (Ogwang & DeGeorges, 1992).

The dominant ethnic group from the Lake Mburo area is the Banyankole, which can be divided into two sub-groups, the Bahima and Bawiru (see Chapter 2, Section 2.3.2, Pasture and Water and Chapter 11, Section 11.6.6.2, Uganda, democracy, civil war and attempts to find an African solution). The Bahima were traditional pastoralists of long-horned Ankole cattle, while the Bawiru were

cultivators. Today both grow crops like bananas, beans, maize and cassava (Averbeck, 2001).

Similar to Tanzania and Kenya, Lake Mburo's cattle and wildlife populations in the 1890s were hit by a series of events, as described in Chapter three, which reduced human and cattle numbers in favor of wildlife. By the 1930s, the colonial administration declared the area a Game Control Area (GCA) with regulated hunting. By the 1940s, bush encroachment (likely from over-grazing), and possibly protection (no harvesting of firewood/charcoal) and fire suppression by colonial administrators, resulted in tsetse fly invasion and an abandonment of the area by humans and their cattle to avoid sleeping sickness. In the 1950s/60s, a tsetse fly eradication program involved mechanical bush removal, spraying of insecticides and shooting game. This resulted in the opening up of the bush and a dramatic reduction in game populations. Eventually, the GCA was converted into a Controlled Hunting Area (CHA) (Hulme, 1997). Over the course of the 20th century, and following the eradication of tsetse-flies from the area, the Bahima increasingly moved their herds into areas adjacent to Lake Mburo (Averbeck, 2001).

At the end of the colonial era, the Lake Mburo CHA was converted into the 648 km² (250 mi²) Lake Mburo Game Reserve (LMGR), which allowed the 241 families judged to be 'resident' in LMGR, to remain in the area and to cultivate around their homesteads (Hulme, 1997). It also served as a strategic area for livestock due to the availability of dry season water and grazing. Bahima pastoralists communally managed much of the area outside of the game reserve. It was re-gazetted as a national park under the Obote regime in 1983.

In 1963, USAID sponsored a tsetse fly eradication program (Ogwang & DeGeorges, 1992) followed by the Masaka/Ankole Ranching Schemes (Ogwang

& DeGeorges, 1992; Lamprey, Buhanga & Omoding, 2003), to privatize and divide up land around the game reserve into ranches for beef and milk production. The total area of the Ankole Ranching Scheme was 648 km² (250 mi²), broken up into fifty 1,295 ha (5 mi²/3,200 acres) ranches. The hope was that the Bahima cattle keepers of Ankole would abandon traditional attitudes of extensive pasture management and self-sufficiency. The government subsidized the construction of fencing and installed two valley tanks in each ranch, helped design and plan layouts of ranches and establishments, maintained feeder roads and fire breaks and covered the cost of cattle dip construction materials, fencing materials, water tanks and pipes. Ranchers received free land and a variety of ranch-related services at virtually no cost. The main objective was rapid and radical development of intensive land and animal husbandry practices, producing beef and milk to satisfy internal demands and surplus for export (Ogwang & DeGeorges, 1992).

This scheme was advertised in the newspaper. The only requirements to obtain lease titles to these ranches were: 1) Literacy, 2) 200 head of cattle and 3) 200 USH (a lot of money in those days). This excluded illiterate and penniless Bahima pastoralists, the very people that the schemes were meant to help (Ogwang & DeGeorges, 1992).

“Ranch units in the schemes were allocated to educated elite in the best position to apply for them, whilst the majority of poor and uneducated pastoralists were alienated from these large areas” (Lamprey, *et al.*, 2003).

As a result, these ranching schemes marginalized pastoral people, leaving them without alternative grazing land. Many, along with there large numbers of livestock, were made landless. These landless pastoralists struggled to settle with their herds as squatters in Lake Mburo Game Reserve, in forest reserves, in other

game reserves and on government sponsored ranching schemes (Ogwang & DeGeorges, 1992; Lamprey, *et al.*, 2003).

Though, legislatively not legal, The Game Department gave a number of these landless pastoralists permits to graze their cattle within the gazetted limits of the Lake Mburo Game Reserve. Unfortunately, the permit did not limit the number of people and as the extended families grew, so did the number of livestock (Drani, *pers. comm. In:* Ogwang & DeGeorges, 1992).

In 1977, Lake Mburo Game Reserve contained 159 families. Plans existed to resettle them on the eastern boundary of the reserve, but the set aside 39 km² (15 mi²) area was given to another group.

The pastoralists remained until 1983 when they were forced out at gunpoint when the game reserve was gazetted a national park. Herders returned with a vengeance, as the then Obote Government fell apart in 1985, ransacking and destroying most of the park facilities and infrastructure as a demonstration of their disdain for such an institution (Ogwang & DeGeorges, 1992). It is no wonder that they sought revenge since when expelled, huts were set on fire, cattle chased into the bush, people were physically abused and there were reports of killings (Hulme, 1997).

This history is not unique to Lake Mburo National Park, but typifies the troubled relationships and conflicts that have existed between parks and people since their inception throughout Sub-Saharan Africa and much of the colonized world. The net results of relocation are traumatic (see Chapter 7, Section 7.10.1, Dam Impacts on Displacement of People). Colchester (1994) gives a number of examples, citing that of the Kibale Game Corridor, linking Kibale Forest to Queen Elizabeth National Park, where 30,000 people were removed against their will.

'We were chased out on the first day. I didn't know anything was happening until the police ran into my compound. They all had guns. They shouted at me, told me to run. I had no chance to say anything. They came at us and we ran, they came so violently. I was frightened for the children - I had 8 children with me - but we just ran off in all directions. I took my way and the children took theirs. Other people were running, panicking, even picking up the wrong children in the confusion. I lost everything. I had 31 cows and some goats and hens. They were killed - 20 cows were killed and the rest taken. They burned everything, even the bed and furniture and the kitchen. We're poor now.' " (Joy Ngoboka, evicted from the Kibale Game Corridor, Uganda, 1 April 1992 cited in Feeney, 1993 *In: Colchester*, 1994).

Shortly after the evictions the EC's chief technical adviser reported that: "'This successful operation...has opened up the possibility of the frustrated elephant population of Kibale once more being free to migrate between the Queen Elizabeth National Park and the forest...' " (cited in Feeney, 1993 *In: Colchester*, 1994).

In 1986, with the establishment of a new government, people took advantage of lawlessness and the lack of management to come back in Lake Mburo Park as squatters on the ranches and in the park. Immediately, opportunists came in from other areas and people and livestock numbers increased. These squatters refused to leave the ranches and there were reported fights with ranch owners (Drani, *pers. comm.* *In: Ogwang & DeGeorges*, 1992). They invited hunters to shoot the wildlife out ("revenge killing"), thinking that the government would not want to reserve land for wild animals and if they killed all the game, the government would abandon the idea of a reserve/park in favor of agriculture and livestock (Hulme, 1997).

Because of the controversy, the Government decided to leave pastoralists alone until the problem of landlessness could be resolved. All private ranch leases

were suspended and the Ranch Restructuring Board established to determine how to resettle these pastoralists on the ranches.

As of December 1992, Lake Mburo had 20,000 illegal resident cattle (Drani, *pers. comm.* In: Ogwang & DeGeorges, 1992). It is estimated that during the dry season up to 80,000 cattle grazed within the park (Ogwang & DeGeorges, 1992; Infield,⁴⁰³ *pers comm.* In: Hulme, 1997). The number of cattle does not seem to have changed significantly (see Table 11.12).

Table 11.12: Game population estimates for the Lake Mburo ecosystem, 1992-2002

	1992 (a)	Dec. '95	May '96	Oct. '97	May '98	Feb. '99	July 2002
Huts	8611	7,068	5,435	6,130	6,552	6,730	5,795
Cattle	65,243	110,304	124,695	58,969	98,483	80,298	66,609
Sheep/ goats	11,026	7,259	7,594	7,819	10,199	9,601	13,019
Kraals	1,792	1,066	1,088	1,457	874	1,156	944
Impala	18,691(b)	6,599	7,442	6,817	4,124	1,595	2,956
Zebra	3,446	2,430	1,574	3,254	3,748	2,249	2,665
Eland	N/a	273	88	285	1,442	199	28

Hippo	N/a	51	76			303	97
Waterbuck	N/a	241	287	485	427	598	396

Note: "Estimates below the bold line (Zebra) are only broadly indicative, and should not be used for comparison, as populations are low, extremely aggregated, or inconspicuous, and the systematic reconnaissance flight (SRF) technique cannot yield accurate results" (Lamprey, *et al.*, 2003).

Note: (a) SRF Fixed wing aerial survey techniques for all data (Averbeck, 2001). According to Averbeck (2001), 1992 survey area much larger ($2,010 \text{ km}^2$) than in other years ($1,513\text{-}1,573 \text{ km}^2$), though this alone should have not been cause for the large differences. One major difference is the 1992 survey was undertaken by Olivier, while all other surveys were undertaken in which Lamprey was involved (Averbeck, 2001 & Lamprey, *et al.*, 2003). (b) Averbeck (2001) shows 16,185 impala for 1992 by same surveyor.

Source: Lamprey, *et al.* (2003, Table 2.3) with permission, IFPRI.

⁴⁰³ Mark Infield, CTA, AWF Project, early 1990s, Lake Mburo National Park, Uganda.

The carrying capacity of the Ankole Ranches is about 1,200 cattle/5 mi² (3,200 acres or 13 km²/1,300 ha) ranch, or about 60,000 cattle per the 250 mi² (160,000 acres or 648 km²/64,750 ha) ranching scheme (Jingu, *pers comm.* In: Ogwang & DeGeorges, 1992). The veterinary department recommended a stocking rate of about half or 625 cows/5 mi² ranch (Ogwang & DeGeorges, 1992).

Prior to about 1982, there were about 32,000 cattle on ranches by land owners/tenants. Over the last ten years (1982-1992), 42,000 cattle were brought in by opportunists, amounting to a total of about 74,000 cattle or about 14,000 cattle beyond carrying capacity (Drani, *pers. comm.* In: Ogwang & DeGeorges, 1992), 34,000 if the veterinary department's estimate is correct.

In 1987/88 it was decided as a compromise, to reduce the park from 648 to 259 km² (250 to 100 mi²). Of the de-gazetted 389 km² (150 mi²), 311 km² (120 mi²) were allocated to pastoralists around the national park and 78 km² (30 mi²) allocated to the Kanyayeru Resettlement Scheme along the northwestern border of the park. This resettlement scheme consisted of 600 families from the war torn Luwero District. They were expected to cultivate even though they were traditionally pastoralists and the land was unsuitable for crop production (Ogwang & DeGeorges, 1992).

"The Ranch Restructuring Board has completed some of the modalities of sub-dividing the ranches, including which ranches are squatted and how subdivision is to take place...The issue of squatters has yet to be resolved. This is a very sensitive issue, as Government guidelines require that resettled communities are provided with land and facilities to re-establish themselves. However, little land is now available, and resources are in short supply" (Lamprey, *et al.*, 2003).

In the early 1990s, the African Wildlife Foundation (AWF) *de facto* ran Lake Mburo Park with donor money (Ogwang & DeGeorges, 1992). The Chief

Technical Officer, Mark Infield, was trying to do a good job under a very difficult situation. By 1995, the last of the squatters were moved out of the park, this time through negotiation instead of force through a Community Conservation Unit (CCU) consisting of a Community Conservation Warden and three rangers (Hulme, 1997).

11.11.2.2 Competition for other land uses

Despite donor support and the achievements of the 1990s, Lake Mburo National Park's (LMNP) faces severe financial and land use challenges. The current resource use of LMNP is a substantial drain on Uganda's economy, with its major economic benefits from a minor tourist industry, fishing and the poaching of wildlife. The park has habitat suitable for rain-fed farming, swamps that could be agriculturally productive if drained and some land that could produce "premium" crops such as coffee, along with a large remaining area suitable for cattle grazing. The total agricultural potential of the park is estimated between US\$ 42.7 and US\$ 103.9 million/year. Lake Mburo National Park also acts as a barrier to north-south and east-west communications and trade in the Mbarara District (Hulme, 1997). Similarly, Lamprey, *et al.* (2003) demonstrate the difficulty of wildlife competing with agriculture around Lake Mburo (Table 11.13).

Clearly, sport hunting generates a much smaller revenue per unit of land area than mixed agriculture, but where livestock production is the primary land use it may increase revenues/ha by about 30%. Thus, returns from hunting may be significant if landowners continue with livestock production and forgo cultivation (Lamprey, *et al.*, 2003).

Table 11.13: Revenues from different forms of landuse, Lake Mburo

	UShs/ha/year	US\$/ha/yr
Mixed agriculture	506,500	329
Livestock production	10,500	7
Illegal hunting (unsustainable offtake)¹	6,500	4
Sport hunting as currently practiced²	3,000	2

Notes:

- 1: Extrapolated from Emerton, 1999a *In: Lamprey, et al.* (2003), on assumption that this is ‘lost opportunity’ within LMNP, that the ‘huntable area’ is 130 km², and that similar wildlife densities exist outside in the ranches.
- 2: Based on current sport hunting concession on ranches 46-50 only (75 sq. km.)
3. USH 1,539/\$US Averbeck (2001)

Extracted: Lamprey, et al. (2003, Table 4.6) with permission IFPRI.

Like most parks in Uganda, Lake Mburo National Park operates on a self-financing basis from total income, which for 1996 was UShs 102,945,000 (US\$ 97,580) from 8,365 tourists, mostly day trips providing little added value. This income must cover salaries, road maintenance, revenue sharing and most transport costs must be met: an operation run on a shoestring. The lack of charismatic species in the Park makes it difficult for LMNP to expand into the lucrative foreign tourist market, putting into question the economic viability of the park. Of this income, 20% of the gate fees go to community development (US\$ 19,516) supplemented by donor money. With 80,000 peripheral community members and 1,800 key households (Hulme, 1997)⁴⁰⁴, this comes out to US\$ 10.84/household, typical of household benefits described in Chapter nine (see Section, 9.7.6.4 CBNRM will not create a “middleclass” in rural Africa) – and this is assuming most of the income is from gate fees, since the majority of tourists are day

⁴⁰⁴ Note: Emerton (1999a) estimated about 51,000 people and 7,500 households around Lake Mburo National Park.

visitors. Community small enterprise income generating projects faced a lack of demand, poor management, leadership disputes, a lack of motivation and commitment (Table 11.14).

Table 11.14: Projects financed by the support for community-initiated projects (SCIP) fund and their achievements, Lake Mburo National Park, Uganda				
Project	Main Activities	Size SCIP Committee	% SCIP Committee Members	Status

11.11.2.3 Attempts at collaboration between park management and peripheral community

The Chief Park Warden established a Wildlife Committee of Resistance Committee/Council (RC) chairmen to discuss wildlife/livestock issues and a Fishing Committee, consisting of the Rwonyo Fish Landing and Rwamuhku Village, to address access rights to and management of Lake Mburo's fishery resources (Ogwang & DeGeorges, 1992).

Under pressure from USAID, the establishment of Park Management Advisory Committees (PMACs) met a Uganda National Park obligation, as opposed to being driven by demand from park neighbors. In Lake Mburo National Park, the PMACs functioning has been sporadic and limited (Hulme, 1997). “PMAC has thus largely failed the communities’ need for an institution that can adequately represent their concerns to park authorities” (Barrow, *et al.*, 2000). Barrow, *et al.* (2000) explain with regard to PMACs, Parish Resource Management Committees (PRMCs) or Local Conservation Committees (LCCs),

“The duplication of functions and the failure of PRMCs and PMAC to interact effectively with local government structures has led to the proposal that PRMCs should be replaced by a sectoral committee of local government, a combined Production and Environment Committee. This committee would be responsible for direct interaction with the protected area management on issues affecting parish communities”.

One must ask how many of these institutions come from the communities versus institutions, as noted above, imposed on rural people by outsiders and doomed to failure without taking into account traditional and/or existing institutions to whom the local communities can relate.

Emerton (1999a) estimates that less than 10% of the peripheral population of Lake Mburo National Park benefits from access to its resources. Using data from Emerton (1999a), this is calculated to be US\$ 132/household for 750 out of 7500 households that included grazing, hunting, medicine, firewood, polewood, thatch, weaving material, honey and papyrus.⁴⁰⁵ Benefits from fishing were separated out from this figure.

11.11.2.4 Fishing

A major threat to the park is in-migration by subsistence farmers, increasing livestock numbers to meet demands of a growing dairy industry and commercial crops, especially bananas. The human population is growing at a rate greater than the national growth rate of 2.8/year (Note, based upon latest data 2.9/year, see Section 9.6.1.2, Kifluku Farm, Laikipia, Kenya). Due to the potential agricultural land use within LMNP, there is growing pressure - both by legal and illegal means - to see the park converted to these land uses (Hulme, 1997).

Since the mid-1990s, there has been a focus on the sharing of the Park's natural resources with the local community - with initiatives in fisheries, papyrus harvesting for mat-making, traditional medicines and cattle access to LMNP water resources during periods of drought.

Fishing pressure was controlled by the number of canoes limited to 40, a limit on the number of nets and mesh size. The problem will be for these communities to arrive at a negotiated solution to controlling and sharing this resource. People from the fishing camp and from Kiribwa Village (both herders and cultivators interviewed) seemed ready and willing to collaborate with the park staff to establish a management plan for the park. Representatives from the fishing camp and park headquarters shared places on the RC1 Committee. Fishermen have been elected as

⁴⁰⁵ Emerton (1999a) estimates USH 143.4 million/year or US\$ 98,556/year, based on a conversion rate in 1999 of USH 1,455/US\$ impacting 750 out of 7,500 households.

the RC1 treasurer, secretary and youth head. Kiribwa Village is already selecting RC's to send their views and to begin negotiating with the Park (Ogwang & DeGeorges, 1992).

“Fishing villages are prohibited from being established around Lake Mburo. However, the Rwonyo Fish Landing, near park headquarters is a consolidation of the former fishing villages around the lake. It contains 5 permanent families and 25 temporary fishermen with a total population of about 100” (Ogwang & DeGeorges, 1992).

In 1994, 56 boats landed fish valued at UShs 43,025,946 (about US\$ 40,800). This amounts to US\$ 728/boat or US\$ 364/fishermen, assuming two fishermen/boat. Community relations with park officials have improved as a result of these efforts (Hulme, 1997). In 1997, fishing generated “\$US 48,000, or an average of nearly \$US 1,500 per canoe (implies 32 canoes). Of this total, net income of approximately \$US 41,400 accrued to local residents - 18 of the canoes are operated by UWA staff, and various fees and levies are paid by fishermen - divided 60:40 between license holders or boat owners and fishermen” (Barrow, *et al.*, 2000).

11.11.2.5 Grazing in park

“Lake Mburo National Park is the only non-forest park to make use of MOUs (Memorandum of Understanding) in working with communities. In a process undertaken by the Community Conservation Warden with minimal external assistance, an MOU was negotiated with two community groups to provide their livestock seasonal access to permanent water sources through the park. The Parish Resource Management Committees (PRMCs) played an important role in negotiating the agreement, and were signatories of the MOU. The MOU specified who was allowed access, the number of cattle, and what the responsibilities of the community members were for the implementation of the agreement” (Barrow, *et al.*, 2000).

A cattle corridor has been created and 47 herders with 2,233 cattle were allowed to water their livestock, especially from the Kanyayeru Resettlement Scheme, with the understanding that Parish Resource Management Committees (PRMCs) would develop watering points outside the park. As noted above, Park staff believed these rights were abused (Hulme, 1997).

“Though the process was interesting, and important for UWA in that it extended the principle of resource access from forest to savannah parks for the first time, it has not been a great success. Both community members and park staff have allowed large numbers of users who were not part of the agreement and did not require access to water, to illegally use the corridor for accessing grazing. This led to two problems: households moved into the communities so that they can be included in the access agreement; and households listed in the agreement brought in cattle belonging to people from other communities. It would appear that the motivation for these distortions in the agreement was for community members to gain access to an additional resource not covered by the agreement, in this case grazing. In the case of this agreement, it seems clear that communities have not accepted the responsibility given to them under the agreement. This may be because they perceived the park authorities as being weak, or because they accepted the agreement under duress. High levels of corruption amongst park staff also undermined the agreements” (Barrow, *et al.*, 2000).

The limited use of pasture and no use of timber, poles, medicinal plants or firewood (other than the collection of dead wood for fish-smoking) in LMNP, has resulted in the peripheral community losing access to significant resources. Barrow, *et al.* (2000) estimate that communities still experience a net income loss of US\$ 400,000 from forgoing the exploitation of various natural resources in the park, especially from fishing, hunting and wood products – in essence rural communities are subsidizing conservation. Similarly, Emerton (1999a *In:* Roe &

Jack, 2001) estimates this net loss from foregoing access to resources as UShs 528 million (US\$ 362,887)/year.⁴⁰⁶

11.11.2.6 Poaching

Poaching of wildlife is also an issue, from organized commercial poaching, to subsistence hunting, to ‘revenge’ killing of animals (Hulme, 1997). Another problem is illegal meat hunting that might be considered a form of game cropping, if legalized could be controlled and sustainable with benefits accruing to individuals, a major failure of CBNRM, with most benefits being communal and not contributing to livelihoods.

“It is estimated that as many as 10,000 Impala were taken off private lands around Lake Mburo National Park in a 5 year period (2,000 impala/year) (Lamprey & Mitchelmore, 1996 *In: Barrow, et al.*, 2000). The value of these Impala, approximately \$US 300,000 (US\$ 30/impala), mostly went to a few individuals, including corrupt members of the Game Department. Communities certainly received some share of this value, and also gained access to the meat itself. With the merger of the Game Department and Uganda National Parks in 1996 to form the Uganda Wildlife Authority (UWA), and the accompanying legislation that allows for the granting of use rights, it is reasonable to expect that community benefits from wildlife resources outside protected areas will increase, and may help reduce illegal hunting” (Barrow, *et al.*, 2000).

Hulme (1997) estimates that between 600 and 2,000 impala/year, an estimated 11% offtake (can sustainably harvest about 20% of the annual population), are poached from the greater Lake Mburo area, with bushmeat values of US\$ 27,000 to US\$ 140,000/year depending on values/kg employed. Given poaching of other game, the total annual illegal harvest for bushmeat is valued at about US\$ 150,000 (Hulme, 1997). This implies a population of between about 5,500-18,000

⁴⁰⁶ 1,455 UShs./ US\$ in 1999

impala. Depending on the number of poachers, assuming 100-200, this amounts to between US\$ 750-1,500/hunter.

Never-the-less, there is no reason why such numbers could not be harvested legally and sustainably within the park complex, generating, as with fishing, relatively significant income at the household level.

Averbeck (2001), on the other hand, claims poaching combined with natural deaths is exceeding the annual growth rate of the impala population, causing it to decrease. Her estimates show a decline of impala from 6,599 to about 3,000 in the Lake Mburo area between 1995 and 1999, using fixed-wing aerial surveys using the same method, same pilot and observers (constant error). The latter count of 3,000 impala in February, 1999 was increased from 1,595 to correct for undercounting verified by ground counts that resulted from impala taking cover due to high temperatures (Table 11.12). It should be noted that ground counts and one aerial survey, conducted between 1986 and 1993, showed a range of from 10,993-16,185 impala (Averbeck, 2001).

In the Kruger Park, Bothma, Peel, Petit and Grossman (1990), determined for impala, aerial surveys with a fixed wing aircraft under-estimated the total population by 52-55% and with helicopter between 34 and 64%, compared to a drive count using 59 students as a means of obtaining a total count. If one used these adjustments for undercounting, other than for the February 1999 count that is low, this would put the estimated numbers closer to the earlier ground count numbers. However, estimates of population based on the ground counts might be considered of questionable accuracy, as they covered less than 1.5% to 2% of the survey area (Averbeck, 2001), which many would consider inadequate coverage to have statistically viable data. Lamprey's aerial surveys covered a much more acceptable 11.5% to 17% of the survey area (Averbeck, 2001).

Richard Lamprey (2004a) contends, regardless of the numbers, his counts from 1995 onwards, based on using the same methodology, using the systematic reconnaissance flight (SRF) technique, a method which relies on counting within a systematically obtained sample (Norton-Griffiths, 1978) and having a constant error, show that trends in impala numbers are decreasing and this should be of concern.

“The pastoralists on whose land the wild animals reside perceive them as a problem, and have encouraged local hunting groups to eliminate them. The human-wildlife conflicts are a serious management challenge to local communities, local governments at sub-county and district level and park management” (Lamprey, *et al.*, 2003).

However, if game cropping⁴⁰⁷ is to become a possible management tool, where populations are harvested at near annual replacement rates, then as accurate a figure as possible of the annual population is needed using the latest aerial survey techniques, such as distance sampling, to minimize the likelihood of over-harvesting. If a mistake is made, trend data may pick this up, allowing corrections to be made from which the impala may quickly recover.

The other real problem is that because most of the offtake is clandestine and not monitored, the exact numbers being harvested are unknown, making management decisions difficult. Local hunters need to be brought on board and linked into a systematic program that monitors harvests.

Sixty percent (60%) of the people interviewed in the area hunted and most desired to see local hunting legalized and controlled, since under current conditions

⁴⁰⁷Cropping is the sustainable harvest of meat, skins and other by-products from a game population for economic purposes.

government could not control poaching. Most hunted medium and small game with traditional weapons (nets/dogs/spears, snares, pits, bow and arrow), while only 4% used guns which would allow the taking of large game. With hunting illegal and most people seeing no benefits from wildlife, most did not mind having wildlife in the park, but did not want it as a competitor on their land. The majority saw all wildlife as a problem animal and thus supported poachers coming on their land to eliminate them (Averbeck, 2001).

11.11.2.7 Pilot impala harvesting program

A pilot impala game cropping program was initiated in the vicinity of the park on what appears to be a private ranch. Impala carcasses were sold at US\$ 13 each and tanned skins at US\$ 26/skin. This amounts to US\$ 39 gross/impala. Of this, the community received US\$ 1,100 for 100 impala or US\$ 11/impala (Averbeck, 2001).

Two-thirds (67%) of the impala live outside of the park on ranches in the east and north of the park. It was estimated that 369 impala (123/month over a three month period) for the entire population or 250 on the ranches, could be sustainably harvested/year over a three month period from a 1999 population estimated at 3,370, which includes population growth for that year (Averbeck, 2001); a conservative 11% offtake. Averbeck (2001) estimated an illegal offtake in 1998 of 1,500 impala.

Ultimately, Averbeck (2001) estimated that “considering the investments, the culling of 200 impala might generate less than a net⁴⁰⁸ income of US\$ 8,000 which is financially not viable” due to the small, but limited resource base of the Lake Mburo area. On the other hand, Lamprey, *et al.* (2003) estimate the

⁴⁰⁸ This appears more like a gross value.

possibility of generating a total of US\$ 46,453/year from the game cropping of all wildlife in the Lake Mburo complex. The basic lessons learned from the game cropping experiment were as follows (Lamprey, *et al.*, 2003):

- “Wild animal populations in the country are still too low to allow economical game cropping.
- Meat and skin prices were not sufficiently high to out-compete prices of ‘poached’ meat.
- There is a lack of sufficient scientific data on which to base management decisions (e.g., in deciding quotas, seasons for game cropping, etc”.

Lamprey, *et al.* (2003) found that those ranches with squatters and no title, saw little tangible benefit when revenues were spread amongst many people. On ranches with clear ownership and title, landowners started to support law enforcement programs by reporting illegal activities to park management. This appears, once again, to be the problem. The squatted ranches are analogous to CBNRM programs where the stakeholders are so many that benefits are few/person or head of household. While ranches, with one or a few owners, as game ranches in southern Africa, receive proportionally much higher benefits/individual or household, even if the total amount of money to distribute is the same. Thus, in squatter ranches, poaching benefits individuals with more rewards per those individuals - poachers - than through a communal system of distribution. Land and resource tenure on squatted ranches is also likely a key issue as all over Sub-Saharan Africa.

The culling option has been dropped in favor of a pilot trophy hunting program. The study recommended multiple use of wildlife to maximize economic benefits from added value (Averbeck, 2001) as occurs in South Africa (Table 11.15) including:

- Trophy hunting;
- Processing of skins with hairs on in Uganda;
- Marketing and advertising of game cropping products (e.g., meat, skin, by-products); and
- Furthermore, it should streamline the processes of setting quotas and licenses in time.

Table 11.15: Multiple use of wildlife maximizes profit, South Africa, 2005/2006		
Types Of Business:	Gross Profit US\$/Rand	Percent

11.11.2.8 Pilot hunting scheme

In 2001, a one-year pilot sport hunting project was initiated by a private investor, Game Trails (U) Ltd., in collaboration with a community-based organization – Rurambira Wildlife Society (RWS), consisting of ranches number 46-50, whose main objectives were to (Lamprey, *et al.*, 2003):

- Provide incentives to landowners to manage and protect wildlife on their land by giving wildlife a greater economic value;

- Contribute towards the reduction of crop damage caused by problem animals and vermin; and
- Provide lessons to guide UWA in proposing sport hunting as a conservation concept;

The trophy hunting quota was determined based on a 2-3% offtake of the total population estimate. Game Trails had a joint venture with Zwilling Safaris.⁴⁰⁹

The RWS received 65% of the game (trophy) fees, 5% of the trophy fee went to the Nyakashashara sub-county, 5% to the Community - Protected Area - Institution (CPI): the body (committee) established under UWA policy to act as the link between the protected area and the sub-counties and 25% to the UWA (Lamprey, *et al.*, 2003). The private sector would evidently keep the daily rate, which Booth (2000 *In:* Averbeck, 2001) estimated to be US\$ 81,900, while Lamprey, *et al.* (2003) estimated this would be US\$ 63,000. The following income was derived by the community in the 2001/2002 hunting season (Lamprey, *et al.*, 2003) (Table 11.16).

A 2002 survey showed an apparent increase in impala numbers compared to previous data (Table 11.12), implying that the hunting scheme probably helped decrease poaching (Lamprey, *et al.*, 2003). However, as noted above, Averbeck, (2001) adjusted the 1999 number of impala to 3,000 to account for the time of day and the high temperatures which would have caused a decrease in sightings with impala herds taking refuge in the shade under trees. Has there really been an increase in impala numbers in so short a time (one year)? It is doubtful that one small pilot hunting program on only five ranches, out of what appears to be 60-70 ranches, with limited beneficiaries in such a short amount of time can change the

⁴⁰⁹ The owner of Zwilling Safaris, Peter Pichler, an Austrian died in an automobile accident in 2004 after the hunt of Gerhard Damm (*pers. comm.*), P.O. Box 411 - Rivonia 2128 - South Africa, Tel: +27-(0)11-883-2299 Fax: +27-(0)11-784-2074, email: gerhard@muskwa.co.za

attitude of the entire community towards wildlife to the point that it would result in a significant increase in impala numbers.

Table 11.16: Quota utilization and game fee revenues for the Lake Mburo pilot sport hunting scheme in 2001/2002

Common name	Quota approved	Unit price 'game fee' (\$US)	No. utilized	Potential animals utilized	Potential revenue (\$US)	Potential revenue to community (\$US)	Actual revenue (\$US)	Actual revenue to community (\$US)*
Baboon	15	90	0	1,350	1,013	0	0	0
Buffalo	10	600	6	6,000	4,500	3,600	2,700

Warthog	14	250	9	3,500	2,625	2,250	1,688	
Waterbuck	10	500	6	5,000	3,750	3,000	2,250	
Zebra	31	500	2	15,500	11,625	1,000	750	
Total	187			59,170	44,378	21,030	15,773	

Note*: revenues to communities include to Rurambira Wildlife Society, to the sub-county and to the CPI. This is equivalent to 75% of the game fees.

Source: Lamprey, et al. (2003, Table 4.5) with permission, IFPRI.

It can be argued that if sport hunting is the primary goal of the management program and not game cropping or traditional hunting, estimates of total numbers are not needed since only 2-5% of the population will be harvested for trophies. More cost effective indices such as trophy quality, hunter success and observations of the professional hunter, game scout or community on herd structure and size, recruitment and movement, may be more appropriate for much of Sub-Saharan Africa, including Lake Mburo, unless outside donor money is available. The moment that game cropping and/or traditional meat hunting are brought into the management of an area where offtakes may be much higher

approaching annual growth rates, aerial surveys –with modern “distance sampling” would be advisable at least every three years if money is available.

The Game Trails contract with the Ugandan Wildlife Authority has just been extended for another three years, with plans to open another pilot hunting program around Kabwoya Wildlife Reserve in Hoima with plans to slowly expand to start hunting projects in areas that have high wild animal populations like Luweero, Nakaso-ngola and Mubende. No hunting will be allowed in national parks (Wasike & Tenywa, 2004) and, it is assumed, key game reserves (see Section 11.7.3.2, Eco-welfare Uganda, 2002).

The long-term success of this program will depend on the quality of the trophies and hunter success. Gerhard Damm (2004) hunted the Lake Mburo area in 2004. He saw no shootable buffalo, took some good trophy impala and Defassa waterbuck. Zebra were plentiful. There was strong evidence of illegal charcoal making, with burning all over the place. Some poaching from outsiders was observed. They found a speared bushbuck. Game guards in his camp apprehended three poachers, who came in via dugout canoes, and then shot the poachers’ eight dogs.

Damm (2004) made the following observations regarding the quality of the wildlife and its competition with livestock:

- Herd of about 40 buffalo. Buffalo, coexist with cattle, live in dense bush and close, to swamps, difficult to hunt, trophy quality poor and seem to be over-hunted with non-sustainable quota. Did not see any shootable bull (on quota);
- No lion though, all have been poisoned long ago;

- Impala high density coexisting with cattle, trophy quality excellent (on quota).
- Topi, medium to low density, coexisting with cattle, trophy quality representative (on quota);
- Waterbuck, medium density coexisting with cattle, trophy quality excellent (on quota);
- Eland saw about 150, coexisting with cattle, trophy quality low (bulls not bigger than 33 inch) (on quota);
- Klipspringer, saw a few, (not on quota);
- Duiker, saw a few, (on quota);
- Leopard, saw one, tracks of others (not on quota);
- Bushbuck, seem to be abundant, trophy quality excellent, obviously two subspecies of different color variation; one reddish with longer horns, about 17 inch for reasonable trophy and one grayish with shorter horns about 15 inch for a good trophy, (on quota);
- Bohor Reedbuck, saw a few there should be some good trophies (not on quota).
- Warthog, rather abundant, good trophy quality (on quota);
- Bushpig, very abundant, (on quota);
- Sitatunga, saw signs and picked up a horn, (not on quota);
- Zebra, very abundant, high density, too many, black/white no shadow stripes, (on quota);
- Oribi, saw a few, average, (on quota); and
- Hippo, did not see, but are there. Shot as crop raiders (on quota).

Ogwang and DeGeorges (1992) noted regarding buffalo populations that

"Due to over-grazing, primarily by livestock within the park, the make-up of the grasslands has been significantly modified from nutritious grasslands dominated by:

- *Themeda triandra*;
- *Hyparrhenia filipendula*; and
- *Sporobolus pyramidalis*.

to the less nutritious and less palatable *Brachiaria decumbens*. While Impala, Zebra, oribi and duiker will eat *Brachiaria decumbens*, buffalo will not. This may be one of the primary reasons why buffalo are among the most reduced of all the game in the park. Buffalo are sensitive to high human/cattle disturbance. While Bahima tolerate most wildlife species (except predators), they are negative in their attitudes towards buffalo. It has also been found that because overgrazed areas neither shade out nor provide the hot fires necessary to control its abundance, Acacia spp. takes over in these areas (bush encroachment). Acacia appears to have a symbiotic relationship, favoring the shade tolerant *Brachiaria decumbens* over other grasses (Guard, *pers. comm.* In: Ogwang & DeGeorges, 1992). Also, low value lemon grass, *Cymbopogon afronardus* is taking over in some areas, especially on ranches around the park".

Based on the above information, it is unclear about how successful this hunting operation will be until it produces quality buffalo, which will be the flagship money-making species that will attract high-paying overseas hunters. This appears to be a transition area, with Cape buffalo, while lacking Nile buffalo and most of the other "Nile" species found around Queen Elizabeth National Park and other western Ugandan savanna parks and reserves, such as Murchison Falls (see Chapter 9, Section 9.6.3.9, Community fisheries management, Queen Elizabeth National Park, Uganda). According to Damm (*pers. comm.*),⁴¹⁰ the waterbuck here is the Defassa, replacing the common waterbuck of East Africa, while the

⁴¹⁰Gerhard Damm, P.O. Box 411 - Rivonia 2128 - South Africa, Tel: +27-(0)11-883-2299 Fax: +27-(0)11-784-2074, email: gerhard@muskwa.co.za

East African impala has yet to be replaced by the Ugandan Kob of western Uganda. Thus, this area is also not the ideal spot to attract specialty hunters after the unique species of western Uganda.

“The issues and lessons arising from the pilot sport hunting scheme include the following (Lamprey, *et al.*, 2003):

- If owners of private land can realize economic value from wildlife, they develop a positive attitude towards conserving it.
- Given the complexity of the hunting issue, and the criteria for issuing a hunting WUR (Wildlife User Rights), it is unlikely that landowners themselves can obtain hunting rights for their own land. Instead, individual operators may obtain the WUR, and then apply to hunt on other peoples land.
- The hunting company has a real incentive to ensure that the wildlife population remains at a viable level for them to hunt. They therefore have introduced anti-poaching patrols in the ranch areas, and these are proving to be effective in curbing poaching.
- Sport hunters are not interested in species that are ‘problem animals’. No client has wanted to shoot baboons or bushpigs. Sport hunting will not be useful for Problem Animal Control (PAC).
- The operational area of the scheme is still small; the majority of the residents feel neglected and discriminated against. However, the scheme can only be introduced in areas where wildlife remains.
- Mechanisms for sharing revenues amongst landowners are not yet in place. The Rurambira Wildlife Society has instead used revenues for general community projects (e.g., schools).
- The roles of the districts (Rakai and Mbarara) and community PA (Protected Area) institution in the management of the project have not yet been clearly defined”.

A key question that must be asked is how much more can this quota be increased if the hunting was expanded to all the ranches? If one compares the populations of key species in Tables 11.12 and 11.16, assuming a 2% offtake of the annual population for trophies, there is limited room for currently expanding trophy

hunting in the area if trophy quality is to be maintained. Likewise, there is a problem if revenue from trophy hunting of US\$ 15,773 were split among individual heads of household on the 60-70 ranches, many of which are communal or full of squatters. The amount becomes insignificant.

When Dr. Lamprey was queried as to what benefits from hunting meant at the level of household, he responded with what is being observed over and over again in CBNRM-type programs based on the very narrow use of the resources; trophy hunting:

“I am not sure how many households are in the Rurambira scheme, the UWA report from which the data came does not say. I can try to find out - possibly from the 1999 census, which goes down to parish level. Also note that there are many in Rurambira who are squatters on ranches, and have no land of their own. So are they valid beneficiaries? My guess is that each household will be able to buy a couple of bananas for what they actually get annually from the hunting scheme, and that a bit of illegal hunting is far more profitable” (Lamprey, 2004b).

As discussed in Chapter nine, in most cases CBNRM has little impact at the level of households, whereas if one would allow individuals to access a variety of natural resources on a controlled and managed basis, there would be more of an impact on household incomes. Thus, if one combines fishing, traditional hunting, grazing of livestock, wood and other products, plus trophy hunting, there is no reason why these areas cannot be managed for multiple uses, maximizing the income to local residents. “Specialists” from various families would likely access these resources, as within most African communities there is a division of labor, though this would have to be negotiated by all stakeholders. In the long run, it may be the only way to save many of Africa’s natural areas. Certainly, CBNRM, as currently practiced, with an emphasis on trophy hunting, is not the solution.

There is no reason that the remaining ranches, many with squatters, should change their attitudes towards wildlife. Nor is there reason to think that this small percentage of ranches benefiting would be able to stop the other ranches with no benefits from allowing entrepreneurial “poachers” to hunt on those disadvantaged ranches, unless they are all brought into the management of the Lake Mburo complex. Certainly helping a small percentage of landowners will not endear sport hunting and conservation to the remaining residents of the greater Lake Mburo area.

Furthermore, the amount could be significantly increased if the community formed its own safari company and could keep the daily rate, working through a booking agent who might keep 15% of this rate. Even then, while it may be fine for an individually owned company, how significant would this be for a community at the household level, even if one could triple/quadruple the income by cutting out the middleman? Once again, very likely not very significant, though it could serve as a catalyst for development of the area and to provide educational scholarships for youth from the area (see Chapter 9, Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders).

Community conservation at LMNP has been based on a “passive participation” approach also called “protected area outreach”. The ultimate challenge for community conservation in Uganda will be whether the Uganda Wildlife Authority (UWA), which encompasses the old Uganda National Parks and the Game Department) funds it as a core activity when donors withdraw, or whether it is treated as a donor-financed “luxury” that will be abandoned when the aid flows stop (Hulme, 1997) with a return to an easier-to-implement paramilitary approach which separates people from their resources. This will be an issue for all of

Uganda's protected areas, not just Lake Mburo. Barrow, *et al.* (2000), raise similar concerns,

"UWA's failure to invest in community conservation is of concern, as it makes the sustainability of many donor funded initiatives uncertain. Consistency of approach is critical to successful community conservation, and this is only likely to come about if UWA clearly makes community conservation part of its program, and provides an operational budget for it, both at headquarters level and within the individual protected areas".

Some key points to be observed here are that: 1) Ecotourism, unless the area is very unique, often does not generate significant income given the demands of peripheral communities and even park management, 2) Using the park or game reserve as a "Living Factory" has a better chance of providing a multitude of income generating activities which, when all of the income is combined, may begin to be significant. This could include traditional hunting, trophy hunting; culling; fishing, livestock grazing, charcoal making, timber harvesting and medicinal plant harvesting among others; 3) A short-coming of most CBNRM programs is that they tend to favor a very narrow focused use of the resource through safari hunting and ignore the entrepreneurial skills of individuals such as fishermen and traditional hunters (so called "poachers"), etc. If there is a failure to integrate these resource users into the formal management of a protected area, then sustainable use, using adaptive management techniques, will be impossible since the resource manager will be unable to monitor the offtake, judge the consequences to the harvested population (be it fish, trees, wildlife or medicinal plants) and then adjust offtake quotas to assure both economic and ecological sustainability. This is a major weakness in most CBNRM projects; 4) Unless resource use can be maximized from many protected areas, with or without the support of the parks and wildlife departments, communities will likely opt out of natural systems in favor of agricultural systems, 5) If wildlife and its habitat is to

have a chance of surviving, the majority of the benefits must accrue to the landholders/community as opposed to the government and private sector who can be economic partners and 6) In some instances, possibly in the case of Lake Mburo National Park, agricultural systems in the long-run may out-compete natural systems.

Given the current wave of poverty in Africa, with populations expected to increase about three times in the 21st century, it would be wise to identify natural systems that can pay for themselves and work with communities to maximize benefits both at a communal and individual level. It is no use fighting a losing battle. In certain incidences, such as areas of unique biological diversity, beauty or cultural heritage, it may prove worthwhile to the global, national or local communities to preserve certain natural environments regardless of the cost. These areas also need identifying.

11.11.3 Rwenzori Mountains National Park - A Success Story of Rural People Managing a Natural Area, and then Foreign Aid and NGOs Arrived

Until USAID forced Uganda to declare the area a national park, and then funded WWF to move into the Rwenzori Mountains, “the Mountains of the Moon”, a model Stage 4 CBNRM program existed or “Conservation by the People” (see Chapter 9, Section 9.8, THE WAY FORWARD – CONSERVATION BY THE PEOPLE – STAGE 4 EQUALS DEVOLUTION). Even USAID-funded auditors were impressed with the Rwenzori Mountaineering Services (RMS) accounting records and with how transparent they were. RMS is an indigenous backpacking and mountaineering tourism company. Sadly, it was USAID who helped jump-start this program and then, in the principal author’s opinion, stepped in and derailed it.

Up until about 1991, when gazetted as a park, the Rwenzori Mountains "Mountains of the Moon" were managed as a forest reserve. For the most part, there was little active management of this forest, with the exception of some pit-sawing permits given out by the Forestry Department.

11.11.3.1 Indigenous controls

For the most part, the protection and the development of the Rwenzori Mountains can be tied to their ruggedness and inaccessibility, but most importantly to the integral link between the Bakonjo people and these mountains, both from the standpoint of resource use (firewood, timber/pit-sawing, gathering of honey, fiber for handicrafts, medicine, food, trout fishing, hunting, etc.) and culture (much of their folklore revolves around the "Old Man of the Mountain" and his son the "One Legged Shepherd", to whom sacrifices must be made prior to the hunt. It is believed that this program can be considered a success story in conservation and development because (Ogwang & DeGeorges, 1992):

- Ownership and Implementation was in control of the local Bakonjo Community;
- Initially, external financing was introduced from the outside, only to jump start the process, but with minimal interference from Western donors and NGOs;
- Community was allowed to make its own decisions and mistakes and learn from this experience;
- Sustainability came from income generated from the resource base; ecotourism in the Mountains of the Moon; and
- All income stayed within the community, including employment and development.

One factor in their favor is that this community goes back a number of generations acting as guides into these mountains under the colonial Uganda Mountaineering Club. Constraints include:

- Declaring the area a park, which by the 1953 Parks Act made this an exclusion zone;
- Beginning to impose Western NGOs on the local people once a park was declared; WWF; and
- Negative Impact on Giant Heath Forests as source of firewood – and need to walk-in alternative energy sources from the outside;

11.11.3.2 RMNP, ecological setting

The 99,600 ha Rwenzori Mountain National Park includes Africa's third highest peak (Margherita, 5,109 meters) with a further 25 of the peaks above 4, 500 meters. Of the 278 woody plant taxa found in the afro-alpine zone, 81% are endemic to east Africa and 19% are found only in the afro-alpine belt (UNEP, 2004). Decreasing temperatures with increasing altitude has resulted in a marked zoning of vegetation which is of great interest to scientists and a delight to visitors. These zones may be summarized as follows (Yeoman, 1989; Yeoman, Tinidigarukayo & Aryamanya-Mugisha, 1990 both *In: Ogwang & DeGeorges, 1992*):

- Below 2,100 meters (7,000 ft) the Forest Reserve Boundary): steep foothills with cultivation and fire induced poor quality grassland subject to soil erosion and reduced fertility;
- 2,100 to 2,400 meters: Mixed broad-leaved and *Podocarpus montane* rain forest of moderate height of 24-31 m (80-100 ft);

- 2,400 to 3,000 meters: a zone in which either *Mimulopsis elliotiae* (a straggling semi-shrub) or bamboo dominate or a mixture of the two;
- 3,000 to 3,800 meters: giant tree heathers (*Phillipia* spp.) carrying aerial epiphytic gardens of outstanding botanical and aesthetic interest, some of which are unique to Rwenzori only;
- 3,800 to 4,500 meters: Climax types of giant lobelia (*Lobelia bequaertii*) and giant groundsel (*Senecio johnstonii* subsp.) that demonstrate the extraordinary phenomenon of afro-alpine gigantism. This is a response to a diurnal regime of intense daily insolation alternating with night freezing. These gigantic species are to a great extent the hallmark of the Rwenzori “Africa's botanical big game”. In this zone *Alchemilla* spp., *Carex runssoroensis* (in bogs) and other tussock grasses provide much of the ground cover, while Everlasting flowers (*Helichrysum* spp.) cover immense expanses of the mountain sides; and
- Above about 4,500 meters (the approximate permanent snow line): the nival zone carries diminishing hardy vegetation which is progressively miniaturized until the permanent ice fields are reached, with the highest point of Mt. Stanley at 5,100 meters (16,700 ft). Unique massive ice-rime sculptures surpass the beauty of equivalent zones of Mt. Kenya and Kilimanjaro.

The park contains at least 89 species of forest birds (27% of the country's total), four species of diurnal primates and 15 species of butterflies (22% of the country's total). Although none are unique to the Rwenzori, many are endemic to the Albertine Rift region and a high level of sub-specific endemism occurs, including the Rwenzori colobus monkey, hyrax and leopard. Although in low numbers, globally threatened species in the park include: elephant (*Loxodonta africana*), chimpanzee (*Pan troglodytes*) and l'hoests monkey (*Cercopithecus l'hoesti*) (UNEP, 2004).

Runoff from Rwenzori enters into Lake Edwards and Lake George, flows into the Semliki River, Lake Albert and then the White Nile River System. In addition to its unique biological diversity, other values include flood control, indirectly lake fisheries, hydropower, reliable permanent headwater for the Nile River, plains irrigation, potable water and tourism.

11.11.3.3 Rwenzori Mountaineering Services (RMS)

Up until about 1991, when the first park warden was placed at park headquarters in Ibanda, the real developer of these mountains was the Rwenzori Mountaineering Services (RMS), an indigenous Bakonjo NGO that had been receiving support from USAID since 1987 through PL-480 (Food for Peace) local currency. This entirely indigenous-based operation guides hikers and alpinists on expeditions into the “Mountains of the Moon”. Since this was a community business, there was close cooperation and a vested interest by everyone in developing the business and in protecting the Rwenzori Mountains. Farmers in the area had sold their lands to RMS, who in return donated this land, situated between RMS headquarters and the national park boundary, as a site for the Rwenzori Mountains National Park headquarters. As of 1992, RMS had undertaken the following activities (Ogwang & DeGeorges, 1992):

- Employed 22 permanent staff, 63 guides/porters who did piece work and 100 laborers helping in construction and renovation of headquarters and trail shelters (4 -5), pit latrines and garbage pits. These people were drawn from four sub-counties and many families;
- Construction of RMS and Parks Headquarters;
- Construction of a dispensary, with some money from the German Government;

- Expansion of the Rwenzori High School. The community made the bricks and RMS helped in hauling sand, cement and provided tin roofing, nails and timber. The school and its grounds are quite impressive;
- Construction of a hotel/restaurant next to headquarters;
- Providing land for park headquarters; and
- About seven camping shelters strategically located throughout the park, each about a day's walk apart.

The RMS had an office in the town of Kasese. You can arrive with the clothes on your back. The RMS will find you winter clothes from the overseas used-clothes market, gumboots and food. They will transport you to Ibanda, the foothills and the gateway to the Mountains of the Moon, lodge you and organize porters, cooks and guides. Thus, they provide door-to-door service as outfitters into these mountains. Even if you desire to climb the glaciers, they have crampons and all the other mountaineering gear you may require. In 1991, 1,400 visitors climbed, experiencing the natural beauties and unique culture of these mountains. Unfortunately, in the late 1990s and early 2000s, instability and rebel movements along Uganda's borders, including the Rwenzoris, have kept tourists from coming.

Based upon extensive interviews with the inhabitants of the Rwenzori Mountains (Yeoman, Tinidigarukayo & Aryamanya-Mugisha, 1990 *In:* Ogwang & DeGeorges, 1992), the following was recommended:

1. Core Zone of 483 km² in upper reaches of mountains with unique biocoenoses (specialized and characteristic associations of plants) and high levels of endemism be transferred from the Forest Department to National Parks as a “core area” (Note: this is in the flavor of a biosphere

reserve). An inselberg or biogeographical island with significant number of endemic fauna and flora. This would be a protected area.

2. Balance of the Forest Reserve (513 km^2), which contains 80% of the conventional forests of interest to foresters, should remain as a Central Forest Reserve under the Forest Department functioning as a buffer zone. The lower area could be used for subsistence and other economic purposes.

Unfortunately, pressure from the U.S. Government and Western NGOs resulted in the entire area being declared a national park and an exclusion zone. Regardless, according to a Cabinet Memorandum, “Creation of a new National Park will not interfere with local interests (e.g., Movements of people, wood and bamboo cutting, hunting, etc”. (Yeoman, Tinidigarukayo & Aryamanya- Mugisha, 1990 *In: Ogwang & DeGeorges, 1992*).

Indecisiveness by the parks Board of Trustees over the above issue led to confusion and became the root cause for growing friction between Rwenzori Mountains National Park (RMNP) staff, and the local community and the Rwenzori Mountaineering Services (RMS).

Upon the arrival of the study team⁴¹¹, the RMNP Chief Park Warden⁴¹² called a meeting of his staff, the Rwenzori Mountaineering Services (RMS), the local Resistance Committee/Council (RC) chairmen, RC1, RC2 and RC3⁴¹³ from Bugoye Sub-County, and the Chief Technical Advisor⁴¹⁴ from the USAID/WWF-

⁴¹¹ Author was part of team along with David Abura Ogwang, Chief Planner, Ministry of Wildlife and Tourism, P.O. Box 4241, Kampala, Uganda in 1992 - today manages the GEF funds.

⁴¹² Alfred Labongo.

⁴¹³ Tom Ruwerza, RC1, Buyoye; C. Kule, RC2, Information, Ibanda; B. Muhongy, RC3 Chairman, Bugoye Sub-county.

⁴¹⁴ Earl P. Clere, Technical Advisor, Rwenzori Mountains Conservation and Development Project, WWF-US.

U.S. Rwenzori Mountains Conservation and Development Project. The Chairman of the Rwenzori Mountaineering Services (RMS), Bwambale M. Johnson, explained that there was a lot of confusion and conflict over how to use the park. The Secretary of RMS, Mwanamwolho M. Stanley, explained that these mountains have been seen as government land since the colonial days, when gazetted as a forest reserve. The Secretary of the RMS explained,

“ ‘Now the Chief Park Warden has come in and is giving out orders such as ‘Don’t do this or that’, locals can’t go into the park, only tourists—the old colonial line! People have no idea of what a national park is, nor an understanding of park policies other than antiquated 1953 colonial park laws which don’t make sense in 1992’ ” (Ogwang & DeGeorges, 1992).

They had always wanted a park, but, as described above, with an upper core protected area reserved for tourism and a lower multiple-use area for extraction of resources by community members. What the Bakonjo people needed to know was (Ogwang & DeGeorges, 1992):

- How could they effectively manage “Their” natural resources? Even though recognized as government land because of economic and cultural ties, the Bakonjo will always feel that the Rwenzori Mountains and its resources are theirs. This is the type of sentiment that all conservation projects should strive for among the local people if they are to be considered a success.
- For a long, time boundaries were forgotten during the civil strife, yet the people still respected the integrity of the forest. The boundaries need to be re-demarcated.
- People needed to be allowed to undertake traditional activities necessary to subsist, for cultural purposes or to gain a livelihood including, but not limited to: firewood, honey, fibre for handicrafts, trout fishing, hunting,

pit-sawing and medicine – that would mainly occur in the lower proposed multiple use area.

Plus, RMS should continue being allowed to guide people. Leaders from the community told the warden that if he did not collaborate with them, he would be sent back to Kampala, an empowerment given them by the new bottom-up government of President Yoweri Kaguta Museveni.

The Chief Warden explained that he feared encroachment in the park by cultivators and livestock. The Bakonjo explained that farms in the upper reaches of the mountains were being abandoned by the youth as their parents died, the youth preferring to be nearer the bright lights and the major thoroughfares of the urban setting. This was a non-issue.

It was explained that park boundaries cannot be realigned, but it would be possible to develop multiple use areas within the park. The USAID/WWF U.S. Chief Technical Advisor explained that at the time there were no serious problems with the park. He hoped that it could be kept this way in the Rwenzoris. He explained how he told the Minister of Environmental Protection, under which his project fell, that policies would come from below and not from above; that is to say from the Bakonjo and the Resistance Committee/Council (RC) chairmen - local government). It would be interesting to return today to see how an area that was a Stage 4 CBNRM program, autonomously run by the local community, turned back into a Stage 3 with a lot of outside interference, has progressed; forwards or backwards? The real question that needs to be asked is did the private-sector not-for-profit community-owned and operated Rwenzori Mountaineering Services (RMS) need some expatriate-NGO holding their hands and wasting what little development money is available in overhead and expensive expatriate salaries, or

some park warden imposing nonsensical bureaucratic requirements on them from antiquated laws? They were doing quite well on their own, thank you.

The only real problem that the principal author observed was the burning of heath forests and other vegetation in the upper core protected area of the park when taking clients on treks. RMS personnel were well aware of this and were making plans to hull up bottled gas and/or firewood.

According to UNEP (2004), traditional uses of forest resources, which were permitted under the former Forest Reserve, have mainly been carried out on a sustainable basis and new agreements have been made respecting these harvesting rights. It is claimed that hunting has stopped possibly due to lack of game.

According to Barrow, *et al.* (2000),

“the process of development of MOUs (Memorandums of Understanding) for forest resource access was carried out with groups representing resource users resident in communities defined by ‘spurs’ (groups living along specific ridges or different sections of the mountains)...UWA is fraught with institutional, structural, organizational and financial problems and constraints which have made this a difficult goal to achieve”.

The agreements were negotiated in a participatory manner and gave management responsibility to the communities. However, two years after being agreed on, the MOUs had not been officially sanctioned by the Uganda Wildlife Authority (UWA) (Barrow, *et al.*, 2000). The WWF East African Programs website shows the following objectives for the Rwenzoris (WWF, 2004a):

“Phase I

1. To assist in the development of policies and regulations, including a park management plan, involving participation of key stakeholders.

2. To reduce the communities' pressure on the park through the identification and promotion of alternative natural resource management activities (Does this mean failed integrated rural development?).
3. To increase the levels of conservation awareness and to improve attitudes of area residents to enable them to make informed decisions regarding sustainable natural resource management.
4. To strengthen local institutional capacity, including decision-making abilities (Park Management Advisory Committees, community-based organizations, etc.) for resource management and development activities.

Phase II

1. To strengthen the capacity of Rwenzori Mountains National Park to effectively manage the park.
2. To reduce human pressures on the park and help meet subsistence resource needs.
3. To strengthen the relations between the park and communities”.

You could take the name of Rwenzori Mountains off these objectives and they would become the generic quick fix for conservation by NGOs all over Sub-Saharan Africa that is ultimately used to impose Western conservation values on other cultures, often impoverishing the people, as many of the case studies in this chapter and Chapter nine have shown. Rhetoric and action are often at opposite ends of the pole.

11.11.4 NGOs and Eco-Colonialism in Bwindi National Park (BINP), Uganda

Bwindi, The 331 km² “Impenetrable Forest” was previously managed as both a forest and gorilla reserve.

“Bwindi is one of the richest afromontane forests in East Africa for birds (350 species) butterflies (310 species), reptiles (51 species) trees (200 species), moths (53 hawk moths and 35 of silk moths species) and the highest diversity of small mammals amongst the

African forests. Bwindi's mammal fauna is also rich; 120 species have been recorded, including 7 species of diurnal primates" (Makombo, 2003).

Bordering Bwindi are some of the richest agricultural lands in Uganda, but among the most populated.

"In 1948 there were 3.7 ha/person while today there are 140-500 persons/km² and an average of only 0.7 ha of land available per person. Formerly steep sloped forested areas are now under intense cultivation" (Ogwang & DeGeorges, 1992).

The human population density on the edge of the park is 200-400 per km², among the highest densities on the continent, resulting in a major out-migration (Wild & Mutebi, 1996). People practice terraced agriculture (see Chapter 5, Section 5.6.1.8, Impacts of colonialism on traditional agriculture in Uganda).

The Forest and Game Departments managed the forests under the Forest and Game Acts of 1964. Bwindi had a Forest Department Working Plan. As a forest reserve, timber exploitation was limited to "restricted species", felled by licensed pit sawyers. The Forest Act of 1964 made provision for the local use of minor forest products. However evaluations in the mid-1980s indicated that pit-sawing (both legal and illegal), gold mining, beekeeping and hunting were out of control (Wild & Mutebi, 1996).

Pit-sawing was the major source of income from the forest and ecologically benign. A single tree is cut, a pit dug, and with a two-man saw - one man on the tree and one in the pit - boards are made on the spot and carried out on foot paths. It is labor intensive and no logging roads are needed which fragment the forest and open it to uncontrolled access, as in Cameroon (see Section 11.11.6.4, Logging companies and the unsustainable bushmeat trade) and the Congo (see

Section 11.11.7.3, Collusion between WCS, CIB and unsustainable logging/conservation). During 1990, evaluations

“stressed the need for local people to gain practical benefits from a zone (buffer) of the forest allocated for multiple-use sustainable extractive activities” (Ogwang & DeGeorges, 1992):

- 37% of population interviewed carried out pit-sawing in the past, the majority being employed by larger contractors;
- 8 % interviewed were employed through timber carrying;
- 13% of respondents produced items for sale from the forest such as baskets, trays, walking sticks, honey, grain stores, carved utensils, stools, furniture, etc.; and
- 69% interviewed had woodlots, but land shortage is the biggest hindrance to expansion.

For the most part recommendations were ignored. One problem the principal author found in the early 1990s was that the local communities alleged

“that pit-sawing permits are issued to rich saw millers, who can afford to pay off those issuing the permits. These millers use their own pit sawyers. The local communities perceive that they fail to derive major benefits from pit-sawing, working primarily as day laborers hand carrying boards from the forest to the benefit of a few relatively far removed entrepreneurs. Most local inhabitants cannot afford the UShs 45,000 to invest in a saw” (DeGeorges, 1990a).

This could easily be overcome by giving exclusive rights for logging only to peripheral communities.

According to Hamilton (1987 *In:* Ogwang & DeGeorges, 1992),

“Conservation of many forests species is likely to be compatible with timber harvesting, especially if this is by pit-sawing...In fact pit-sawing does have some advantages over saw milling, notably in providing more jobs, avoiding much of the disturbance, compaction, and erosion of large areas of topsoil which are associated with saw milling, and quite likely in allowing a higher sustainable harvest of timber...not arguing that sawmilling should be replaced entirely by pit-sawing-only that the Forest Department should reassess its priorities in this area”.

11.11.4.1 Turning Bwindi into a national park, donor/NGO pressures

Rather than working to manage these resources better, with pressure from gorilla researchers such as Tom Butynski and Jane Kalina, and associated Western NGOs,⁴¹⁵ the U.S. Government pressured Bwindi’s designation as a park in 1991, against the desire of the surrounding rural populace, to protect 300 IUCN “Critically Endangered” mountain gorillas (*Gorilla gorilla beringei*). According to Vande weghe (2004), Butynski was against gorilla viewing by tourists, since the benefits to communities were so low compared to the high risk of disease (e.g., bronchial pneumonia and measles) transmitted from humans to gorillas, or even gorillas to man such as herpes. This reluctance to develop gorilla tourism is believed by the principal author to be the primary reason Dr. Butynski was eventually forced out of Bwindi in the early 1990s. Large sums of donor funding, especially from USAID, were funneled to CARE to deal with people outside the forest (DTC – Development Through Conservation Project) and WWF (IFCP – Impenetrable Forest Conservation Project) to deal with issues within the forest. The principal author found the approach of CARE and WWF back in the early 1990s, both amusing and alarming. WWF game guards, dressed in green shirts and hats, carrying rifles, were seen by the community as the “bad guys”, keeping

⁴¹⁵ Tom Butynski and Jane Kalina were working in Bwindi funded by USAID through WWF. Tom and Jane (*pers. comm.*) were against both consumptive use (e.g., pit-sawing) and non-consumptive use (e.g., gorillas tourism). When they had to leave, WCS moved in and established gorilla tourism, since they already had experience in habituating gorillas and tourism in neighboring Rwanda.

them out of the forest. While on-the-farm outside of Bwindi, CARE community game guards were dressed in white hats and white shirts and supposed to be “good guys” helping the community with agro-forestry, living fences, etc., solving most of the developmental problems on the farm (failed integrated rural development – see Section 11.10.6.2, “Conservation and development” a continuation of failed “integrated rural development” linked to “preservation”); almost like a cowboy movie – the good guys wore white hats (Ogwang & DeGeorges, 1992).

11.11.4.2 Reaction of rural people to Bwindi National Park

The 1965 Parks Act prohibited people prohibited from entering the park, an exclusion zone. When Dr. Fred Kayanja, Trustee of the East African Wildlife Society and Vice Chancellor of Mbarara University of Science and Technology, explained to the people that they would be compensated for not being able to use the Park's resources by having schools, clinics and roads built for them, the local community explained, that the forest yielded resources that provided money, though little by our standards, to many heads of families.

As one pit sawyer explained,

“Your schools, clinics and roads are well and good, but they don't fill empty bellies or pay school fees. We want access to the forest” (Ogwang & DeGeorges, 1992).

Wild and Mutebi (1996) site similar reactions from local communities. Bwindi is a fine example of the failure of CBNRM programs to positively impact heads of households, in fact its implementation was making households poorer (see Chapter 9, Section 9.7.6.4, CBNRM will not create a “middleclass” in rural Africa).

Many villagers and loggers explained that for them the gorillas were another form of human, which they respected and did not poach. Given what they feared then became a reality as all pit-sawing, a major source of rural income, was stopped even though there was little scientific evidence that this means of exploitation was harmful to gorillas or the forest, nor incompatible with ecotourism - providing a more diverse portfolio of resource utilization with greater economic returns (Ogwang & DeGeorges, 1992).

11.11.4.3 Impacts on Bwindi's natural system from excluding people

In fact, in the book *The mountain gorilla: Ecology and behavior* by Schaller (1976), it was suggested that with the disappearance of the forest elephant, some pit-sawing could be beneficial to the gorillas by opening up the forest and providing the luxuriant vegetation they needed for food. What Schaller failed to mention is that until the coming of the European and his 7th century Norman concept of exclusion zones (see Chapter 3), people have always played a pivotal role in determining the ecology of the Impenetrable Forest and most other ecosystems in Sub-Saharan Africa. Now that key mega-fauna are extinct from the forest, a person's role, contradictory to what most people think, becomes that much more critical if the gorilla and its habitat are to survive. Wild and Mutebi (1996) explain,

“At Bwindi the activities of buffalo (now extinct) and elephant (now very few) caused disturbed secondary habitats which gorillas prefer. Secondary vegetation is now common in the forest due to timber harvesting. With better protection the forest is regenerating, and gorilla habitat is likely to decline. The level of plant use (see below – minor forest products) established at BINP is far below the impact needed to maintain secondary habitats at their present extent and causes less vegetation destruction than tourist trails cut daily for gorilla viewing”.

In fact, in many instances, separating people from their natural resources is resulting in decreased biodiversity (Wild & Mutebi, 1996), similar to allowing habitat to evolve to a few climax species by removing fire in savannas (see Chapter 6, Section 6.1.4.4, Bush encroachment versus desertification), and in this case, logging.

Furthermore, “A policy of no use can bring greater risk to an ecosystem where communities depend on the resources. The hostility caused by cutting off these resources can be an extremely risky strategy, as has been proven time and again in recent conservation history. Aggressive protection is vulnerable to failure at ‘crisis points’ when law enforcement fails” (Wild & Mutebi, 1998).

This is the danger faced with the conservation program that does not allow timber harvesting that some ecologists feel would be beneficial to both biodiversity and in providing food and habitat for the gorilla if undertaken in a controlled and sustainable way.

“Under pressure from traditional Western conservationists, who had come to believe that wilderness and human community were incompatible, the Batwa were forcibly expelled from their homeland” (Dowie, 2005).

Excluding Batwa Pygmies from Bwindi without options for alternative livelihoods has been disastrous:

“I am from Nteko, nearby the forest. A long time ago we used to stay in the forest where we used to get everything. We reached the time of seeing people coming and they told us to come out of the forest, that it’s not yours, you go out of it into the open area. We went out and we couldn’t fit in any community. We reached the place and stay there just working for others up to now. We struggle to get the way of surviving. The people who chased us from the forest haven’t given us anything to survive on. We need land and hoe. If they are not ready to help us in that - they are to explain to

us whether they can let us go back to the forest" (*In: Colchester, 2003*).

A land acquisition program for the Batwa Pygmies was begun, but stopped, allegedly due to the poor performance of the Trust Fund in U.S. stock markets (Colchester, 2003) (see Section 11.11.4.4, Benefit sharing).

Retaliation by local people for the creation of Bwindi Park resulted in 16 fires started during a drought following the gazetting of BINP. Roughly 5% of Bwindi Forest burnt, including some areas that had never burnt before. With a boundary of about 115 km and a patrol staff of 24, management of the park without the support of peripheral communities was impossible. During one of the management plan workshops for BINP, one of the community representatives said:

"The reality is, no matter how many rangers you have, you will not be able to control people going into the park. Timber is coming out of the forest even now" (Wild & Mutebi, 1996).

Interestingly enough, prior to Bwindi becoming a park, the forest boundaries, planted in exotic cypress trees, were respected by the local over-populated communities, with one exception where a forest guard had given permission for one group to cut into the forest for agriculture. Given the human population pressure for agricultural land, a forest whose resources are worth little to local people, risks to be encroached on.

11.11.4.4 Benefit sharing

According to Makombo (2003),

“The revenue sharing money, which is usually 20% of the total gate entry collections (mostly for gorilla viewing), is paid to the sub-county local government level in check form and the sub-county administration integrates it into its budget. However, the money goes directly to support projects within the parish that touches the Park as it is the residents of such parishes that bear the costs of Park existence, especially crop damage by animals...So far, Bwindi has supported 19 successful projects around the Park that took a sum of USH 71 million (\$US 71,000) by 1999. More funds (USH. 90,000,000 an equivalent of \$US 52,950)⁴¹⁶ have been disbursed”.

If all of this money is added up, it amounts to only US\$ 123,950 that has gotten to communities in the form of projects since the park’s inception in 1991, or about US\$ 10,329/year over 12 years. This money goes to common property benefits and does not help individual families, a recurring symptom of most CBNRM programs (see Chapter 9).

However, the share of revenue for community benefits from gorilla watching amounts to around US\$ 100,000/year around Bwindi (Clarke, 2001). Based on the figures given above in Makombo (2003), little of this income, maybe 10% is actually even getting to community projects let alone heads of households. A sizeable sum, but had it been shared out between the 80,000 inhabitants of the parishes identified as beneficiaries, each person's share would have been a US\$ 1.25/year (Clarke, 2001; Clarke, 2004), or about US\$ 7.50-12.50/household depending on the average size of each household (e.g., assuming six to ten persons/household).

⁴¹⁶This is quoted – must assume fluctuating exchange rates account for differences in conversion to US\$.

Another benefit is the US\$ 84,000 annually in park staff salaries to people from the neighboring communities. Another US\$ 12,700/year is earned by the communities as guides, especially popular with students during vacation (Makombo, 2003). Numbers of beneficiaries or households impacted positively by employment were not provided. The communities around park headquarters at Buhoma have a guest camp that also raises some money (Makombo, 2003).

Cunningham (1996) provides an excellent review of major and minor forest products from Bwindi, except timber. It appears that some access to non-timber products is being allowed within 20% of the park (Adams & Infield, 1998; Wild & Mutebi, 1996). According to Barrow, *et al.* (2000),

“As part of the statutory process of consulting with communities prior to national park declaration, Uganda National Parks (UNP) was forced to accept that it would continue to allow access to resources by local communities. As a consequence, UNP (Uganda National Parks) responded by developing an informal policy that ‘up to’ 20% of national parks could be subject to extractive resource use. This amounted to a radical departure from national policy, and put Uganda at the most extreme edge of national park management in Africa, where strict, exclusionary management is still generally the order of the day”.

Bushmeat and timber harvesting, though not allowed, could provide major sources of income and the meat could supply an important source of protein if sustainable harvesting programs were developed (Table 11.17).

Table 11.17: Negotiated approval of minor forest products to be harvested by communities from Bwindi National Park

	Allowed	Under Consideration	Not Allowed

For instance, in the Aberdare Forests of nearby Kenya, Emerton (1996, *In: Barrow, et al., 2000*) found household income from the diversified use of the forest resources to be significant (Table 11.18):

Table 11.18: Average annual household value of timber and minor forest products, Aberdare forests, Kenya

PRODUCT	AVERAGE ANNUAL VALUE (\$s)
Timber	14.6
Medicines	43.8
Honey	29.2
Building Materials	51.1
Wild Foods	21.9
Hunting	7.3
Grazing	58.4
Charcoal	29.2
Fuelwood	51.1
TOTAL	305.6

Note: Believed to be US\$ (see below)

Source: Emerton (1996, *In: Barrow, et al., 2000*). Reproduced with permission of IIED, www.iied.org.

Emerton (1997) and Emerton (1999b *In: Roe & Jack, 2001*) found similar issues with trying to manage Mount Kenya's forests as a strictly protected area,

suggesting that its savior in the long run might very well be as an area managed for multiple use with benefits to the community in cash and kind accruing from bushmeat, other wild foods, medicines, poles, grazing, timber, fuel wood, charcoal, building material, and fees from commercial logging among others, being valued at US\$ 300/year/household for 40,000 households in direct livelihood support. In return, the watershed will be preserved, providing water for downstream users from fishermen, hydropower, irrigation, as well as urban and commercial use.

Sithole (2004 *In: Fabricius, et al., 2004*) found non-timber forest products (NTFP), often called minor forest products, as critical to livelihoods in the Mafungautsi State Forest of Zimbabwe, and the need to have easily accessible harvest permits if poaching of these products was to be controlled. As in Bwindi, the most valuable forest resource, timber, was given to outsiders rather than the local people. Shackleton and Shackleton (2004 *In: Fabricius, et al., 2004*) estimate that in South Africa there are 2.4 million rural households of which 76% are in wooded areas with non-timber forest products (NTFPs)/minor forest products, having a potential value of US\$ 450/household/year totaling US\$ 800 million/year. This is an order of magnitude greater than the tourism income derived from South Africa's national parks, and yet there is little attempt to manage and monitor the offtake as a means of assuring sustainability or in determining how to deal with losses if this land is transformed to other uses. NTFPs contributed 28% of the mean share of all households in rural South Africa (Dovie, 2001 *In: Shackleton & Shackleton, 2004 In: Fabricius, et al., 2004*).

Thus, by maximizing the use of the forest resources, one can maximize the income to families, with individual heads of households benefiting from various specialties linked to harvesting these resources.

CARE Development Through Conservation Project (DTC) staff reported a markedly greater enthusiasm for local access for consumptive use within the Uganda Wildlife Authority (UWA) among conservation wardens and rangers than among enforcement wardens and rangers (Adams & Infield, 1998).

The US\$ 4 million Mgahinga and Bwindi Impenetrable Forest Conservation Trust (MBIFCT) has also been established with capital from the Global Environment Facility (GEF) and was invested offshore, being worth US\$ 5.4 million by March 1998. The Board of Trustees includes three local people and representatives from national and international organizations. If the funds were allowed to accumulate unspent until 2002, there would be enough capital to provide US\$ 400,000/year for projects in perpetuity (Adams & Infield, 1998). Sixty percent (60%) of MBIFCT funds support local projects, 20% support work of two Parks administrations and 20% goes towards research through the Institute for Tropical Forest Conservation (Adams & Infield, 1998; Dutki, 2003). This would imply US\$ 240,000/year for communities. However, the market decline since 2000 has reduced the value of MBIFCT's assets from a high of US\$ 7 million to around \$5.5 million today (Dutki, 2003). In a recent paper presented at the World Parks Conference in Durban, little was mentioned of benefits from this fund, except for small grants, giving one the impression that not much is actually going to the rural communities (Makombo, 2003). Dutki (2003) lists common-good projects from the MBIFCT funds like primary school classrooms, health units and rural road construction to individual income-generating activities like fish farming, beekeeping, other agro-based activities – on-the-farm “integrated rural development” solutions, as opposed to sustainable management of forest resources - as well as creation of conservation awareness (environmental education).

The one danger of such funds is that they are a disincentive for governments to sustainably manage their natural resources as a means of economic development. This encourages them to live off “international welfare” and trust funds while impoverishing rural communities that they attempt to entice with “common property” benefits and failed “integrated rural development” continually driven by Western NGOs all over Sub-Saharan Africa in trying to solve all the problems on the farm (see Chapter 5, Section 5.6.3.1, Agricultural bias by donors as solution to Africa’s backwardness – constraint to appropriate land use; Chapter 11, Sections 11.7.10 Agricultural Bias of Foreign Aid by USAID and 11.10.6 Eco-Colonialism - Conservation Driven by Researchers as Opposed to Wildlife/Natural Resource Managers).

Though the following refers to an analysis of Mgahinga (next door to Bwindi), it equally applies to Bwindi. Community support for the park is bought at a steep price through continuous investment in the community conservation program. The goodwill that outside investment buys is directly related to the sustainability of the flow of revenue from First World donors’ “biodiversity agenda” and secondly, the buoyancy of the tourist economy. Turning gorillas into a resource capable of yielding U.S. dollars in quite large quantities is not a magic solution to conservation or local development problems because of competition for those dollars by stakeholders (e.g., government, various factions within the community). The sustainability of tourist revenues as a source of income should not be taken for granted (Adams & Infield, 1998):

- Gorilla tourism is seen as a cash cow to fund Uganda Wildlife Authority (UWA) and to subsidize biodiversity conservation elsewhere that may not be economically viable; and
- Tourist numbers are dependent on political stability in the region.

By 2002, with the insecurity not only along Bwindi's border (civil wars in the Democratic Republic of Congo/Rwanda), but in general along most of its borders, Uganda was receiving only 5,000 tourists/year as opposed to 60,000/year to Murchison Falls Park alone in the 1960s (Speidel, *pers. comm.*). In 1999, tourists visiting Bwindi were killed by rebel groups. Today, the people of Bwindi are poorer than before the creation of the park. This demonstrates the vulnerability of ecotourism as a basis for conservation and development programs in Sub-Saharan Africa. Community conservation based on ecotourism, not only in Bwindi, but all of Uganda, is therefore, far from assured of being self-sustaining.

Because over 70% of the Uganda Wildlife Authority (UWA)'s budget is from Western donor handouts (Kaye, *pers. comm.*), donors and their allied NGOs and their scientists and "developers" have a strong influence over conservation policies, as opposed to the Uganda Wildlife Authority negotiating conservation policies with local communities that will maximize economic and social returns to the community and government while maintaining biodiversity. As noted (Thomson, *pers. comm.*), the animal rights have a major influence over the UWA conservation policy.

Thus, "It remains to be seen whether the very low amount of resource use established at BINP will be sufficient to ensure stable long term relationships between park and community. As one community member put it: 'While we are pleased to be allowed to continue our beekeeping it represents only a quarter of our former benefits from the forest'" (Wild & Mutebi, 1996).

What happens when the donors pull out? Ogwang and DeGeorges (1992) noted,

"If there is a failure to make maximum use of Uganda's forests and parks for economical purposes in non-critical habitat areas, and farmers are only allowed to use the forests and parks for subsistence

needs while solving all of their economic problems on the farm, they will have that much less of an opportunity, through natural resource based rural enterprises, to escape the endless cycle of poverty that is the major cause of environmental destruction in Africa. This concern was brought out as a major issue in the Environmental Policies and Law in Uganda Seminar held in August 1991. On one hand while the government and the ‘World Community’ pushes for rural enterprise development, it is seemingly embarking on potential policies in the name of Conservation (Defined as ‘Sustainable Use’ but often misunderstood to mean protection/no consumptive use of natural resources) which, like the colonial powers, will cut off the rural community from accessing much of the economically valuable wildlands natural resources in Uganda. It must then be asked who are these parks and reserves for, ‘the people’ or the ‘World Environmental Community ?’ If the right policies are implemented, they can be for both, with core protection areas for ecotourism and research, and multi-purpose wildlands buffer areas that can provide subsistence needs and like the protected core be used for income generation through sustainable exploitation. The question that must ultimately be asked is will the newly created Ugandan parks really serve as a model for linking natural resources to development and entry into a moneyed economy in rural areas? Furthermore, there is no economic analysis to determine to what degree tourism alone will provide adequate income to the rural community from various park schemes to offset areas that could be sustainably exploited with minimal impact on biodiversity or ecotourism”.

It is obvious from the above information and that in Chapter nine concerning CBNRM, that tourism alone will not significantly improve the lives of the peripheral communities. However, wise and sustainable exploitation of all resources within the forest can go a long way in improving livelihoods and should include pit-sawing, both to generate income, as well as to improve habitat for gorillas.

11.11.5 Transfrontier Conservation Areas (TFCAs), Southern Africa

The concept of transboundary conservation was developed in the United States 70 years ago (Dzingirai, 2004). In southern Africa, the idea is to develop parks and contiguous protected areas that cross national borders. The idea is that people

with one visa will be able to freely cross national borders as ecotourists, as will game, and local communities will benefit as in CAMPFIRE (see Chapter 9) from tourism, possibly hunting and selling crafts (Dzingirai, 2004). Like CBNRM, this ideological movement is called by many names such as Transboundary Natural Resource Management (TBNRM) paradigm, Transboundary Protected Areas (TBPA), Transboundary Conservation Areas (TBCA), Transfrontier Conservation Areas (TFCAs) and Transboundary Development Areas (TBDA) (Jones, 2003). This process is donor driven (Katere, Hill & Moyo, 2001; Hughes, 2003 both *In: Jones, 2003*) with buy-ins by NGOs as a means of accessing large sums of money (Levine, 2002 *In: Jones, 2002*) under the globalization process where concern for “global commons” has become a driving force (Jones, 2003) encroaching on rural people (Duffy, 2001 *In: Jones, 2003*), resulting in a new form of imperialism (Carruthers, 1997 *In: Griffiths & Robin, 1997 In: Jones, 2003*) on a grander scale than CBNRM. Large amounts of funding will come from Global Environment Facility (GEF) funding (Pavy, *pers. comm.*). A key supporter of CBNRM in the 1980s and early 1990s, USAID in southern Africa made a dramatic switch between 1996 and 1997 from CBNRM in favor of supporting TBNRM as the result of critical reviews over the lack of success with CBNRM and the questioned role of social sciences and community considerations in conservation and biodiversity. They were prepared to support “back to the barriers” conservation in favor of community involvement (Hutton, Adams & Murombedzi, 2005).

The TFCAs movement appears to be CBNRM on steroids with the adverse impacts on rural livelihoods risking to be magnified, talking community, but acting neo-colonial and in the end disenfranchising local people, resulting in deteriorating livelihoods. The State and NGOs seek to establish TFCAs for a number of political reasons; promoting regional peace, pooling resources to overcome economies of scale and consolidation of key ecosystems that cross political

boundaries, including wildlife migration corridors. They are energized by “romantic ideals of recreating Eden and the Myth of Wild Africa” where wildlife roams free, supported by revenue from a Mecca of tourism free of immigration requirements. NGOs get government buy-in and then use their political influence and expertise to fund such programs. These NGOs hold a lot of power due to their access and control over money and their access to power elites within governments (Magome & Murombedzi, 2003 *In:* Adams & Mulligan, 2003).

Jones (2003) raises concern, as demonstrated in Chapter nine on CBNRM, that few benefits will accrue to rural communities due to “the high amount of ‘leakage’ in the tourism industry with a large percentage of earnings, wages and profits remitted/retained away from the area” (DFID, 2002 *In:* Jones, 2003). As in CBNRM, local communities risk to lose further through changing land uses (Duffy, 2001 *In:* Jones, 2003), resulting in loss of access to traditional natural resources on which they depend economically for sustenance and for cultural purposes. Ultimately, these programs bypass working with communities to manage better and sustainably use their natural resources “conservation” in favor of strict ecological interests “preservation”, usurping community benefits (Metcalf, 1999 *In:* Jones, 2003). In other words, it becomes business as usual for the Western conservation movement and Sub-Saharan African elite, centralizing control over land and resources, as during the colonial and postcolonial era, as opposed to devolution. NGOs facilitate the state in usurping traditional land and resource tenure (Duffy, 2001 *In:* Jones, 2003) using the legal system and international donor support.

Dzingirai (2004) argues that

“because transfrontier resource conservation reduces community control and access to natural resources on a larger scale than CBNRM, it is disenfranchisement at large”.

The architects of TFCAs saw a “scale” that is vast areas traversing artificial boundaries where wildlife could move and in which local communities lived as the solution to conservation and community integration and development, when the real issue is decentralization (Dzingirai, 2004) or really devolution of ownership over the land and the resources (see Chapter 9, Section 9.8, THE WAY FORWARD – CONSERVATION BY THE PEOPLE – STAGE 4 EQUALS DEVOLUTION). Recent initiatives in southern Africa include:

- The Great Limpopo Transfrontier Park (Gaza-Kruger-Gonarezhou Transfrontier Conservation Area (TFCA)).
- The Four Corners (Near Victoria Falls where Zimbabwe, Namibia, Zambia and Botswana meet).
- ZIMOZA (Zimbabwe-Zambia-Mozambique Transboundary Area).

The goal by the end of the 21st century is for TFCAs to account for the world’s largest biodiversity zones (Dzingirai, 2004).

Magome and Murombedzi (2003 *In: Adams & Mulligan, 2003*) raise concern over how beneficial TFCAs will be for rural communities, citing concern by the Makuleke that they will lose their Kruger contractual park land and, over the future, of the 20,000 rural poor in Mozambique’s side of the Gaza-Kruger-Gonarezhou TFCA (now called Great Limpopo Transfrontier Park), especially the 6,000 living within Mozambique’s newly proclaimed Limpopo National Park. There is concern that these 6,000 people in Mozambique and the Sengwe Community of Zimbabwe that lie in the corridor linking Kruger and Gonarezhou National Parks, may be relocated (Magome & Murombedzi, 2003 *In: Adams & Mulligan, 2003*). Likely, as during colonial times, and is as all too frequent in Western donor/NGO driven conservation in the 21st century – against the will of

local communities. The conceptualization and agreement in the creation of the Greater Limpopo Transfrontier Park took place without any consultation with local communities, while empowering the state as owner of the land and resources, not the local community – thus no real empowerment (Jones, 2003; Dzingirai, 2004). By 2003, only two workshops had been held with the elected community committee responsible for the five million people living in the area (Wolmer, 2003a *In:* Jones, 2003). Forty percent of the households in the Mozambican portion of the Great Limpopo Transfrontier Park never heard of the TFCA concept and of their involvement (RRP, 2002 *In:* Jones, 2003), resulting in an NGO/donor driven top-down process (Grossman, 2003 *In:* Jones, 2003).

Already, the Mozambican government is using heavy handed repression against local hunters “poachers”, with plans to move the 6,000 residents outside of the park. Plans are to leave residents along the Olifants River alone. The north and south portions of the park will be used for tourist hunting (sport hunting) to generate income for community development and to operate the park, since ecotourism is not expected to be significant (Swanepoel, *pers. comm.*). It is not too hard to speculate which stakeholders will retain the majority of the net benefits from such enterprises. For sure, it will not be the rural populace who will likely experience further marginalization and increased poverty from the TFCA. In essence, TFCAs are forcing rural local people into voiceless partnerships with the state and NGOs backed by Western donor funding (Magome & Murombedzi, 2003 *In:* Adams & Mulligan, 2003).

There is concern that in the to-be-fenced (wildlife in and people out) Sengwe corridor of Zimbabwe, villages will be moved to make way for “Wild Africa” that tourists wish to see, resulting in loss of the most fertile land along rivers, pools and pans critical to both people and livestock, wildlife, forest products such as the liala palm used in handicrafts and community reserve land used for “expanding

households, and strategic relocation as a result of conflict, witchcraft accusations, feuds, and general misunderstanding" (Dzingirai, 2004). Is this not a modern version of what will become overcrowded, impoverished and degraded homelands, a repeat of colonialism in the name of conservation?

Relocating communities onto formerly commercial farms, which the bankrupt Zimbabwean government cannot support (e.g., extension and startup costs), will socially dislocate them from the cross border network of communities who have learned to depend on each other for a flow of resources and commodities necessary for survival in a subsistence economy. Establishment of border posts, an armed bureaucracy and formalization of mobility (customs) may actually impede the fluid movement of local people and resources across borders, central to the livelihoods in this region of southern Africa, and end up as detrimental to the communities. Internal relocation is not an option as land is scarce and this will result in over-grazing and habitat degradation from compression – a symptom of creating parks and protected areas all over the subcontinent, possible fighting over land that becomes a scarcer resource, while requiring communities to give up their current identities and become part of a new community where the relations risk to be subservient (Dzingirai, 2004). Dzingirai (2004) argues that TFCAs disenfranchise

"transfrontier communities by reducing their traditional access and control over resources. It transfers resources, including land upon which community livelihoods are based, to states and private business...the state continues to present transfrontier conservation as being community centered...this repackaging of conservation allows the state to continue its control of natural resources...The rhetoric of transfrontier conservation disguises community exclusion from natural resource management. But if it is disguised control of natural resources, it is one that generates hostility and opposition among communities able to peer through its form".

As discussed in Chapter nine, middlemen (the state, private sector and NGOs living off donor money supposedly to help the local people) will make most of the profits and benefits, while the poor will only get poorer unless there is a paradigm shift in the role of communities in African conservation. Wolmer (2003b) raises most of the concerns discussed above. The jury is still out as to how successful such programs will be if forced on rural communities. In addition, the history of relocations is that people tend to be marginalized on land less rich in renewable resources.

11.11.6 Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the “Dobi Dobi”, More Parks and Protected Areas

Along the frontiers of Southeastern Cameroon, Congo Brazzaville and the Central African Republic, a new form of colonization began at the end of the 20th century in an invasion by commercial logging companies, Western conservation NGOs and safari operators linked to the transnational Lake Lobéké/Dzanga-Sangha/Nouabalé-Ndoki “Tri-National De La Sangha” National Park that crosses these three borders. Funded by international donors, Nelson (2003b) calls this vast takeover of traditional territories by Western conservationists, “Corporate Conservation”. The project area overlaps the traditional farming, hunting and gathering lands, supporting thousands of Baka Pygmies and Bantu ethnic groups. There is concern that this is leading to the imposition of new rules affecting access to forest resources on which their livelihoods are based, “concordant with a systematic pattern of community neglect and marginalization observed in the management of other parks in Cameroon” (Nelson, 2003b). Local communities have not been involved in planning for these efforts carried out by national and international elites in isolated capital cities (Nelson, 2003b). The Indigenous Peoples of Africa Coordinating Committee (IPACC) at the 33rd Session of the

African Commission on Human and Peoples' Rights (ACHPR)/Niamey-Niger 15-29 May 2003, have raised concern that conservation and development programs initiated through the

"Congo Basin Initiative, the African Partnership for Forests, the Africa Forest Law Enforcement Group and the New Partnership for Africa's Development (NEPAD), are all likely to intensify this carve up of indigenous peoples' forests into protected areas and logging zones without the rights of indigenous peoples being taken into account" (Colchester, 2003).

11.11.6.1 Introduction

The following case studies in Southeastern Cameroon and northwestern Congo Brazzaville call into question the sustainability of logging and current conservation practices in the biologically diverse dense humid tropical forests of the Congo Basin. After the Amazon, the Congo Basin contains the second largest dense humid tropical forest in the world of about 2 million km². Within this forest, there are approximately 400 mammal species, 655 bird species and 10,000 plant species (Musa, 2006). Most importantly, they not only call into question the future of the Basin's natural resources, but more importantly the unique cultures such as the Baka Pygmies and others who have lived for thousands of years in harmony with the forests, but whose futures are in serious jeopardy.

"These parks were created for white men, who can still hunt in the parks, who can go into the parks and do whatever they want...We didn't even know the parks existed until the authorities started sending our people to prison for hunting. That was when we found out that we couldn't hunt where we used to hunt and that we were not allowed to hunt the wild animals that were killing our livestock. Why didn't anyone ask us what we thought? Then we might not have these problems...I don't know why people think creating a national park (and safari hunting blocks) and making people suffer is a good thing. We had always lived with these animals, and there were no problems until your national parks

came. Did you know that what is now Bénoué National Park used to be the private hunting grounds of the *Lamido de Rey-Bouba* (Fulani ruler) ...we had to make sure people didn't hunt there without his permission...and defaulters were punished by our traditional laws. People were not allowed to hunt certain animals because they were reserved for the chief...While we could not always hunt in the Lamido's hunting ground, we could hunt somewhere else. We had a chief hunter, who had to perform traditional rites to the gods before we could go hunting. He always gave advice on when we could hunt and what not to hunt. People generally had to obey him; those who did not could easily be killed by wild animals" (Njiforti & Tchamba, 1993 *In: Kemf*, 1993).

These were responses elicited from people, mostly Fulani and some Bantu ethnic groups living around Faro (330,000 ha), Benoué (>180,000 ha) and Boubandjida (220,000 ha) national parks, northern Cameroon, in the early 1990s in interviews conducted by the Institute of Animal Research (IRZ) of Cameroon. Surrounding these national parks are about 28 hunting blocks, also off limits to local people. Today, Martin Tchamba⁴¹⁷ is the head of WWF Cameroon, but as will be seen below, 14 years have gone by and nothing has changed. Traditional management systems are being ignored and Western donor funding is being used to disenfranchise, alienate and at worst, destroy local cultures in Cameroon.

"With striking parallels, the same processes endanger nomadic (pastoral and hunter gatherer societies) people all over Africa. The rate and extent of loss vary widely, but the reasons are the same. In almost every case, it is man's tampering with nature that dooms them. The land and animals that supported them are disappearing. Boundaries prevent them from moving on. In the end, their choices are narrowed to one: squat at the side of a road and wait for food relief trucks" (Rosenblum & Williamson, 1987).

⁴¹⁷ Dr. Martin Tchamba, Director of Conservation, World Wide Fund For Nature (WWF), Central African Regional Program Office (CARPO), Panda House, Rue la Citronnelle, BAT Compund, Bastos, P.O. Box 6776 Yaounde, Cameroon, Tel: 237-221-62-67/221-70-83/221.70.84, Fax:237-221-42-40, Mtchamba@wwfcapo.org, www.cameroon.org.

While this concerns the Bushmen of the Kalahari, it is equally appropriate to this case study of the Baka Pygmies of Southeastern Cameroon and applies across Sub-Saharan Africa to nomadic herders and their loss of habitat from elimination of dry season grazing areas along floodplains by dams, and encroachment on their habitat by itinerant farmers as their populations expand and fallow periods disappear.

The Global Environment Facility (GEF) was established after the RIO Summit of 1992 to support costs incurred by governments in conserving public goods with four focal areas: biodiversity, climate change, international waters and ozone layer depletion, as well as desertification and deforestation related to these four target areas. It is jointly run by the World Bank, UNDP and UNEP, with its own Secretariat and has a focal point in each country. It helps support the Convention on Biological Diversity (CBD), the UN Framework Convention on Climate Change and the Montreal Protocol on Substances that Deplete the Ozone Layer (LWAG/DEFID, 2002).

The following case study presents concerns over the implementation of a Global Environment Facility (GEF) program in Southeastern Cameroon (GEF, 1995).

“To date there do not appear to have been any reviews of the impact of GEF projects on poverty, lessons learned about enabling poor people to participate, or the extent to which GEF financing has compensated poor people for the ‘opportunity costs’ of conservation”,

though a two year Review of Human Impacts of GEF-Financed Projects is just underway and/or about to be finished (LWAG/DFID, 2002). GEF programs are implemented by Western NGOs through African governments.

If this case study is any indication about what is happening to the lives of rural Africans living in GEF funded conservation areas, various parties should be held accountable for human rights violations every bit as serious as those being tried by UN tribunals over the Rwanda genocide, as entire lifestyles and traditional management systems are being eradicated. It appears to be a fairly typical scenario of Western NGOs imposing unrealistic conservation systems (e.g., parks and hunting blocks) excluding resource dependent poor, resulting in increased impoverishment and cultural degradation. Governments appear to go along with the process, the political elite in these bureaucracies reaping a percentage of the benefits in the form of vehicles, in-country and overseas *per diem* trips, study tours, etc. They appear so de-linked from the local people and even if they have come out of rural areas, they seem oblivious or blinded by what is happening, or just plainly do not care. The references in this report to Schmidt (1998) and Zouya-Mimbang, (1998) were anthropological analyses written for the GTZ-funded GEF program so that the donors, governments and NGOs were warned by the anthropologists about the consequences of their actions, with recommended mitigation apparently ignored. It appears few, if any, of their recommendations were heeded.

11.11.6.2 Modern conservation and the Baka Pygmy

Over the past couple of decades, the traditional lifestyle of the Baka Pygmies has been disturbed by outside forces including (Schmidt, 1998):

- Central Government's Sedentarization Policy permanently settling the Baka into villages, abandoning their nomadic lifestyle – to some degree this appears to be a continuation of the policy of *regroupement* begun under French colonialism.

- Allocation by government (MINEF – Ministry of Environment and Forests)⁴¹⁸ of commercial forestry concessions dissecting and carving up the forests and creating logging roads that allow access by outsiders, especially outside commercial poachers (Figure 11.2).
- Allocation by MINEF of safari hunting concessions in commercial forest concessions for bongo (*Tragelaphus eurycerus eurycerus*), forest elephant (*Loxodonta africana cyclotis*), dwarf buffalo (*Syncerus caffer nanus*), western forest sitatunga (*Tragelaphus spekei gratus*), hylochere (giant forest hog) (*Hylochoerus meinertzhageni rimator*), *potamochoere* (red river hog) (*Potamochoerus porcus pictus*) yellow-backed duiker (*Cephalophus sylviculator*) and other duiker – areas which the Baka are no longer allowed to frequent, sanctioned by MINEF, the World Bank, the EU and WWF through the Global Environmental Facilities (GEF) program.
- As a result of the Yaoundé Declaration of March 1999 signed by the leaders of leaders of six Central African governments—Cameroon, Chad, the Republic of the Congo, Gabon, Central African Republic, and Equatorial Guinea and a follow-up meeting in 2000 (World Bank/WWF Alliance, 2004) with sanctioning by MINEF, Western NGOs (WWF, WCS) and donors (GTZ, World Bank) through GEF - carving up their forests into parks – which the Pygmies are no longer allowed to frequent.
- Catholic Church, whose influence has been somewhat positive given the uncontrollable changes taking place in the Baka culture.

⁴¹⁸ Ministère De l'Environnement Et Des Forêts, Immeuble Ministériel N°2, Yaounde, Cameroun. In 2004, to increase power sharing between regions, MINEF was split into two ministries; Ministry of Forests and Wildlife, and Ministry of the Environment (Green Issues: wildlife and forestry) and Protection of Nature (Grey issues: Pollution of water, soil and air). In turn, the Department of Wildlife, now under the Ministry of Forests and Wildlife and Ministry of the Environment, was split, respectively into the Department of Conservation and Wildlife, and the Department of the Valorization of Wildlife. Pressure coming from the World Bank may result in a reconsolidation of this ministry, even if there is a name change (Mouncharou, *pers comm.*).

Many people place the beginning of this problem with the World Bank structural adjustment (SAP) program, which began in the late 1980s/early 1990s. The 1981 *Loi Portant Régime des Forêts, Faune et Pêche* (Forestry, Wildlife and Fishery Law) set aside a goal of 10% of Cameroon's territory in protected areas (Mouncharou & Gomse, *pers. comm.*). The goal of each country placing 10% of its territory in natural systems has been established internationally by the International Union for the Conservation of Nature (IUCN)/World Conservation Union (WCU) (Magome & Murombedzi, 2003 *In:* Adams & Mulligan, 2003) emerging out of the World Parks Congress of 1982 in Bali, Indonesia, with a goal of achieving this percentage by 2000 (Peterson, 2003). Among other conditions established by the World Bank in its structural adjustment (SAP) program was to revise the 1981 law. Bank "experts" were allowed to play a major role in rewriting this law that, among other things, stipulated that 30% of Cameroon's territory would be turned into protected areas. The first attempt to pass this law at the National Assembly was rejected by the *Députés* that is the formally elected representatives. The government put pressure on them to pass this law, without which there was a threat of no funding from the World Bank. It was passed into law in 1994 (Mouncharou & Gomse, *pers. comm.*). By 2002, 15% of Cameroon's territory was in protected areas and it is projected the 30% mark will be attained before 2005 (MINEF, 2001), but at what costs to local people and their cultures? A key question, which must be asked, is can the wildlife survive if the people cannot? In marginalizing the people, is it not possible that in trying to survive that they may very well destroy the wildlife out of desperation and/or anger, the very wildlife over which they were once caretakers? Hakizumwami (2000) states that the continual pressure to create more

"wildlife reserves and National Parks is observed in Central African countries for most cases, policies governing their management stress on law enforcement and non-consumptive utilization such as ecotourism without taking into account the key

socio-economic role of wildlife products to the communities living in vicinity of these areas. This resulted in negative attitudes of local communities towards conservation programs, and perpetuated antagonism between these communities and conservation practitioners”.

In Cameroon, it is estimated that if Pygmy populations were to survive only from forest resources without supplementing their diet with starches from “black” farmers, they would have to reduce their populations by 75% of the current density (Vande weghe, 2004). Although a few are turning to farming, many are resorting to stealing from Bantu farmers to obtain their starches (Vande weghe, 2004; Biko’o, *pers. comm.*), which can no longer easily be traded for forest products because of both a decrease in available forest accessible to the Pygmies and declining bushmeat from over-exploitation of what has become an “Open Access Resource”. When caught, the Pygmies are humiliated through public beatings. If wildlife officials find Pygmies with what they believe to be illegal bushmeat, repression is used, including burning down their huts (Biko’o, *pers. comm.*).

Structural Adjustment (SAP) is also believed to have played a major role in increased commercial poaching in Southeastern/Southern Cameroon (Ndoye & Kaimowitz, 1998; Zouya-Mimbang, 1998; Solly, 2002; Bosshard, Bruli, Horta, Lawerence & Welch, 2003; Peterson, 2003; Betti, 2004). This began around 1988 with dissolution of the *Office National de la Commercialisation des Produits de Base* (ONCPB), the state marketing board for cocoa and coffee, resulting in the official price of cocoa being slashed by September from 420 CFA/kg⁴¹⁹ to 250 CFA/kg due to weakening cocoa prices on the world market. Between 1989 and 1990, the cocoa companies were unable to pay farmers. Free distribution of fertilizers, herbicides and pesticides was gradually stopped. From 1991 to 1992,

⁴¹⁹ *Franc de la Communauté Financière Africaine*, Francophone Africa Currency = FCFA, at time 100 CFA/1 French Franc (FF), now fixed to the EURO at 655.957 FCFA/1 EUR.

privatized cocoa trade was reintroduced (e.g., elimination of government marketing boards), resulting in fraudulent behavior, including falsifying the balance for weighing the cocoa, fictional price declarations, illegal night-time purchases at lower prices, the division of purchasing zones by companies to avoid competition and coxage (the selling of one farmer's harvest to another at a low price). The World Bank induced CFA devaluation in 1994 from 50/1 to 100/1 against the French Franc, exasperated this problem (Zouya-Mimbang, 1998; Solly, 2002; Bosshard, *et al.*, 2003). Vande weghe (2004) believes many rural people who had immigrated to the city as a result of structural adjustment policies (SAPs), found themselves without work, returning to their rural roots and poaching, the "politics of despair" as discussed in Chapter 9, Section 9.7.8, Lack of Adequate Alternative Livelihoods. This was a common problem in several west African countries (Stiglitz, 2002) as a result of IMF structural adjustment programs that, among other things, eliminated marketing boards with the result that

"government revenue was lowered, peasants were little if any better off than before, and a few local businessmen (Mafiosi and politicians) were much better off" (Stiglitz, 2002).

Bosshard, *et al.* (2003) also estimate that following the devaluation, which reduced the price of Cameroonian products on the world market, Cameroon's exports of raw logs increased by 34%. Giles-Vernick (2002) explains how IMF/World Bank structural adjustment policies (SAPs), including devaluation of the CFA, while encouraging increased timber and mining in the neighboring Central African Republic, also encouraged the creation of protected areas. In addition, budget cuts recommended by the Bank resulted in the unemployment of large numbers of village extension workers in rural areas (Solly, 2002; Bosshard, *et al.*, 2003). For many farmers, this led to complete or partial abandonment of their cocoa plantations and a loss of faith in the state that had previously been

perceived as their protector, looking after their interests. Looking for alternative sources of income for survival, many groups turned from subsistence to commercial hunting to supply the demands of the increasing urban market (Solly, 2002; Bosshard, *et al.*, 2003) or illegal logging (Bosshard, *et al.*, 2003). Hakizumwami (2000) gives an example of Ndjalobèkoé Village, Boumba-et-Ngoko Division (region of Yokodouma), Southeastern Cameroon, where in 1992 out of US\$ 2,277 (CFA 611,550/FF 12,231) made by the village in that year, hunting constituted the major source of income:

- Hunting: 50.21% of income;
- Livestock (e.g., goat, chicken, pigs), 16.21%;
- Arki (Traditional Beer), 15.70%;
- Agriculture, 11.85%;
- Gathering, 4.10%; and
- Fishing, 1.31%.

Structural adjustment policies (SAPs) exacerbated this problem. On the other hand, as the IMF/World Bank and the West in general push for more protected exclusion zones, there will be dire consequences for local residents. The loss of access to wildlife resources, the main source of revenue in much of the forest, may result in a complete collapse of the rural economy unless economically sound and socially attractive alternatives are offered, as well as a loss in the major source of protein in the forest areas (Hakizumwami, 2000) of not only Cameroon, but the Congo Basin in general (see Chapter 10, Section 10.3.4, CITES Cannot Stop the Bushmeat Trade).

In Cameroon, the Global Environment Facility (GEF) sites/programs of the World Bank and Western Donors were established in the early 1990s, one around the northern savannah site consisting of 28 hunting blocks and parks of Bénoué, Faro

and Boubadjida and the other in the tropical lowland forest site of Southeastern Cameroon. This area of Southeastern Cameroon is part of a Transfrontier Conservation Area (TFCA) created in 2000, the Lake Lobéké/Dzanga-Sangha/Nouabalé-Ndoki “*Tri-National De La Sangha*” National Park. Similar to the San in the Kgalagadi Transfrontier Park (Magome & Murombedzi, 2003 *In: Adams & Mulligan, 2003*), the Baka Pygmies have been seriously marginalized because of this process.

While in recent times few people lived within the protected areas in the northern savannah zone, which had been established during the colonial era (see Chapter 5, Section 5.9.3.4, Over-population and livestock, a threat to wildlife in northern Cameroon), the Southeast forest area was the home of the “Forest People”, the Baka Pygmies and a number of Bantu ethnic groups. There are actually three Pygmy groups in Cameroon. The largest group is the Baka found in Southeastern Cameroon west to Mintoum and crossing into portions of Gabon, Congo, and the RCA. In Cameroon, this group is estimated at about 100 – 150,000 people (Mouncharou, *pers. comm.*). An estimated 40,000 Baka live in Southeastern Cameroon⁴²⁰ speaking an Oubangan language from the Gbandili-Sere family (Schmidt, 1998). In total there were an estimated 84,440 persons living in Southeastern Cameroon⁴²¹ in 1987, the difference being made up of large numbers of different Bantu-speaking ethnic groups.⁴²² The density of people is 2.2 inhabitants/km²; among the least populated regions in Cameroon. The majority of people live in a few major towns (e.g., Yokadouma, Moloundou,

⁴²⁰ In this case, Southeastern Cameroon is really the Eastern Province that extends from the Dja Biosphere Reserve eastward (Biko'o, *pers. comm.*).

⁴²¹ In this case, Southeastern Cameroon appears to be the Division of Boumba-et-Ngoko. If the 84,440 inhabitants are divided by 2.2 people/km², one obtains 38,181 km², nearly the same as the area of 38,661 km² in Table 11.19 below.

⁴²² The dominant ethnic group in the Eastern Province, Cameroon in the Division of Boumba-et-Ngoko is Vongvong (Pongpong). Southeastern Cameroon (Division of Boumba-et-Ngoko) is broken up into three *arrondissements*; Yokadouma, Moloundou and Garigombo. The dominant ethnic group in Yokadouma is Vongvong (Pongpong), in Mouloundou the Bangando and in Garigombo the Mpiemu (Biko'o, *pers. comm.*).

Kika, and Libongo) and in small villages along the main logging roads. Forests are virtually uninhabited (e.g., not permanently inhabited), covering 85% of the Southeastern Cameroon (Zouya-Mimbang, 1998), but play an important role in both the survival and cultures of the local people, especially the Baka.

Between about 1995 and today, parks and safari areas have and are being established as though this vast area of Southeastern Cameroon is empty of people, consisting only of elephant, gorilla, chimpanzee and other charismatic megafauna with which the West is in love. On the contrary, these forests are the gardens and back yards, especially of the Baka, whose lives risk to be forever changed given the current approach of excluding them from much of what they consider their forest (see Chapter 2, Section 2.1.5.3, Mobility and resource management, Baka Pygmies of Southeastern Cameroon). It might be argued that the Baka today are more endangered than the lowland gorilla; European conservationists and government being more concerned about the great apes and forest elephants than this ethnic minority (see Chapter 3, Section 3.6.1, Separation of Maasai from Ngorongoro Crater). To think that this is occurring in the 21st century, backed by Western donors and NGOs with the same apparent lack of sensitivity as occurred during the colonial era, is appalling. It is hoped that somehow this case study will sensitize decision makers, NGOs and donors to the steps that must be taken to integrate these cultures, especially the Baka, into the sustainable management of these areas. The current breakdown of the land use as imposed by the GEF program in the Division of Southeastern Cameroon, officially called Boumba-et-Ngoko is depicted in Table 11.19, with little or no consultation with local people in determining these land uses. Just west of this case study area, Nelson (2003b) details similar non-consultative processes marginalizing Baka in the creation of the neighboring Dja Biosphere Reserve and Boumba-Bek National Park that, with Minkébé National Park in Gabon and Odzala National Park in the Republic of Congo, roughly demarcate the new

Congo Basin Forest Partnership (CBFP) landscape of the TRIDOM (Dja-Boumba-Bek-Nki-Odzala-Minkébé Transfrontier Conservation Area (TFCA) between Cameroon, Congo Brazzaville and Gabon) project being funded by GEF, which cuts Baka off from accessing key resources in these areas. Duffy (2000) explains that the Western

“donors and conservationists often closely mirror the industrialized world. This has led to the imposition of wildlife preservation plans that ignore the needs of rural people in particular”.

Thus, about 70% of the forest area, which the Baka freely roamed, have become off limits to them from “development” and “conservation and biodiversity” activities. What one is seeing all over Sub-Saharan Africa, with pressure from Western NGOs backed by Western donor money, is neo-colonial or eco-colonial imperialism to the highest degree; areas being set aside for wealthy white tourists and hunters from America and Europe to the exclusion of the African people.

Table 11.19: Land use, Southeastern Cameroon (Division of Boumba-et-Ngoko)

LANDUSE	HECTARES	PERCENTAGE TOTAL AREA
Lake Lobéké National Park	217,850 ha	7
Nki National Park	309,360 ha	8
Boumba-Bek National Park	238,260 ha	6
Safari Hunting Zones (in logging areas)	1,048,090 ha	27
Logging areas	699,010 ha	18
Community Hunting Zones (a)	1,203,270 ha	31
Other areas	150,260 ha	4
TOTAL	3,866,100 ha	-

One could argue if the current approach to conservation continues unabated, the Baka way of life is in jeopardy, and will likely fade away within the next one to two generations; and with this - a loss of cultural and traditional knowledge that will never be recovered. Once again, land and resource tenure systems are at the heart of this issue, with the state owning about all land outside of the cities, while traditional ownership goes unrecognized (Peterson, 2003).

For the Baka, each family group or band has a clearly defined territory. Everyone from this family has the right to use the “paths of their ancestors” and to exploit the resources around these paths. Only those Baka and Bantu who have been authorized by the *propriétaires de la route* or the owners of the route have the right to use these paths and thus, the resources of an extended Pygmy family (Schmidt, 1998) (see Chapter 2, Section 2.1.4.2, Territory and wildlife management among the Baka Pygmies and other ethnic groups of Cameroon). The Baka admit that it is impossible to feed themselves all year from the forest, especially during the rainy season, when the wild ignames are not yet mature. Thus, their movements, like any hunter gatherer, are seasonal (see Chapter 2, Section 2.1.5.3, Mobility and resource management, Baka Pygmies of Southeastern Cameroon). The government sedentarization policy for the Baka has had a major impact on this semi-nomadic lifestyle.

11.11.6.3 Failure to integrate Baka into managed bushmeat harvests

“Non-timber forest products (NTFPs) and subsistence agriculture have traditionally formed the basis of local livelihoods and exchange networks between different groups of people living in these forest areas” (Forest Monitor, 2001).

Bushmeat is very important in the diets of the Baka. They distinguish between hunger “*pote*” and hunger for meat “*pene*”, without which they lose their love of life (Schmidt, 1998). Like in any hunting-gathering culture, serious hunters such as elephant and gorilla hunters with great skills, number among a small percentage of the male population (Zouya-Mimbang, 1998), though there are many “small game hunters”. Other resources harvested from the forest include various wild roots, ignames (wild yam/tuberclles), honey and termites. They also fish - men with hook and line and traps, women with scoop nets and weirs (Schmidt, 1998).

Most hunting also takes place within short distances of the village. Hunters are, for the most part, men of between 18 and 55 years of age, who occasionally use guns, but mostly catch their prey with steel wire traps/snares (*pieges*) (Abilogo, Mondo, Logo & Nguiffo, 2002). This form of hunting has been adopted from the Bantu. Formerly, the Baka mainly hunted with spears and *arbaletes* (crossbows and poisoned arrows).

During their long dry season (August/September to March), visits may be made in the forest to the “Molongo”, camp where the Baka gather roots and wild mangoes, fish with weirs, search for honey and hunt small game with lance, snares (pulled each morning), often made from steel cable instead of traditional vines, or crossbows with poisoned arrows (*arbaletes*). This is believed to be mostly subsistence hunting, since the villages are too far removed to transport large quantities of these resources, other than when some of them periodically return to town with some game and honey to exchange for money or trade for basic necessities. Mobility of the Baka, like many hunter-gather groups prevented over-exploitation (see Chapter 2, Section 2.1.5.3, Mobility and resource management, Baka Pygmies of Southeastern Cameroon). Their identity with the forest spirit, Djengi, traditionally prevented them from harvesting more than they

needed for basic necessities (food and the trading of surplus bushmeat for basic household necessities and sometimes alcohol) (Schmidt, 1998) (see Chapter 2, Section 2.1.8, Taboos as an Aid in Wildlife Management).

Unfortunately, MINEF has outlawed hunting for protected and partially protected species (elephant, buffalo and gorilla), though allowing “non-exaggerated” harvesting and collecting of certain species such as reptiles, rodents and certain *cephalophores* (duikers) (Mboh, 2001; 2002). Thus legally, the Pygmies have been officially cutoff not only from accessing key hunting areas, but also key species that have provided them with major sources of protein and income (elephant cut into about 250 pieces valued at CFA 1,500 each⁴²³ and gorilla into 120 pieces of about the same value) (Mouncharou, *pers. comm.*), in favor of small game with comparatively little protein or monetary value. Though controversial, all three of these species could probably be harvested sustainably by Pygmies as a source of both protein and money, under an intensive management scheme. However, as will be described below, the current uncontrolled and unmanaged “Open Access” bushmeat trade, created through modern conservation schemes displacing traditional management controls, is likely unsustainable. In fact, Hakizumwami (2000) states throughout central Africa,

“since wildlife is state owned wildlife is treated as an open access resource, and individuals have an incentive to (harvest) as much animals (as possible) to maximize income before other people could do the same. As a result, local communities no longer feel themselves responsible for the conservation of wildlife. This led to the degradation of the symbolic value of wildlife in the eyes of local communities and to the impoverishment of the biodiversity”.

The Baka cannot, or will not, abandon traditional forest foods even if they are becoming rare. At Mambele village, the WCS tried to get the Baka to stop hunting

⁴²³ Euro 2.3 & US\$ 2.7 in 2005. Note this is about 8.8 times less than Tomlinson (2007) estimates for the meat value of a forest elephant); US\$ 6,000 versus US\$ 675.

and to eat beans in place of bushmeat, which the Baka cannot accept and which demonstrates a scorn for their culture. For the Baka, the forest is not just a source of food, but also a source of happiness. One of the important attributes of the forest is bushmeat. To forbid eating bushmeat is to kill or eliminate their culture. They ask, how can a people who buy nothing from the industrial world, except pots and machetes, who have no desire to change their lives, survive if they cannot exploit the forest? (Schmidt, 1998). The external idea of “conservation” that is, as described by Schmidt (1998), “preservation areas” and exclusion zones such as parks and safari areas, is not easily accepted by their culture. The Baka have traditionally always practiced “conservation” that is sustainable use.

The Baka and local Bantu call organizations like WWF and WCS, “Dobi Dobi”, which appears to be their way of pronouncing “WW” in World Wildlife Fund (WWF)’s acronym “WWF”. For them, these NGOs are American organizations or white Anglophones driving around in new air-conditioned Toyota land cruisers with the windows up, who have bought “their forests” from the President of Cameroon to protect wildlife and to stop them from hunting. The Baka fear the “Dobi Dobi” more than they fear the Bantu (Schmidt, 1998). The local people feel disdain for these “foreigners” driving their air-conditioned land cruisers and the repressive policies being imposed on them, but are disorganized and not knowing their full rights are incapable of fighting what is happening. Any attempt to organize is dissuaded by authorities, being put into a political context such as forming an opposition party/group. University students from the area are afraid to become a voice for the people, as they fear being killed through poison or witchcraft for standing up to the status quo (*Biko'o, pers. comm.*). Local people have even tried to stop logging of “their forests” by blockading logging roads. Such efforts have failed, as the military/police through repression, quickly put a halt to such insurrection.

The Baka see the protected areas (Lake Lobéké, Boumba-Bek, Chute de Niki national parks and hunting blocks) as a white man's plan to protect wildlife from their hunting, which implies for them that the white man places more value in wildlife than in the Baka who live off wildlife. For them, the whites want to protect wildlife and make the Baka disappear without bushmeat, without means and without culture – a humiliation (Schmidt, 1998). It should be noted that in an earlier case study on Tanzania, Tepilit Ole Saitoti of Ngorongoro had similar statements to make with regard to how whites perceived wildlife versus his Maasai people (see Chapter 3, Section 3.6.1, Separation of Maasai from Ngorongoro Crater).

“If we have nothing to eat and the safari people and Dobi Dobi eat nearby, is this good”? (Schmidt, 1998, quoting a Baka women).

The references in Schmidt are to one particular safari operator,⁴²⁴ but in general, most safari operators consider anyone in their hunting block as a poacher and if found, they will normally confiscate their snares and any meat or food, burn their camp, likely ruff them up and then throw them out of the area. Not far away, in 2007 for revenge, after a poacher was allegedly shot in self-defense by professional hunter Geoffroy de Gentil, poachers destroyed Lognia camp belonging to Mayo Oldiri along with three landcruisers (Safari Press & Sports Afield, 2007). To the principal author's knowledge, there had been no attempt by an operator to develop a land use plan with the local community, allowing controlled access for various resources in the hunting block, while collaborating with the community to keep outsiders from gaining access.

⁴²⁴ Alain Raoul, Africam Safaris, Chateau L'Abeille, 4562 Cerdon du Loire, France, Tel: 333-238360714. Had problems in getting along with local people in hunting block in southwest border of Lake Lobéké Park. Eventually he had to move out of area to an area north of Libongo, since area was heavily poached, many say in revenge for repression against local people.

11.11.6.4 Logging companies and the unsustainable bushmeat trade

For the Baka, the parceling up and fragmentation of the forest through its dissection with commercial logging roads has allowed the sun in so that it is now not much different than the village [see Section 11.11.7, Case Study Bongo in The Congo (Brazzaville)]. Some complain that the logging roads now disorient them. Many medicinal plants and plants that furnish oil are found only in virgin forests (Schmidt, 1998). This in-migration of large numbers of people working in the logging camps creates tremendous pressure on the wildlife and helps create a market for commercial poaching (Zouya-Mimbang, 1998; Peterson, 2003).

It is estimated that logging trucks (*grumiers*) transport 85% of the bushmeat from commercial poaching camps to the cities created by the logging camps and to urban centers as far away as Douala and Yaoundé. The truck drivers often providing the rifles, ammunition and steel cable, drop off the poachers and pick them up (Zouya-Mimbang, 1998; Ape Alliance, 1998 *In:* Hakizumwami, 2000). In some cases, high level *functionnaires*, including wildlife officials, organize, support and protect poaching networks (Vande weghe, 2004). Guns can be confiscated, poachers arrested and both can be back in circulation within days. Commercial poachers in Cameroon and the region, but often coming from outside the areas being poached, can earn excellent salaries comparable to park guards and thus, have little incentive to stop; in the Central African Republic, a poacher can earn US\$ 400-700/year, in northern Congo US\$ 300/year and in Cameroon from US\$ 250-1,050/year (Peterson, 2003). Often, local Pygmies are co-opted to help poachers (Vande weghe, 2004) and maybe this is understandable given the fact that much of their forest and its resources have been confiscated by government, NGOs, logging companies and safari operators. Maybe they need to get in on the action while it lasts, as they see their resources being plundered before their eyes.

The problem of commercial bushmeat is not deep forest poaching, but that which takes place just off logging roads (Barrado & DeGeorges, 1995; Zouya-Mimbang, 1998), though today it is becoming harder to find deep forests as logging roads expand and penetrate, bringing sunlight, poachers and ecological/cultural devastation to the shaded domain of the Pygmies. Until recently, hunted duiker populations were re-supplied by individuals migrating in from adjacent non-hunted areas. As development of the logging industry continues throughout the region, undisturbed habitat will diminish as logging roads increase access, fragmented forests will increase and game populations that have been able to tolerate even commercial hunting levels may lose that capacity due to habitat degradation and increased access to “seed” populations (Figure 11.2). A significant decline in duiker could result in adverse impacts on the population status of predator species such as leopard and golden cat (Eves, Stein & BCTF, 2002). Commercial poaching traps all species regardless of their international status under CITES, their local status under Cameroonian law, sex, age or pregnancy status. In essence, logging and logging roads have broken open a previously closed system,

“A door has been unlocked and drawn wide open, so that vast portions of this recently intact, remote and challenging forest are today entirely no longer intact, remote, or even challenging. Loggers’ roads throughout the Congo Basin today allow hunters in and meat out, and they have made bushmeat cheap and readily available to a huge market of urban consumers” (Peterson, 2003).

They have opened the door, but turned off the alarm, allowing free access by thieves (Peterson, 2003) (see Chapter 10, Section 10.3.4, CITES Cannot Stop the Bushmeat Trade).

Robinson and Redford (1991 *In:* Ngandjui, 1998) estimate a maximum sustained yield of duiker/*cephalophe* as:

- 60% of the annual population for species with short lives; less than five years;
- 40% for species with average lives; five to ten years; and
- 20% for species with long lives; more than ten years.

The blue duiker (*Cephalophus monticola*) and “red duiker”⁴²⁵ making up the majority of the bushmeat harvest in Southeastern Cameroon, fall into the 40% category. The average density was 2.78 blue duiker/km² and 7.35 “red duiker”/km². Meat is sold either fresh or smoked “boucané”.⁴²⁶

Peterson (2003) estimates that hunters can sustainably harvest the following percentage of the annual populations:

- Rodents, 13-80%;
- Ungulates, 4-25%, one species up to 50%;
- Primates, 1-4%;
- Chimpanzee and bonobos (the latter found in the Democratic Republic of Congo only, not in Cameroon or Congo Brazzaville), 2%; and
- Gorillas, 4%.

⁴²⁵ “Red” duiker “*Cephalophus rouges*”: Peters (*Cephalophus callipygus*), Bay (*C. dorsalis*), Gabon (*C. leucogaster*) and Black-Fronted (*C. nigrifrons*).

⁴²⁶ The smoking of the meat is very crude compared to Western methods of preparing a brine marinade to help flavor and desiccate the meat prior to smoking. In the forest, grided platforms about one meter off the ground are constructed and the meat is placed on top and in turn, covered in green leaves. A fire is made with green wood underneath the platform and the meat is smoked for about 24 hours. The outer layer of meat becomes covered in a black carbonized layer, which keeps out oxygen and bacteria to some degree. Inside this carbonized mass is “cooked”, not smoked, meat with a high moisture content that is still susceptible to decay by anaerobic bacteria, thus limiting the shelf life of meat processed in this manner. This shelf-life is relatively short.

Tropical forests can sustainably provide between 150-200 kg/km²/year compared to more productive savannas that can yield as much as 6-8 tons/km²/year in wildlife or 4.6 tons/km²/year in domestic livestock. Assuming a minimal daily protein requirement based on USA standards of 50 grams/average man/day, it is estimated that in Central Africa's forest areas, wildlife derived protein can support low densities of 0.3 people/km², while cultivation of staples can support 20-28 people/km² in carbohydrates (Peterson, 2003). Given a population of 84,440 people over 38,661 km², this amounts to 2.2 people/km² exceeding the ability of the area to support the local population, let alone urban centers, in protein requirements from bushmeat.

This is further substantiated by the fact that the Southeastern Cameroon Global Environment Facility (GEF) area of 3,866,100 ha (38,661 km²) could support a theoretical annual offtake of 107,477 blue duiker and 284,158 red duiker.⁴²⁷ Given a human population of 84,440 people, not considering commercial demands in places like Douala and Yaoundé, this would mean only 4.64 duiker/person/year indicating that this is unlikely to fulfill the protein needs of even the local population. Rural families consume bushmeat on the average of twice a week, whereas families associated with logging companies and buying power, consume bushmeat on the average of three times per week (BCTF, 1999). Peterson (2003) estimates that logging villages, which are artificially created, eat twice as much bushmeat as non-logging villages. This issue becomes even more serious if one looks at the fact that currently about 70% of Southeastern Cameroon has been turned into protected areas off limits to local communities, leaving local communities with only about 1,203,270 ha (12,033 km²) where they can legally undertake subsistence hunting in community hunting areas (see Table 11.19: Land use, Southeastern Cameroon). These areas risk to be “cleaned” by people, both Baka and Bantu, who depend almost entirely on bushmeat for their

⁴²⁷ 2.78 blue duiker/ km² and 7.35 “red duiker”/km² (Robinson & Redford, 1991 *In: Ngandjui, 1998*).

protein. Robinson and Redford (1991 *In: Ngandjui, 1998*) concluded that the current offtake of blue and red duiker is not sustainable in the long-term. Stopping outside commercial poachers and involving local communities in a sustainable harvest program is the only hope that species such as these, will survive.

Likewise, Peterson (2003) is concerned over the movement from traditional hunting of the great apes that was likely sustainable to uncontrolled commercial hunting, often by outsiders, associated with logging, fragmentation of the forests and increasing demands from both logging companies and urban centers. This risks to result in the extinction of these species in the next 10-50 years due to their very low fertility rate, about 25% of other mammals. On average, the female apes (chimpanzees, gorillas and bonobos) produce their first offspring at the age of 15 and continue producing once every five to eight years. A recent survey estimated that in protected areas of the Congo Basin, chimpanzees have declined by 91%, bonobos by 83% and gorillas by 100% (Peterson, 2003). A recent survey by World Wildlife Fund (WWF) in the Democratic Republic of Congo, where all bonobos are found, mostly in the Salonga National Park, estimates that the population has been reduced from 50,000 down to 10,000 from poaching (Eilperin, 2004). Tomlinson (2007) raises similar concern about over-harvesting of the forest elephant in the Congo Basin. Peterson (2003) believes the unholy alliance between loggers and hunters has turned the traditional hunting grounds of the Congo Basin into killing fields and questions, as conservation is currently being undertaken, whether the secondary partnership between conservationists and loggers, as will be discussed, can somehow magically end the killing.

In an attempt to control the bushmeat trade, an Association of Bushmeat Collectors (*Association des Collecteurs de Viande*) has been functional since about 2005 in Southeastern Cameroon. They are issued by government with

collecting permits that limit how much meat can be collected and sold; renewable every three months. They are the buyers, sellers and transporters of bushmeat, not the hunters. They are beginning to play an important role in self-policing and in stopping poaching by outsiders (Biko'o, *pers. comm.*). This a step in the right direction that needs to be linked to a management/monitoring program in the field that assures harvesting by local hunters is sustainable (e.g., development of management plans that have rotating open and closed hunting zones, using indices such as catch per unit effort and distance into each zone to assure a viable offtake, etc.).

11.11.6.5 Zones De Chasse Communautaires (community hunting areas)

These areas are also called Community Hunting Area, Cameroon/*Zone d'Interet Cynégétique a Gestion Communautaire* (ZICGC). These zones make up about 30% of the land use in Southeastern Cameroon. They tend to be along the major roads where people live and have a maximum width from any point on the road of about 25 kms.

Villages that form a ZICGC are paid 10% of all trophy fees (*taxe d'abattage*) and 10% of the concession fee (*taxe d'affermage*) from neighboring Professional Hunting Blocks/*Zone d'Intérêt Cynégétique* (ZICs) – a tax based on the size of the area, as well as 100% of the concession fee (*ammodiation*) in the ZICGC (Ngoufo & Bobo, 2005). For instance, CFA 30,000 (US\$ 46) per day is paid by Chasse Libre Hunters (Self-Guided Sport Hunters) with a minimum of ten days hunting – thus, CFA 300,000 (US\$ 460) and anything over ten days results in another CFA 300,000 regardless of whether it is one day or more. This is for rental of the Community Hunting Area, Cameroon/*Zone d'Interet Cynégétique a Gestion Communautaire* (ZICGC). The above money is paid to the *Eaux et Forêts* (Game Department), which in turn, pays the money over to the villages. In

some cases rental of a block may occur by a professional hunter. According to Ngonon and Defo (2004), the 14 ZICGCs are managed by nine Committees for Valorization of Natural Resources/*Comités de Valorization des Ressources Fauniques* (COVAREF) took in a total of US\$ 30,589/Euro 25,883 (16,824,044 CFA) in 2003 or an average of US\$ 2,184/year per community hunting area.

Cam Greig (*pers. comm.*) is a biologist with La Roche Pharmaceuticals, who is a third generation son of missionaries born and raised in Cameroon and, more importantly, a *Chasse Libre* Hunter (Self-guided hunter or better put, he hunts with traditional hunters as the Baka) who has hunted Cameroon extensively. He thinks the idea of the local community making money from guiding *Chasse Libre* Hunters, under current land uses in Southeastern Cameroon, is unrealistic, since to get to undisturbed areas where there is not so much pressure on the wildlife, that is areas that should be rich in forest elephant (*Loxodonta africana cyclotis*), bongo (*Tragelaphus eurycerus eurycerus*), forest (dwarf) buffalo (*Syncerus caffer nanus*), western forest sitatunga (*Tragelaphus spekii gratus*), giant forest hog (*Hylochoerus meinertzhageni rimator*) and yellow-backed duiker (*Cephalophus silvicultor*) among others, one must walk at least two to three days from the nearest village (e.g., 25 kilometers or more). He believes these “ZICGCs” in the Southeast are too narrow to make them ecologically and economically viable for *Chasse Libre* Hunting.

11.11.6.6 Revenue sharing from safari hunting

As noted above, revenue sharing (supposedly 10% of all trophy fees and 10% of the concession fee in Professional Hunting Blocks/*Zone d'Intérêt Cynégétique* [ZICs]) with the communities of Southeastern Cameroon is supposed to take place from profits associated with both safari hunting (99% white safari operators) and logging. Below is how revenue was supposedly shared from the 2000, 2001 and 2002 safari hunting seasons based upon concession fees only (Table 11.20).

Table 11.20: Income from safari hunting concessions, Forest areas (Southeastern Cameroon)			
	1999-2000	2000-2001	2001-2002
	Million CFA (\$US)/% Total	Million CFA (\$US)/% Total	Million CFA (\$US)/% Total
Village	9,809,811 (15,092)/9.5%	15,090,411 (23,216)/9.3%	15,737,556 (24,212)/10%
Communes (Local Government)	15,003,244 (23,082)/15%	31,363,136 (48,251)/19.4	27 (41,539)/17%
State	78,747,654 (121,150)/76%	115,095,908 (177,071)/71%	113,115,763 (174,024)/73%
TOTAL	103,560,709 (159,324)	161,549,455 (248,538)	155,853,319 (239,775)
Note: Includes trophy fee and concession fees. Extracted from: Mboh (2000, 2001& 2002), CFA 650/\$US Source: Prepared by Principal Author			

If there is a population of 84,440 people and we assume six people/household, between 1999 and 2002, money destined for the villages would amount to a high of \$US 0.29/person/year or \$US 1.72/household/year to a low of \$US 0.18/person/year or \$US 1.07/household/year. Once again, benefits from this “*Stage 3 CBNRM*” program (see Chapter 9, Section 9.7.6.4, CBNRM will not create a “middleclass” in rural Africa) would best be spent on common property benefits. It is understood that this money and populations are not distributed

equally so that some villages might benefit more than others. However, this does provide a global view of what it implies for the economy of the area.

When asked about transparency and accountability in how this money and revenue from logging is used back in 2001, the then Director of Wildlife, Denis Koulagna (*pers. comm.*), explained there was no mechanism in place to account for this. Introduction of such systems is critical to the long-term success of this program and is a major shortcoming in most CBNRM programs to date, resulting in corruption and misuse of the money at a local level. It appears that in 2003, a program called *Program de Securisation de Resources Fauniques* was being developed. At the level of the Commune (Local Government), the State had planned to appoint a *President de Commission Marché, Receveur Municipal* and a *Controler Financier* linked to a national *Agence de Regulations de Marché Publics* to assure transparency in how money is expended. Each village has a development committee with a president and treasurer, which would send three of its members to a Commune Commission that would consist of the elected mayor, development NGOs/organs such as WWF, GTZ, MINEF, SNV (*Service National des Vocations*, France) and Wildlife Conservation Society (WCS), and the *Prefet/Sous Prefet* representing the State along with the *Receveur Municipal*. This group would approve village projects to assure that there is no overlap with planned Commune level development. In the Southeastern Cameroon once the projects are approved, the Departmental Delegate of MINEF based in Yokadouma, would release money to the village for the project. According to Mouncharou (*pers. comm.*), ministerial changes and politics prevented this process from taking place, but plans still existed in 2005 to move in this direction. Currently, decisions to fund projects by the commune are made up of the mayor, a representative of the game department, the *Receveur Municipal*, the *Conciliator Municipal*, a technical person from the government (e.g., agriculture) and a representative from the village making the demand (Mouncharou, *pers. comm.*).

Ngoufo and Bobo (2005) have undertaken a detailed analysis of the strengths and weaknesses of community hunting blocks in Cameroon. A large number of proposed projects were never approved, implying high levels of corruption at all levels of government. Corruption and mismanagement is also a problem, including within individual COVAREFs (Ngoufo & Bobo, 2005). When money does get to the village level, currently there is no auditing (*Mouncharou, pers. comm.*; Ngoufo & Bobo, 2005). Lack of accountability, transparency and misuse of funds is a major problem, especially by game department officials who collect community funds from professional hunters. Women and the Baka are poorly represented in decision making. Communities are not able to adequately monitor offtake in their areas by professional hunters or in the Professional Hunting Blocks/*Zone d'Intérêt Cynégétique* (ZICs), so as to have an idea of how much money they should make or potentially to assure sustainability. To date, most funds have been used for common property benefits linked to schools, wells and construction of a pirogue. Since this process is only four to five years old, moving towards establishing transparent decision making processes will help overcome the above issues. Similar to CBNRM programs, money destined for the community COVAREFs must pass through government. The procedures are so complicated and the money must pass through so many levels of government from national through local, that most of it is siphoned off, little or none reaching the communities. The feeling is that the only hope for the COVAREF concept to work is to rewrite the basic legal statutes, giving these bodies more independence (*Messabiem, pers. comm.*). In recent times, the community hunting block rental concession fee (*ammodiation*) and the percentage of the trophy fee destined for the community is paid directly to the COVAREF by the hunter. The COVAREF can even issue a certificate of origin for the trophy (*Biko'o, pers. comm.*). One can only hope this is a dynamic process that evolves.

11.11.6.7 Income from commercial forest exploitation

A key question, which must be asked, is what percentage of the net profits after they are divided between stakeholders (e.g., logging companies, safari operators, national and local government, rural communities) really get down to the local level? Similar to safari hunting, commercial logging and forestry development tends to result in redistribution of wealth from local people to national elite (e.g., government, businessmen) and foreign companies, resulting in further impoverishment of local people (Witte, 1992; DFID, 2000 both *In: Forest Monitor*, 2001) (see Chapter 9, Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders). There are just too many middlemen between these rural people and their resources. Until local communities establish their own safari, tourism and logging companies, they will be on the losing end of the deal. Some will laugh and say how is this possible? Many of the timber fallers are Pygmies. With proper education and training, there is no reason they cannot run their own companies, initially joint venturing if necessary to gain certain technologies. As with wildlife, this comes back to land and resource tenure for Sub-Saharan Africa's rural communities (see Chapter 9, Section 9.9.2, Land and Resource Ownership, Key to Success).

According to Forest Monitor (2001),

“Forestry taxes in Cameroon are generally low. The cutting tax (*taxe d'abattage*) is 2.5% of the value of production while the concession tax (*redevance de superficie*) is approximately 5-10% of the value of production. When logging an area of forest for the first time, a company may falsify its tax declarations to conceal illegal logging”.

An estimate in 2003 of the “*Taxe de Superficie*” (*redevance de superficie*) (tax passed on hectares of logging concession) of each forest concession (UFA) brings in approximately (Mouncharou, *pers. comm.*):⁴²⁸

- Commune (Local Government) of Yokadouma: CFA 1,250,000,000/year (US\$ 1,923,076);
- Commune of Moloundu: CFA 600,000,000/year (US\$ 923,076); and
- Commune of Salapombe: CFA 200,000,000/year (US\$ 307,692).

It is unclear how much this is of the gross/net from logging, though it is assumed to be very minor. In theory, income to government from these forest concessions is divided with 10% going to the villages, 40% to the communes and 50% to the State. In 2003, this amounted to US\$ 315,384/year going directly to the villages or about US\$ 3.74/person/year or US\$ 22.44/household/year.

Peterson (2003) and Biko'o (*pers. comm.*) argue that little of this money gets to the local communities, most of this, as with money from hunting, being kept by the communes or other government officials.

In the school year 2000/2001, 15 students from the Yokadouma and Gari-Gombo commune approached the human resources officer (*chef de personnel*) of the logging company for financial aid, since they had heard from elders that benefits should be available from the logging company for this purpose. The company explained that they were already paying money to the government and to speak with the commune. The commune refused to acknowledge that it had money for students generated from logging. The students then went to the *prefet* who sent the commune a letter asking what had happened to the money given to the commune for the students. It was at that point in time that 10 of 15 students

⁴²⁸ CFA 650/US\$ in 2003.

received CFA 25,000 (US\$ 39)/student. Since then, CFA 50,000/student (Euro 77/US\$ 91 in 2005) is provided for ten students, but to obtain this funding is a major struggle. In 2004, the number of needy students has increased three-fold, but they struggle to increase the amount of financial assistance (Biko'o, *pers. comm.*). As with revenue from hunting, it will be necessary to put in place transparent and accountable systems to assure the proper use of income.

11.11.6.8 Community forests

According to Messer (2001),

“Cameroon is possibly the region’s most advanced country in terms of transferring usufruct rights over forests to rural communities, through the legal registration of ‘community forests,’ although a number of moot points and perplexities remain in terms of what is supposed to happen after registration”.

“Cameroon has introduced legislation for community forests, but the process is complex (Pénélon, 1996 *In: Roe, Mayers, Greig-Gran, Kothari, Fabricius & Hughes, 2000*) and corruption among those responsible for allocation of timber concessions has resulted in areas being allocated twice or even more (Phil Burnham, *pers. comm. In: Roe, et al., 2000*).⁴²⁹ It takes at least a year to register a community forest, whereas a timber concession may be allocated within a few weeks (Pénélon, 1996 *In: Roe, et al., 2000*)” (Roe, *et al.*, 2000).

According to Vande weghe (2004), the maximum area a community association can be allocated to manage is 5,000 ha compared to commercial logging concessions that can be as much as 200,000 ha in Cameroon.

Biko'o (*pers. comm.*), an Mpemu from Southeastern Cameroon explains that as of 2000, communities were able to form a committee and produce a management

⁴²⁹ No reference to this individual in Roe, *et al.* 2000.

plan (*Plan simple de gestion*) in order to be allocated 5,000 ha of forest. However, since the communities lacked technical skills, MINEF personnel produced all documentation including plans, selected committee members, who then were beholden to MINEF staff, and arranged so that the flow of any income from the forests requires signatures of the *Delegué* of MINEF at the provincial level, of the *prefet* and *sous prefet* and the *maire* (mayor) so that by the time the money reaches the local community, little or nothing is left (Biko'o, *pers. comm.*). As with money from safari and *chasse libre* hunting, there is no accountability as to what happens to the money. Peterson (2003) notes, not only Cameroon, but across the Congo Basin, while state rhetoric often appears to support community tenurial claims for restricted use purposes, in practice, communities remain marginalized by forest estate zoning as in the colonial era and one can add from zoning of parks and hunting blocks that exclude and impoverish rural communities, economically, nutritionally and culturally.

11.11.6.9 Adverse impacts of exposing Baka culture to a modern economy

One must ask - is the amount of money brought into Southeastern Cameroon, versus the disruption of traditional lifestyles worth it? This is something the people living in Southeastern Cameroon should be allowed to determine themselves as opposed to having it determined for them. Certainly, this amount is insignificant in their daily lives and in their nutrition, which is likely worse off because of compression into smaller and smaller areas and thus, decreased availability of natural resources necessary to survive. These resources are further reduced with the fragmentation of these forests by logging roads, opening access to outsiders who are mining the Pygmies' and local Bantu's resources for short-term gain, even encouraging them to join in the fracas.

Forest Monitor (2001) raises concern about adverse impacts on creating social conflicts, loss of cultural identity, corruption and under-/malnutrition linked to commercial logging that endures well after the forests are cleaned of their value and the logging companies have move on. Only a small fraction of the Baka and Bantu obtain jobs from the forestry, safari or NGO community. Schmidt (1998) noted that access to money is depersonalizing traditional relations within the Baka community, especially among the young, who often hide their money from their wives, and which liberate individual wage owners from past social obligations that assured survival, both physically and culturally of this small-scale society.

Traditionally, there was no social stratification within the Baka. Like in many hunting and gathering societies, there was a high level of equality, even women having a say in important decisions. Today, wage earning Baka often mock and belittle non-wage earners. In addition, wage earners often give up hunting, making their families dependent on others for bushmeat. Only those few working for safari hunting companies still get bushmeat. Meat is rarely bought with money from their salary. Alcohol abuse by the Baka male in a moneyed economy is also an issue. Smoking marijuana is part of their culture. Often the support of the family is left in the hands of the wife since the male is away working or drinking his salary. Since he is working, the male spends less time imparting traditional knowledge to his children. Often, the Baka women must work for very little for Bantu women to “win” back some of the money lost by her husband in buying locally made wine. Prostitution by the Baka female also becomes an issue (Schmidt, 1998). Like the San “Bushmen” (see Chapter 9 Section 9.7.6.4, CBNRM will not create a “middleclass” in rural Africa, LIFE Namibia Nyae Nyae Conservancy) and the American Indian, they appear to be caught between two worlds, one they cannot go back to and the other for educational and other reasons they are not ready to join. Thus, they drown their confusion by escaping into alcohol and possibly to some degree marijuana.

11.11.6.10 Sustainability of logging in Southeastern Cameroon/the Congo basin

Forest exploitation in the Sangha River Basin⁴³⁰ dates back to colonial times, accelerating in the 1920s when forest concessions were provided to private European concerns. Forests were cleared for coffee, oil-palm and cacao plantations and exploited for wild rubber, skins, meat and diamonds. Logging began taking off sometime in the 1970s, accelerating in recent times (Giles-Vernick, 2002). In 1995, four timber species represent over 60% of total timber exports from Cameroon: Ayous (*Triplochiton scleroxylon*) 30%, Sapelli (*Entandrophragma cylindricum*) 16.4%, Azobé (*Lophira alata*) 8.1% and Tali (*Erythrophleum spp.*) 6.2% (Verbelen, 2000). Vande weghe (2004) estimates that 17.2 million ha of Cameroon's forest were being exploited in 2002. In Cameroon and nearby Gabon, logging is moving into the interior of the country, the last old forests being under attack. In Cameroon, the cherished reserve Lake Lobéké has already been logged. Although Cameroon had 479 logging companies registered between 1998 and 1999, there were no more than 84 valid exploitation holders, of which 25 companies held 75% of the allocated areas with 15 year renewable leases (Vande weghe, 2004).

The Sapelli is of great importance to indigenous people. Medically, its bark and outer trunk have analgesic and anti-inflammatory effects used to treat head-aches associated with malaria, swollen eye infections and possibly as a bactericide. Large Sapelli are the unique host of the *Imbrasia (Nudaurelia) oyemensis*

⁴³⁰ The Sangha River Basin contains tracts of Southeastern Cameroon, southwestern Central African Republic (CAR/RCA) and northwestern Congo Brazzaville. Within this area, one finds the Lake Lobéké - Chute de Niki - Boumba-Bek/Dzanga-Sangha/Nouabale Ndoki *Tri-National De La Sangha* National Park created in December 2000, large protected areas in which Western donors and NGOs, along with political elites, have disposed rural communities from key resources they need for survival.

caterpillar, providing 75% of the protein eaten by Pygmies in the period when they fall from the trees locally called the “caterpillar season”. It is one of the best woods for pirogues and central supports for roofing in local homes (Forest Monitor, 2001).

Industrial exploitation of timber, often promoted under structural adjustment (SAP) and trade liberalization imposed by multilateral and bilateral creditors as a means of increasing government revenue (Ndoye & Kaimowitz, 1998; Forest Monitor, 2001), erodes the rights of local people in the Congo Basin who depend on forests. Forest tenure and traditional access rights are usually non-existent, which is exacerbated by the allocation of large areas of forest as timber concessions. The World Bank provided technical assistance helping to draft the current forestry law in Cameroon. There is concern that while the competitive tendering process introduced into Cameroon may reduce corruption, the bidding process is weighted 70/30 in favor of financial rather than technical merit that

“does not encourage the promotion of sustainable forestry management, and may indeed foster short-term profit-seeking over long-term sustainable forest management” (Forest Monitor, 2001).

Forest Monitor (2001) and Peterson (2003) do not believe that logging is sustainable, as being claimed by NGOs such as WCS and WWF, as well as donors such as the World Bank. Official government estimates suggest that sustainable log production levels are around 3.5 million m³/year in Cameroon, while actual log production is estimated to be between 4.5-5.1 m³/year (Forest Monitor, 2001). While forestry can lead to significant economic growth in areas with no history of forest exploitation, particularly since other indigenous economic activities are usually undervalued, the long-term ecological effects of this activity have not been properly assessed [Nouabalé-Ndoki Project (WCS), 1998]. Two of the most valued species in the region, Sapelli (*Entandrophragma*

cylindricum) and Sipo (*Entandrophragma utile*), have long growing cycles (e.g., age of harvested Sapelli using radiocarbon methods indicate 400-800 years old) and are being high graded, with second passes for less valuable species (Peterson, 2003) such as *bois blanc* from species such as Ayous (*Triplochiton scleroxylon*), used to make plywood, and Iroko (*Milicia excelsa*) (Barrado & DeGeorges, 1995) or Fraké/Limba (*Terminalia superba*), also used for plywood. In practice, long-term exploitation is based on alternate, less valuable species, as infrastructure develops, not on rotations of primary species. This may lead to economic growth, but the costs to sustainable development have yet to be evaluated [Nouabalé-Ndoki Project (WCS), 1998]. According to DeMadron and Forni (1997), on average one tree is logged/ha, a form of selective logging. According to Ford (2005),

“ ‘selective’ logging, in a silvicultural sense, is usually poor management, involving ‘high-grading’ that is, removing the most valuable species and individuals without concern for the species composition and growing conditions for the future forest. ‘Selection’ silviculture is the process in which individual trees are selected for removal from a stand, taking in consideration regeneration of those species (in other words, seedlings, saplings, and sub-commercial-sized individuals of that species are present and can be managed to grow to commercial size). Under selection management, the process of removing trees also contributes to creation of conditions, such as a seed bed, promoting desirable conditions for regeneration and growth of the future forest. Foresters categorize timber management into two principal strategies: even-aged management and uneven-aged management. Even-aged management deals largely with stands in which all trees are the same age. This is much more common in temperate and boreal zones than the tropics. Clear cutting and a few other techniques are examples of even-aged management. Thinning of even-aged stands can take out a commercial product but also leave a residual stand to continue growing. Usually, the best-formed trees are left, to concentrate the growing space on the most valuable product. Selection harvest is an example of uneven-aged management. Heterogeneous tropical forests are almost never clear-cut for their timber, because usually the majority of tree

species lack commercial value and many species have wood characteristics that make them very difficult to process into usable products”.

Vande weghe (2004) explains that “selective extraction changes species composition and the removal of giant trees 300-400 years, even 800 years old or more constitutes a skimming process that leaves no hope of reconstituting the heritage removed”.

Peterson (2003) points to evidence by evaluators regarding insufficient regeneration of Sapelli and Sipo. Likewise, Meder (1995) explains that preliminary carbon dating, aged wood cores of Sapelli and Sipo at 400-900 years, with no evidence that logging based on these two species is sustainable. Meder (1995) is concerned that with selective logging, “7% of the forest is cleared and approximately 20% of the stand is destroyed or damaged in the process”.

Many of the timber species fall into various threatened categories in the IUCN Red List of Threatened Species (Table 11.21) (see Chapter 10, Figure 10.6: IUCN species threat categorization.

Logging concessions tend to be broken into 40 units with 40 year rotation cycles, when the trees being harvested need rotational cycles of hundreds of years (Peterson, 2003). Research by DeMadron and Forni (1997) in Cameroon on Sapelli, Tali, Ayous and Fraké/Limba recommended an average rotation cycle for logging of 30 years, based on number of diameter classes lower than the Minimal Logging Diameter/*Diamètre Minimum d'Exploitabilité* (MLD/DME) for each species after deducting damage caused by logging on growth and on mortality. DeMadron and Forni (1997) recognize that this is a compromise on rotational period versus economics (loggers needing wood and government money). Growth rate estimates per species are based on forest surveys and growth rings by species.

Table 11.21: IUCN Red List classification of key tropical hardwood species from Cameroon/Congo Brazzaville

[Scientific Name]	Common Name(s)	Red List	USE
<u><i>Lophira alata</i></u>	Azobé/Azobe	VU A1cd ver 2.3 (1994)	Heavy durable construction work, harbor work, heavy-duty flooring, parquet flooring, railroad crossties
<u><i>Entandrophragma cylindricum</i></u>	Sapele/Sapelle/ Sapelli	VU A1cd ver 2.3 (1994)	Furniture and cabinetwork, decorative veneers, plywood, joinery, flooring, paneling.
<u><i>Entandrophragma utile</i></u>	Sipo	VU A1cd ver 2.3 (1994)	Furniture and cabinetwork, joinery, decorative veneers and plywood, boat construction.
<u><i>Milicia excelsa</i></u>	Iroko	LR/nt ver 2.3 (1994)	Suggested as a teak substitute. Joinery, boatbuilding, piling and marine work, domestic flooring, furniture, veneer, railroad crossties, cabinetwork, shop fittings.

VU = Vulnerable, EN = Endangered, LR = Lower Risk, (see Chapter 10, Figure 10.6:

IUCN species threat categorization,

http://www.redlist.org/info/categories_criteria1994.html (IUCN, 1994).

Source: IUCN (2004) for classification and WWF (2004b) for uses.

DeMadron and Forni (1997) also admit that it is difficult to predict future harvests - that is how well such trees will regenerate. ICRAF (2005) gives 50 years as the time when an Iroko can be harvested.

None of these estimates indicate how old these trees are at their maximum diameter/height. According to forester Reyes (2005),

"I forwarded your request to Dr. Frank Wadsworth, a retired forester here. He explained that unfortunately, there are no easy answers for your harvesting questions regarding the species below. Part of his reply follows: 'If the trees are produced

scientifically, harvesting is well deserved after they get to a size that is marketable. How much after is a matter of increasing value with stem size. The highest returns per year tend to be well after the trees reach the lower threshold of utilization. Harvesting trees at a minimum diameter is unwise, because much sapwood reduces the diameter of the more valuable heartwood. If this were to occur at 40 years, the volume of the tree at 80 years might be four times as great with wood value rising as the square of volume. It then resolves itself into a question of how long one is willing to wait.’ ”

Vande weghe (2002) raises concern that many question whether a second or third cut 30-40 years after the first is even profitable, “wood mining”. Forests are not clear-cut as in South America or Asia (e.g., for livestock, agriculture and logging) (see Chapter 5, Section 5.9.4.3, Deforestation in Sub-Saharan Africa’s dense humid forests today compared to the Amazon of South America). Since one to two trees are harvested/ha for a given species, the forest still appears structurally intact to a visitor. Economically, this is a form of mining rural Sub-Saharan Africa’s wealth for short-term gain. As discussed, equally devastating is the fragmentation of formerly impenetrable forests with logging roads, opening forests up to outsiders who are also mining rural peoples’ wildlife and other resources (e.g., ignames, honey and medicines) for short-term gain.

11.11.6.11 Certification for sustainable logging

No timber coming out of Central Africa has ever been certified by the Forest Stewardship Council (FSC) as being sustainable (Peterson, 2003), nor has certification been given to forest management operations, forest owners, manufacturers or timber traders in the Congo Basin (FSC, 2005).

In 2006, Transparency International ranked Cameroon 138 out of 163 countries, a number having the same score and thus ranking as one of the most corrupt countries in the world (see Section 11.6.3.2, Corruption). Key political and

military figures' involvement in commercial logging, from the President Paul Biya's son to generals, bodes ill for implementation of the forestry law, along with a transparent and accountable system of allocating concessions, transforming and exporting timber. Many of these political and military figures have been handed non-competitive access to logging concessions and then are known to have subleased to companies with a bad track record for playing by the rules. Linked to the neo-patrimonial client patron relationships described in Section 11.6.3 (Neo-Patrimonial Clientelism, The Big Man and "Cosmetic Democracy"), second only to oil in driving Cameroon's economy, the timber sector is characterized by the dialectic "‘Searching for power is to search for wealth, and searching for wealth is to search for power, because one leads to the other and vice versa,’" with a blurred line between public/private sector characteristic of such relationships (Forest Monitor, 2001).

In Cameroon, over 50% of the concessions not yet allocated for logging have been logged. Although the transformation of logs in-country provides added value, too many factories can result in over-harvesting to meet demands. The transformation capacity of factories in Cameroon soared from 1.2 million m³ in 1993 to 2.67 m³ in 1998 setting off a "race for timber" in which every means was permitted. Many of these factories are old European factories yielding mediocre products for valorization. Not just in Cameroon, but also throughout the region, management plans are falsified (Forest Monitor, 2001; Vande weghe, 2004), timber is transported illegally, including protected and under-dimensioned trees, and there is erroneous labeling of logs and felling of trees in prohibited areas. Globally, illegal timber is from 20-30% to 50% of total production (Vande weghe, 2004). The steady flow of reports of corruption in Cameroon's logging industry led the World Bank and Britain's Department for International Development (DFID) to confirm that in Cameroon "British and other international companies felled areas as large as 80,000 ha (200,000 acres) without permits; inspections

carried out by government-appointed observers in late 2001 and early 2002 show that almost every major logging company in Cameroon had acted wholly or partly illegally” (Transparency International, 2003). Many environmental groups are concerned that illegal logging could destroy as much as 67% of the Congo Basin’s forest in 50 years (Menezes, 2005). Searching the 2004 FCS website,⁴³¹ only Namibia, South Africa, Uganda, Zambia and Zimbabwe appear to have certified logging companies, but there are none from the Central Africa/Congo Basin area. Verbelen (2000) notes that the 1994 Cameroonian forestry law and its implementation has often been openly violated by concessionaires enjoying protection from high ranking authorities in Cameroon:

- “Less than 20 % of Cameroon’s unprotected forests remain free from logging development. Almost all logging in Cameroon is carried out in a very destructive way and illegal logging is a major issue...
- The log export ban (e.g., transformation of timber required in Cameroon) has not been implemented, ITTO (International Tropical Timber Organization) export figures for 1998 indicate that logs still made up more than 70 % of exports as opposed to transformed logs....
- The log export ban was lifted for two dominant species: Ayous and Sapelli. These exceptions allowed for much of Cameroon’s current logging trade to continue because these two species represented more than a third (>33%) of all logs exported in 1997. However, in August 1999, the government issued another set of guidelines that banned Sapelli exports while allowing for continued exports of Ayous and opening possibilities for the promotion of other currently ‘under-utilized’ species.
- Three subsidiary companies, all French owned hold more than 200,000 ha of concessions - in violation of the law. The companies are Sibaf-Bolloré, CFC-Thanry and Coron.
- 7 concessions (Thanry and Coron subsidiaries) were allocated through a discretionary process in 1996, violating the new legislation that called for a competitive and public allocation process.

⁴³¹ <http://www.fsc-info.org/>

- At least 21 of the 31 allocated concessions, *unités forestières d'aménagement* (UFA) did not go to the highest bidder. The Cameroonian government lost millions of dollars by not allocating concessions to the highest bidder.
- According to government records, during 1997-1998, 29 of 52 active licenses (56%) continued to operate even though the duration of their logging rights had expired”.

France is one of the largest bilateral lenders and aid donors to the region, French companies playing a significant role in regional forest exploitation (Forest Monitor, 2001). Does this imply that foreign aid is used as a political tool to buy influence for the donor country’s private sector?

Peterson (2003) provides additional support, referencing the name and official reports on illegal logging, possibly the majority of the timber coming out of Cameroon, believing this to be a form of neo-colonialism taking place in which African elites, especially governments, are in cahoots with European urbanites (consumers of wood) through intermediates, mostly French and German, but also Lebanese and Malaysian logging companies in the non-sustainable extraction of Central Africa’s most valuable resource, timber. Peterson (2003) calls this a “Reverse Robin Hood Scheme” in which the poor (rural communities) are robbed of both their timber and wildlife resources by outsiders, while NGOs more interested in fundraising and donor handouts, along with dysfunctional, corrupt, non-representative governments, promote misinformation that things are progressing. In essence, biodiversity, rural livelihoods and cultures are being destroyed under the guise of sustainable development, but development for whom? Biodiversity for rural subsistence economies represents wealth, empty forests being as serious a disaster for forest dwellers as a failed bank. Peterson (2003) argues that what we have is a clash of cultures, Western capitalized exploitation colliding with traditional hunter-gatherer cultures as the Western system expropriates biodiversity wealth from traditional societies, leaving them with little or nothing, while converting biodiversity wealth to cash that remains

with the urban/foreign elite. WWF in the name of forest conservation in Cameroon was given US\$ 2 million by the EU and another US\$ 3 million by European taxpayers after its 2001 conference on “Sustainable Management in the Congo Basin”. Peterson (2003) considers this a way of Europeans buying their own discount coupons for Central African hardwood that is cheaper than homegrown hardwood. Forest Monitor (2001) estimates that 45% of Cameroon’s timber is illegally harvested.

“The Centre for Environment and Development, a Cameroonian NGO, estimates that illegal timber accounted for about 45% of the country’s total timber production in 2000...Since May 2001, the British NGO Global Witness has been serving as independent forestry control observer in Cameroon, the only such post in the entire forestry sector of the Congo Basin. The impact of the mission, however, is still to be determined...Of the 25 forestry concessions Global Witness visited during its observer mission, almost all displayed serious legal discrepancies...The Société Forestière Hazim (SFH), a company owned by the Lebanese consul to Cameroon, was found to have illegally exploited 33% of its concession. The observer mission found that more than 20,000 ha of forest in the concession had been exploited in 2001, with a 25 billion CFA francs (US \$38 million) loss in earnings to the government and local communities...But the group also concedes that companies find it difficult to operate legally in Cameroon since permission to log invariably requires the payment of bribes...most of the companies known to engage in illegal logging have not been subject to sanctions sufficiently punitive to deter them. In other cases, legal sanctions, such as the revoking of logging licenses, have simply not been enforced” (Transparency International, 2003).

The Cameroonian government has “created a new unit to fight corruption in the sector. However, the fact that the unit was created within the under resourced forestry ministry – the very site of many of the alleged corrupt acts – has dented expectations that the new team will be effective” (Transparency International, 2005b).

Transparency International (2005a) indicates that illegal logging continues unabated in Cameroon. Studies by Greenpeace and Forests Monitor, by the British Department for International Development (DFID) and the IMF

“indicate the scale of corruption in forestry in Cameroon, as well as extensive tax losses for the state...two major groups of offence: illegal exploitation of the forest, in cases where there is no authorization; and anarchic exploitation, which refers to operations that are authorized, but where there are serious violations, such as uncontrolled logging, the exploitation of trees outside concessions, or inaccurate tax returns. The studies indicated that 41 out of 92 concessions are exploited illegally. One of the studies, which looked at 21 concessions, found that a tax loss of CFA 59.7 billion (US \$115 million) plus CFA 432 billion (US \$834 million) in damages over five years, amounting to around 25% of the government’s budget for 2004”.

11.11.6.12 Volume and value of timber from Cameroon/Congo Basin

The following offtake of timber are estimated, primarily by expatriate firms from the Congo Basin/Central Africa:

- Cameroon, ten European companies and one Lebanese parent company have 50% of the logging concessions in Cameroon. About 17.2 million ha logged. About 4.5-5 million m³/year exported (Peterson, 2003) [Vande weghe (2004) estimates 17.2 million ha exploited in 2002];
- Gabon, 327 separate concessions totaling 86,000 km² (8.6 million ha), the largest being 30,000 km² (3,000,000 ha) employing 2,000 workers. About 1,000 km² (100,000 ha) of forests degraded/year including in ecologically important “protected” areas such as Wonga-Wongue Reserve, the Gamba Reserve Complex and the Lopé Reserve. About 2.5 billion m³/year exported (Peterson, 2003) [Vande weghe (2004) estimates 12 million ha or 75% exploited in 2002];

- Congo Brazzaville licensing companies to log more than 50% of the 127,000 km² (12.7 million ha) of exploitable forests. About 1 million m³/year exported (Peterson, 2003). Tropical forests cover nearly 65% of Congo's territory. In the north of the country, the forest area has been divided into 21 logging concessions *unités forestières d'aménagement* (UFA) covering 8,984,749 hectares, of which eight have been awarded to logging companies, yet less than 10% of the total exploitable forest area has been exploited. Forestry is the second most important sector in the economy [Nouabalé-Ndoki Project (WCS), 1998];
- Equatorial Guinea licensing 30 companies, the larger foreign owned, to log 66% of the country's 22,000 km² of forests (Peterson, 2003);
- The Central African Republic licensing 9 companies to log 80-90% of the nation's 37,000 km² of forest in the southwest (Peterson, 2003); and
- The Democratic Republic of Congo licensing mainly German and Malaysian companies to log 10% or 118,000 km² (11.8 million ha) of its forests. About 1.5 billion m³/year exported combined from Equatorial Guinea, the Central African Republic and the Democratic Republic of Congo (Peterson, 2003).

About 10 million m³ from Sub-Saharan Africa's tropical lowland forests of the Congo Basin are exported annually, mainly to Europe and Asia, generating US\$ 100/m³ of exported wood or US\$ 1 billion/year in gross profits (Peterson, 2003). While the EU is the largest trading block (France number one, followed by Spain, Italy and Portugal) accounting for 64% of the round wood equivalents exported in 1999, China is the largest individual importer of timber from the Congo Basin (Forest Monitor, 2001). Similarly, FAOSTAT 2004 shows forest product exports from Central Africa/Congo Basin in 2003 valued at US\$ 1.1 billion (Table 11.22):

Table 11.22: Value of forest products exported from Central Africa/Congo Basin in 2003

Forest Products Exports	Value US\$
Cameroon	313,646,000
Central African Republic	47,877,000
Congo, Democratic Republic of	2,253,000
Congo (Brazzaville), Republic of	249,241,000
Equatorial Guinea	96,583,000
Gabon	367,021,000
Pulp & Paper (Mainly from DRC) Exports – Val	19,000
Total	1,076,640,000

Source: FAOSTAT (2004) with permission, UN & FAO.

Similarly, in 1999, the value of timber imported to Europe from the Congo Basin amounted to US\$ 600 million, Europe accounting for 64% of the world's import of tropical timber (Peterson, 2003). The only country in which logging has declined is in the Democratic Republic of Congo, due to the war, declining from 21 million ha in 1988 to 8 million around 2001, though talks were underway in 2002 to rapidly bring this back up to 33 million ha, in concessions given to Zimbabwe alone for its military aid (Vande weghe, 2004).

11.11.6.13 Let the Pygmies be the guardians of the forest

Although certain critical areas may need to be off limits, the Baka should be allowed to hunt and gather in the parks and protected areas, using traditional and or specified hunting techniques. The key is that they be allowed to carry out traditional subsistence hunting like the Eskimos in Canada and Alaska and that they be allowed to make a citizen's arrest of all outsiders they find in the forest so they can be turned over to MINEF.

The parks are for the most part completely undeveloped and parks in name only. Neither Cameroon nor the NGOs have the resources to police these areas. Meanwhile, fragmentation of the forests is opening them up to unsustainable exploitation for bushmeat and resources (Figure 11.3). Peterson (2003) provides some examples (see Chapter 10, Section, CITES Cannot Stop the Bushmeat Trade) specific to Cameroon:

- In 1990, 250 million kg/year of bushmeat were taken out of the 1,250 km² Korup National Park in southwestern Cameroon; and
- Tons of bushmeat/week are taken out of the Dja Biosphere Reserve and World Heritage Site in Southeastern Cameroon, helped by logging roads funded by the EU right up to the edge of Dja. Up to 150 elephants and 50 gorillas are killed each year within the boundaries of this reserve.

The Dja Biosphere Reserve is funded by the EU through Conservation and Rational Utilization of the Forest Ecosystems of Central Africa/*Conservation et utilisation rationnelle des Ecosystèmes Forestières en Afrique Centrale* (ECOFAC) operating in six protected areas in the region, including Congo Brazzaville and Gabon among others. The project was established in 1992 and has received US\$ 33 million to date (Forest Monitor, 2001).

In many cases, there is more game in the hunting areas protected by a safari operator than in the “Open Access” parks with little and/or inadequate protection (Barrado, *pers. comm.*). An option is to open up the undeveloped zones of the parks, allowing access to the people who have historically used them. Measures must be put in place to stop all outsiders. The past Director of Wildlife, Denis Koulagna (*pers. comm.*) believes that few tourists will ever visit these parks, most revenue from wildlife being derived from safari hunting. Even tourism in the more accessible savanna areas is quite limited. For instance, Bénoué National

Park, just south of Garoua with a beautiful camp and restaurant, receives only about 1,000 tourists per year (Mayaka, 2002). Thus, uneconomical “paper tiger” national park preservation areas make little sense in these isolated forests and many savannas, as opposed to dedicated natural areas co-managed with the local communities to meet the diverse array of wild products from these areas on which they depend for survival, while maintaining biodiversity and generating some income.

“If you allowed the Baka to continue to harvest and hunt the undeveloped parts of the parks they will not over use the zones (This can easily be determined and would become ‘their forests’ to protect and sustainably manage in collaboration with MINEF). The very nature of their travels requires a lot of walking and so they do not have the ability to bring back a lot of meat to sell (though this offtake should be monitored). Elephant hunting should be strictly limited, but is truly a historical heritage of the Baka (psychologically to be a Baka, he must be able to periodically participate in an elephant hunt linked to Djengi, the key forest god) (see Chapter 2, Section 2.1.8, Taboos as an Aid in Wildlife Management). I would even go so far as to propose that they be allowed to shoot elephants only when they are licensed and committed to bring out all of the meat. As a wild idea, a system could be set up to buy the ivory at the black market rates so you cut the middlemen out of the equation. When Cameroon finally gets its ability to sell excess ivory, like South Africa, the country will be able to capitalize on the stock of ivory from this regulated trade. Those hunters wishing to do this would be licensed and given strict quotas” (Greig, 2003).

With an estimated 30,000 elephants +/- 5,000 in Southeastern Cameroon (see Chapter 10, Section 10.7.2.1, “Enhancement” under the ESA linked to CITES, condemning more wildlife to die?, Enhancement Under the ESA as an Impediment to Conservation of Cameroon’s Elephant), there is no reason why annual meat quotas of elephants could not be provided to the Pygmies on a sustainable basis. Some additional concepts for consideration are (Greig, 2003):

- Do not allow any non-selective snare setting,⁴³² especially with steel cable, in these parks, but hunting only with true traditional means, nets, spears and crossbows (while allowing selective harvesting with shotguns could be considered). Further investigation and discussion is needed on this issue. (Vegetative snares might be considered, as this allows large animals to escape relatively unharmed. According to Wilcox & Nambu (2007) vegetative snares are legal in Cameroon but bushmeat cannot be sold commercially.);
- Allow the Baka to guide *chasse libre* hunters to “their forests” in return for wages (personal) and the daily fees (community) and ideally the trophy fee, which would be paid to an audited community account and strictly limited in what it could be spent on. Initially, put the Catholic Church or another involved non-profit organization on as a co-signatory for dispersal of funds to be spent on schools, teacher salaries and low cost pharmacies. Sooner or later, the local people must learn fiscal responsibility and this will come as more people from the community are sent off on scholarships to high school, university and technical schools with money raised by these funds;
- MINEF should deputize the Baka to confiscate the gun/bolt from any big game rifle found in their forest and confiscate any shotguns. They will do this if backed up by the *chasse libre* hunters. The guns would be turned over to the authorities in Yaoundé when the *chasse libre* hunter pays his trophy fees. (Note: This is happening with Dozo hunters on a World Bank funded program on the Comoé-Leraba Game Reserve in southern Burkina Faso; see Chapter 9, Section 9.8.9.1, Management of Comé-Leraba Game Reserve, Southern Burkina Faso);
- Officially deputize the Baka to destroy all wire snares;

⁴³² Studies around the Dja Biosphere Reserve suggest that there was a 25% loss of snared game from the meat rotting prior to being recovered (Vande weghe, 2004).

- License the Baka who wish to hunt elephants with a strict quota and means to sell the ivory for a fair price in a legal means;
- Shut down the forests to all outsiders not accompanied by the Baka. This could even be a licensed system run through the chief of the nearest village, allowing the village to get some profit out of the new system; and
- No roads would be allowed to be cut, so the safaris would be of low impact and the offtake sustainable. It would use a portion of the forest not being currently utilized by anyone legally and provide funds to drive advancement of the Baka into the 21st century while assuring its conservation and protection by the Baka. As they become more sophisticated in the services provided, they could up the fees charged to hunters and tourists (see Chapter 9, Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders).

Additional ideas include:

- Help Baka to create indigenous organizations to lobby for their rights, including land and resource tenure;
- Assess acceptable hunting methods, traditional and modern as discussed above, for the Baka/local community to employ;
- MINEF erect mobile barriers on major roads in Southeastern Cameroon to control and regulate a licensed commercial bushmeat trade linked to a monitoring system at community level to assure sustainability;
- Control Logging Companies transporting bushmeat and poachers;
- Intensive management of Community Hunting Area, Cameroon/*Zone d'Interet Cynégétique a Gestion Communautaire* (ZICGC)s for legal and controlled commercial bushmeat trade by “rotational hunting”. Vegetative snares might be used for the commercial bushmeat trade, the offtake being

monitored, and a rotational system – like fallow, established to allow zones to recover;

- Work with *chasse libre* hunting community to devise ecologically and economically viable areas. This may mean readjusting boundaries between current land uses; parks, hunting blocks and ZICGCs to make them more realistic as to what they can provide economically and ecologically – no use having unused and currently unprotected areas that will likely be mined for short-term gains; and
- Small game farming. There has been some experimentation in Francophone Africa with raising small game such as the cane rat/agouti or grasscutter, a rodent *Thryonomys swinderianus*. Peterson (2003) suggests investigating this species and also giant Gambian rats (*Cricetomys* spp.) as the two best candidates, along with giant snails (*Achatina* spp. and *Archachatina* spp.). However, as noted in Chapter 10, Section 10.3.4, CITES Cannot Stop the Bushmeat Trade, there are limited species available for such game farming and besides, as with fish farming, this will never negate the need to manage wild stocks of game in the forests or elsewhere (Bowen-Jones, Brown & Robinson, 2001 *In:* LWAG/DFID, 2002).

Vande weghe (2004) indicates that traditional territories occurred throughout the Congo Basin, extending 20-30 km beyond the farming lands (see Section 11.11.6.14, History repeats itself in new Mbam and Djerem National Park, Cameroon). With the relocation of communities along roads during the colonial and post-colonial eras, many of these traditional areas have been lost or disappeared into new landscapes (e.g., logging concessions, parks and hunting blocks), while “professional” bushmeat hunters are emptying areas formerly protected by communities – the notion of territory having become abstract. He believes that rather than eliminate these traditional hunting-gathering territories,

they should be resurrected and reinforced, using the community hunters to keep outside commercial hunters from abusing their resources. He also is a proponent of rotational hunting as practiced traditionally, in which monitoring would indicate when hunting success declines to the point that an area would be rested, while another zone within the community's territory would be hunted. The limiting factor will be population pressure.

These measures would provide a cash flow for the Baka and other groups, as well as a means to continue their traditional ways of hunting and gathering. The hunting licenses and other fees from *chasse libre* would benefit MINEF, and Cameroon would have more tourist money in terms of hotels, restaurants and travel.

Monitoring of the offtake would be a/the key to assuring that this traditional hunting is sustainable. Zouya-Mimbang (1998) believed in what she called auto-control by the local communities, which is similar to the pilot program of the World Bank in Burkina Faso *Gestion des Terroirs* (see Chapter 9, Section 9.8.9.1, Management of Comé-Leraba Game Reserve, Southern Burkina Faso) in which the goal is to have the local population manage, benefit from and protect "their" natural resources.

Giving the Baka/local community the feeling of pride and ownership over what they perceive as "their forests" is probably as important, if not more important, than just meat and money. Schmidt (1998) felt traditional user rights for the Baka to be critical, which is written into Loi N° 94/01, Article 29, (1). Zouya-Mimbang (1998) also supported this concept.

Being considered "second class citizens" and with few, if any, Baka with a university, let alone a secondary education, the future of the Baka and the many

Pygmy cultures across the tropical lowland forests of Central Africa looks bleak. Abilogo, *et al.* (2002) conclude that the “Baka must first establish greater economic independence from their Bantu ‘patrons’”. Almost all attempts to do so have relied on accelerating the process of sedentarization and engaging the Baka in permanent agriculture. Baka have no formal rights to the lands that they either presently utilize as hunter-gatherers or that could be used for agriculture. This needs to change. The notion of economic independence also assumes that new forms of social organisation can be developed that runs strongly counter to cultural norms (see Chapter 9, Section 9.7.4.2, Ignoring cultural constraints in institution building, LIFE, Namibia Nyae Nyae Conservancy and Section 9.7.6.4, CBNRM will not create a “middleclass” in rural Africa, LIFE, Namibia Nyae Nyae Conservancy). Moreover, the strength of Baka cultural values of “immediacy” might militate against development approaches relying heavily on benefits to be accrued in the distant future.

11.11.6.14 History repeats itself in new Mbam and Djerem National Park, Cameroon

As a sequel to this case study, in December 2003, two Cameroonian students from Tshwane University of Technology,⁴³³ both recent diploma graduates in nature conservation, were sent to an area north of the capital Yaoundé, around old German colonial capital of Yoko, to survey a hunting block buffer zone of the new Mbam and Djerem National Park (the old Pangar Djerem Game Reserve). This area is being developed, most likely with support from foreign donors, as though it was a primeval area on which humans had never trodden. This particular hunting block had been awarded to a banker⁴³⁴ in Yaoundé, who knew nothing

⁴³³ Armand Biko'o and Maliki Birosse Wardjomto – both master degree candidates in 2007.

⁴³⁴ On the positive side, Cameroonian students from Tshwane University in 2006/2007, in collaboration with the government and the village of Kong (Tikar ethnic group) on the western border of Mbam and Djerem Park, are establishing a *Zone d'Interet Cynégétique a Gestion Communautaire* (Community Hunting Area, Cameroon [ZICGC]) as a pilot program in which the

about wildlife, sustainable use, hunting or the local people. He wanted to make money. He also talked of opening the area to logging, with all of the potential consequences, as noted above, associated with fragmentation of the forest.

This area is inhabited by the Baveuk, Babouté and Bouté ethnic groups. These groups had been forgotten about by the French during the colonial times and for the last 40 years by the Cameroonian government. The area is a transition zone (ecotone) between forest and savanna, where both wildlife and plant species types are found from both biomes.

As the students were exploring, they came to a point where the local traditional hunting guide refused to go any further, even though it was well within the government designated safari hunting block. When asked why, the local guide said that he could go no further, since they were now entering into the hunting and gathering zone of another village. As with the Baka Pygmies (see Chapter 2, Section 2.1.4.2, Territory and wildlife management among the Baka Pygmies and other ethnic groups of Cameroon and Congo), the villages in the area had developed their own territories that they had managed for hundreds of years. The area was rich in game. When told that the people could no longer hunt or gather in the area other than 4-6 km into the forest from the village - an area already over-exploited - the people were visibly upset and saddened (Biko'o, pers. comm.).

There appears to have been no anthropological studies and no consultation with local people. With history repeating itself, common property systems are being

trophy fee and *ammodiation* (area rental) would go directly to the community (still to be negotiated) that would register as an enterprise and pay annual taxes. The community already recognizes the forest as belonging to them, has a land use plan (areas community hunts, versus non-hunting areas) and forbids bongo hunting or snare hunting. Details must be negotiated with government. In addition, the main river in the park is being zoned and various fishing communities empowered to manage and protect fishing stocks with their zone. As of 2008, the government retains the trophy fee, a major obstacle in assuring a buy-in by providing a significant profit to local communities; earning 17% of gross profit without trophy fee versus 32% with trophy fee.

replaced by centralized control that will create Open Access Resources to be mined by all comers. WCS is running this program (Gomse, *pers. comm.*) As Mayaka (2002) explains, “where state protection is faulty, wildlife is harvested under a *de facto* open access”. This will be exacerbated by the opening of the area for logging roads that will ease access by outsiders. Most likely, an expatriate safari operator/professional hunter will have come in with his territorial imperative given by a government acknowledged sub-contract from the banker. He will use repression against the local people. They will learn to hate white people, the game department and the government. At best, they will be poorer and marginalized from being cut off from a natural system that provided them with critical resources necessary to survive. At worst, they, like the Baka Pygmies, will be victims of eco-genocide.

The Garoua Wildlife College is training eco-guards recruited from the local community (Tarla, *pers. comm.*). The problem is that the laws are wrong. Will these eco-guards arrest their uncles, brothers, fathers and cousins? Vande weghe (2004) believes that anyone in such a community who would report another would be banned from the community, this only being feasible if acting against strangers, implying that for conservation to work, local community hunters-gatherers must be integrated into the management of such areas, as has been advocated throughout this book, to undertake legal harvesting of natural resources. Then the role of the eco-guards would be primarily to arrest outside interlopers and occasionally a local who breaks the laws. Modern conservation is alienating Sub-Saharan Africans from the concept of conservation, - something they have practiced for hundreds of years - but now government's can do it better. CBNRM mistakes are continually repeating themselves and no one seems to be learning from the historical past. Plans for co-management agreements between park authorities and local communities in Cameroon that allow access to various resources (e.g., land, pastures, water, straw, fish and various plant products)

(Tarla & Bachirou, 2004) could possibly begin changing relationships between these stakeholders, if based upon true negotiations and not mandates from MINEF.

All of this is happening even though, as noted, law n°94/01 of January 1994 on forests, wildlife and fisheries, Article 26, states that the social environment of local communities must be respected when creating new protected areas. They maintain the right to normal use if this does not compromise the objectives of the area. If they are stopped from accessing the area or moved, they must be compensated (Bauer, 2003). Murphree (1998) sums up the problems presented in this case study very eloquently,

“The institutional requirements of a local natural resource management regime...include social cohesion, locally sanctioned authority and co-operation and compliance reliant primarily on peer pressure. This implies a tightly knit interactive social unit spatially located to permit this. However, while social topography suggests ‘small-scale’ regimes, ecological considerations tend to mandate ‘large-scale’ regimes...Dissonance arises when larger ecosystem regimes are imposed rather than endogenous (coming from within the community). Such impositions in the form of ecologically-determined project domains often force together social units which have not negotiated between each other or worse still cut through existing social units. In so doing they concentrate on ecological sustainability at the cost of ignoring the institutional sustainability on which it depends”.

The feelings of local people towards Cameroon’s current approach to Western-driven conservation is well expressed by the extract from a motivational letter by a Jean Antono⁴³⁵ from Southeastern Cameroon to the Head of Department of

⁴³⁵ Jean Antono, C/O Kourai N. Bernard, *Ministre de la Fonction Publique et de La Reforme Administrative*, Yaounde, Cameroon, Tel: 237-950-88-51 To: Attie Botha Department Of Nature Conservation, Tshwane University Of Technology, B/Bag X680, Pretoria 0001 South Africa. Translation, words in parenthesis added.

Nature Conservation at Tshwane University of Technology in requesting a “Shikar Scholarship” to study nature conservation:

“I am a young Baka Pygmy, native to Southeastern Cameroon. The Baka are the people of the forest – we depend on it exclusively for our survival. It was given to us by ‘our God.’ However, today this forest is impoverished and divided into zones (hunting blocks, parks and logging concessions) that do not respect our way of life. As a consequence, we have been compressed to the edge of the roads next to Bantu villages living in indescribable misery with no ability to be heard by government.

I would like to be enrolled in the department of nature conservation, with a goal of learning what you ‘Whites’ mean by nature conservation and then return and sensitize my people about the dangers of destroying the forests and on the other hand regroup the Baka so that we ourselves can save ‘Our Forests’.

11.11.7 Case Study Bongo in the Congo (Brazzaville)

“The unrestrained corporate lust for energy, hardwood, medicines, and strategic metals is still a considerable threat to indigenous communities, arguably a larger threat than conservation. But the lines between the two are being blurred. Particularly problematic is the fact that international conservation organizations remain comfortable working in close quarters with some of the most aggressive global resource prospectors, such as Boise Cascade, Chevron-Texaco, Mitsubishi, Conoco-Phillips, International Paper, Rio Tinto Mining, Shell, and Weyerhauser,...to renounce their corporate partners, they would forfeit millions of dollars in revenue and access to global power...” (Dowie, 2005).

The non-Bantu in the northern forested region of the country are the Baka and Aka Pygmy ethnic groups, estimated at 30,000 inhabitants [Nouabalé-Ndoki Project (WCS), 1998].

The economy of Congo is based almost solely on the exploitation of its natural resource base. The petroleum sector dominates the economy. Tropical forests cover nearly 65% of Congo's territory [Nouabalé-Ndoki Project (WCS), 1998]. Of the 21.5 million ha of forests, approximately 50% of (12.7 million ha) are classified as productive forest suitable for timber exploitation, the remainder being flooded or semi-flooded forests or located in irregular terrain not amenable to commercial exploitation. In 1995, 37% of the total forest area of Congo was held in logging concessions, *unités forestières d'aménagement* (UFA), rapidly increasing since 1996. In the north, forests cover 17.3 million ha of which 8.9 million ha are exploitable (Forest Monitor, 2001). In the north of the country, the forest area has been divided into eight logging UFAs awarded to logging companies [Nouabalé-Ndoki Project (WCS), 1998].

“In northern Congo none of the active forestry units have a management plan, although some companies are now developing them” (Forest Monitor, 2001).

As noted in the Cameroon case study, many question the sustainability of mechanized logging in the Congo Basin, including Congo Brazzaville, along with consequential adverse social and environmental impacts.

One way to reduce the risks of relying on economic growth, based on single resource economies, is to diversify into other economic activities, such as tourist safari hunting (TSH), which depend on sustainable yields of forest resources. The positive aspects of forest exploitation *vis à vis* tourist safari hunting is that it takes advantage of the “edge effect” of secondary forest along logging roads. Certain game species, especially bongo (*Tragelaphus euryceros*), dwarf buffalo (*Syncerus caffer nanus*), giant forest hog (*Hylochoerus meinertzhageni*) and yellow-backed duiker (*Cephalaphus sylviculator*) appear to congregate along these edges, feeding on the lush vegetation that grows there [Nouabalé-Ndoki Project (WCS), 1998].

Vande weghe (2004) mentions elephant, buffalo, gorillas and forest duiker being attracted to secondary forests, but not chimpanzees and most other arboreal monkeys.

This “edge effect” along logging roads also simplifies the hunting method to be used and increases the success rate of the tourist safari hunter. Logging roads are used extensively by big game hunters to access and locate trophy individuals of many game species, game being taken within a few kilometers of these roads. The ease of this hunting, including the possibility of returning each day to a permanent base camp, is important since many of the clients able to pay for such activities are elderly and are likely incapable of enduring the rigors of the harsh forest environment [Nouabalé-Ndoki Project (WCS), 1998].

On recommendation of a 1995 field planning mission, consisting of the Wildlife Conservation Society (WCS) of Nouabalé-Ndoki, GTZ (German aid agency), Safari Club International (SCI) – represented by the principal author, and the Ministry of Environment and Forests, the Government of Congo granted Congo Safaris permission to undertake a pilot season in 1995-96 with a special quota of eight bongo antelope (MEF/NNP, 1995). Following the relatively successful 1995-96 pilot season, Congo Safaris signed a ten year contract with the Ministry for exclusive TSH rights to the Kabo UFA. Congo Safaris was responsible for:

- Education (public relations);
- Revenue sharing;
- Wildlife population monitoring and management; and
- Anti-poaching.

plus development of a land use plan agreed on by stakeholders delimiting tourist safari hunting zones, village hunting zones and protected areas, a community

sensitization program to eliminate indiscriminant snare hunting in favor of shotgun hunting and cessation of commercial bushmeat hunting for species of value to safari hunting (e.g., bongo, buffalo, yellow-backed duiker, giant forest hog and sitatunga). Giles-Vernick (2002) describes similar measures taken around the Dzanga-Sangha reserve and Dzanga-Ndoki national park in the nearby Central African Republic (CAR). Peterson (2003) discusses such attempts by WCS/CIB logging company (*Congolaise Industrielle des Bois*) in addition to hauling in beef from Cameroon, but questions the success of stopping everything from snaring to the circulation of large calibre rifles lent out by powerful men in the region. Tomlinson (2007) also raises the issue of government officials being behind most poaching in the nearby CAR, hiring Pygmies and providing them with rifles to kill elephants. Tourist safari hunting quotas were as follows (Stockenstroom, *pers. comm.*; SCI African Advisory Board, 1997) (Table 11.23):

Table 11.23: Trophy hunting quotas, Congo Safaris, KABO UFA

Species	1996 Kabo	1997	1998 Quota - 2
		Kabo/Pokola	Camps
Buffalo	4	6	10
Bongo	8	10	15
Sitatunga	4	6	10
Giant Forest Hog	4	5	8
Bushpig	8	8	12
Leopard	0	4	6
Blue Duiker	8	8	10
Bay Duiker	8	8	10
Peters Duiker	8	8	12
Gabon Duiker	5	4	6
Black-fronted Duiker	5	5	7
Yellow-backed Duiker	8	8	10

11.11.7.1 Logging around Nouabalé-Ndoki National Park

In June 1999, a formal contract was signed between WCS, the logging company CIB, the Congo Ministry of Environment and Forests (MEF) and Congo Safaris called “Project for Ecosystem Management of the Periphery of the Nouabalé-

Ndoki National Park” (Peterson, 2003). According to Peterson (2003), this allowed CIB to more than double its concession area from 480,000 ha to 1.2 million ha, while the workforce increased to 1,200 workers (80% coming from outside the region), earning from US\$ 1.50-2.0/person/day. This resulted in an artificial community of from 10-16,000 residents in total, counting family, merchants and hangers-on, with bushmeat as their main source of protein.

Desiring quotas/limits as to the number of outsiders that could be employed in logging, in the mid to late 1990s violent demonstrations took place by the *Front National de la Sangha*, representing the forest community (Forest Monitor, 2001).

Prior to this doubling of the logging concession, CIB was paying US\$ 2.5 million (CFA 1.5 billion)⁴³⁶/year in taxes or 6.5% of the gross and US\$ 1.7 million (CFA 1 billion)/year in salaries or 4.5% of the gross (likely half of it going to a few highly paid expatriates) while making gross annual profits of US\$ 38 million (CFA 22.5 billion). Other reports estimate salaries in the logging concession at US\$ 30-40/month/employee with maximum annual salary outlays of US\$ 27,800 when the workforce was 695. Net profits to the company are difficult to obtain since other costs, such as transport and equipment depreciation, are not provided (Peterson, 2003). This compares to safari hunting with about 35% being paid over in the form of taxes and community support.⁴³⁷

⁴³⁶ CFA 589.95/US\$ in 1998 (Peterson, 2003).

⁴³⁷ In Chapter 9, Section 9.5.1, CAMPFIRE, Zimbabwe; 10% of the gross profits go to CAMPFIRE. In Chapter 9, Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders; the community would get about 9.5% of the gross profits from hunting in direct benefits and salaries and the government 25.6% of the gross profits – a total of 35% of the gross.

11.11.7.2 Closure of bongo hunting

While a draft national safari hunting management plan for Congo [Nouabalé-Ndoki Project (WCS), 1998] was put together in collaboration with WCS, Congo Safaris and the government, in September 1999, the government, for no apparent reason, closed bongo hunting. Evidence strongly points to a WCS bongo researcher (Paul Elkan), who opposed hunting of this animal, especially expansion of hunting being proposed by Congo Safaris, by bringing in the well known and highly respected Haute Chinko Safaris from the Central African Republic (CAR/RCA). In June 2000, a meeting of stakeholders took place in Brazzaville to discuss the issue.

- Wildlife Conservation Society (WCS) represented by Paul Elkan;
- Congo Ministry of Water and Forests/MEF represented by Director of Wildlife, Marcellin Agnagna, Dominique Nsosso (Licensing) and Jean Pierre Ondaye (Congolese counterpart to Paul Elkan);
- Congo Safaris represented by Eric Stockenstroom; and
- Safari Club International/SCI represented by the principal author.

Mr. Elkan estimated that conservatively, there are 400-500 bongos in the area. Based on his presentation and the 1999 report, *Rapport Preliminaire Sur La Population De L'Antelope Bongo Dans 'UFA De Kabo, Nord Cong* (Elkan, 1999), he believed that the artificial salines in the hunting zone permanently attracted bongo from the nearby study area of Mombongo (Note: Congo Safaris believes there are other factors – see below – for the concentration of bongo and other wildlife in their area). There was concern that concentrating bongo by artificial salines risked to increase disease transmission, impact local vegetation and affect the bongo social system. It was recommended that bongo concentrate

around natural salines/bais and that no hunting should be allowed within a 3 km radius of a natural saline/*bai* (DeGeorges, 2000).

During April and May 1997, 18 bongos, five yellow-backed duikers and two sitatungas were found dead or dieing in the region of Nouabalé-Ndoki National Park and the Kabo UFA. Due to the difficulty of observing wildlife in the forest environment, it is believed that the mortality was much higher. Cameroon also reported at least five dead bongos. At the same time, in the peripheral areas south and west of Lake Lobéké National Park, Cameroon, the success rate for trophy bongo significantly declined. However, many of the safari operators found no dead bongo, leading some to conclude that possibly the bongo migrated to other areas where the food supply or other environmental conditions were more amicable (Wengert & de Gentile, *pers. comm.* both *In:* DeGeorges, 2000). Elkan (2000) found bongo to displace as much as 75 km.

The death and/or migration of bongo is believed to be due to a prolonged drought which weakened the bongo and was followed by an outbreak of biting flies, *Stomoxys* sp., which were able to reproduce through two to three lifecycles more than in wetter years, increasing their numbers. It is believed that this fly may have caused stress on wildlife contributing to general fatigue, malnutrition and susceptibility to a lung parasite identified by a visiting veterinary from South Africa (Huchzermeyer, 1997; Huchzermeyer, Penrith & Elkan, 2001). The South African vet believes that Congo Safari's artificial salines could have provided the vital minerals needed to survive these unusual conditions (Stockenstroom *pers. comm.* with Huchzermeyer),⁴³⁸ one of the reasons there were minimal observed mortalities in the hunting area.

⁴³⁸ F. W. Huchzermeyer, Pathology Section, Onderstepoort, Veterinary Institute (OVI), South Africa – who visited Congo to investigate dieoff.

Some people believe that the disappearance of bongo in Southeastern Cameroon was caused by Baka going on a “bongo poaching rampage” determining that if there were no bongo for the white man to hunt, he would leave and their forest would be returned to them (e.g., “revenge killing” as one sees among the Maasai in East Africa – see Chapter 9, Section 9.7.8.2, “Politics of despair”, Southern Maasailand “Tarangire Ecosystem”) (Mouncharou, *pers. comm.*). If this is even a minor contributing factor, it can show how desperate people, who had conserved the bongo and other wildlife for hundreds and thousands of years, can be turned against nature into exterminators through imposition of Western conservation models. Thus insensitive interventions by the West without the inclusion of the Baka and similar hunting-gathering groups, dependent on wildlife and other resources for survival, can actually turn them against conservation and result in destruction of the very resources on which they have traditionally been dependent. However, this allegation has never been proven.

Mr. Elkan, based upon the bongo dieoff of 1997, wanted only six bongos taken in the area (DeGeorges, 2000):

- Two Bongos in the West side of the Ndoki River, Kabo UFA;
- Two Bongos East Side of Ndoki River, Kabo UFA; and
- Two Bongos Pokola UFA;

Mr. Elkan also wished Congo Safaris to stop the use of artificial salines.

Mr. Stockenstroom explained that safari hunting in the Kabo UFA (480,000 ha) was sustainable, but that the Congo legislation of having the bongo on Annex I (Integrally Protected) was the problem. He also saw that one of the reasons hunting was closed is that certain groups were afraid of other safari operators coming in, resulting in an expansion of hunting. He felt Mr. Elkan’s estimate of

400-500 bongos to be extremely low. Within a 16 km radius of his hunting camp, he knew of at least 250 bongos based on known herds and solitary males (DeGeorges, 2000).

Mr. Stockenstroom explained that bongo is the flagship species for Congo. Hunting clients will not come to Congo unless this species can be hunted, nor will they pay top dollar (e.g., US\$ 25,000/2 weeks of hunting). All other species (dwarf buffalo, giant forest hog, sitatunga, yellow-backed duiker) are secondary and cannot be marketed without this “Flagship Species”. That is to say, the marketing of hunting will only succeed if a sufficient quota of this species exists to allow an economically viable safari industry to operate (DeGeorges, 2000).

Mr. Stockenstroom explained that eight bongos were the minimum to make his safari operation economically viable. He explained that with an annual quota of eight bongos, hunter success and trophy quality of the 28 bongos, which he had taken over the past five years, were excellent and thus, there was no justification to diminish the quota to six. Mr. Stockenstroom said that he would be the first to request a quota reduction, if he saw the quality of trophies declining, and/or felt that hunting was detrimentally impacting the bongo or other game populations (see Chapter 9, Section 9.7.7, Inappropriate or No Wildlife Monitoring to Assure Sustainability). Furthermore, trophy quality, averaging between 29-30 inches, had been maintained, as well as hunter success – unlike in the area south of Lake Lobéké National Park across the border in Cameroon, where both trophy quality and hunter success significantly diminished from what appears to be a combination of over-harvesting (quotas not based on any scientific data, uncontrolled-poaching and over-shooting quotas in attempts to obtain good trophies for clients at all costs – shoot three bongo to get one good trophy), as well as the ecological factors described above (DeGeorges, 2000).

Trophy hunting is based on harvesting older males of the species (exception - gemsbok where females are also harvested as trophies), who have had the opportunity to pass on their genetic qualities. Based on a 2% offtake of the annual population for trophies, and a very conservative estimate of 400-500 bongos in the Kabo/Pokola UFA Complex, eight mature male bongos per year could easily be harvested on a sustainable basis, maintaining the economic value of the species through ensuring acceptable trophy quality by conservatively harvesting mature males. Nowhere in Africa has the harvesting of 2% of a population been shown to have an adverse impact on the biology of an antelope species (DeGeorges, 2000).

According to Mr. Elkan, the dieoff of the bongo was primarily males. In herding populations, one male may breed with many females. The success of a population usually depends on having a viable population of females, which appear to exist within the Kabo/Pokola UFA (DeGeorges, 2000).

Elkan of WCS could show no proof that safari hunting had been harmful to the bongo/game populations around the Nouabalé-Ndoki Kabo complex. In fact, the greatest population of game in the area was within Congo Safari's hunting area. WCS wished to place the cause for this as the use of artificial salines (salt licks), rather than the other factors mentioned above, such as revenue sharing, anti-poaching, land use plan developed by stakeholders establishing safari, traditional and logging company hunting areas, discouraging non-selective wire snaring in favor of selective shotgun hunting, village sensitization of hunting low value species and wildlife monitoring. WCS had no justification for recommending six over eight bongos, other than erring on the side of the Precautionary Principle (see Chapter 9 Section 9.2, THE CRITICAL LINK, CBNRM AND ADAPTIVE MANAGEMENT IN AFRICA, for definition). It was felt that two key issues that needed addressing were (DeGeorges, 2000):

- A Joint Monitoring Program between WCS/Congo Safaris/MEF, which would be used to help set annual quotas; and
- Addressing Transparency and Accountability in benefits to communities.

It was recommended that as part of the joint monitoring program, trophy quality be recorded for bongo and other trophy hunted species. A statistically significant decline in trophy quality over a three to five year period should raise a “Red Flag” of concern – “Threshold of Potential Concern”, or TPC, which could indicate anthropomorphic or environmental changes impacting the viability of the species.

Mr. Stockenstroom agreed to stop using artificial salines, for the right to have eight bongos on quota, but suggested that an experiment be established, where another area, outside his hunting area, would be established with artificial salines. Bongo would be monitored to see if they are drawn from his hunting area, where they are now concentrated. This would help determine which is most important, the establishment of artificial salines and/or the other factors in the integrated program established by Congo Safaris, such as the hunting block serving as a safe haven for bongo and other wildlife (DeGeorges, 2000). On June 21, 2000, a final meeting of stakeholders was held between (DeGeorges, 2000):

- Marcellin Agnagna, Director of Wildlife, (Ministry of Environment and Forests (MEF));
- Jean-Marcel Apesse, MEF;
- Paul Elkan, MEF/Wildlife Conservation Society (WCS);
- Eric Stockenstroom, Congo Safaris; and
- Principal author, Safari Club International (SCI).

Based on basic agreements from the previous meeting, an “*Arrette*” that is an official document, legalizing the hunting of bongo in the Kabo/Pokola UFA, would be produced for the Minister’s signature. This would then be published in an official government gazette, *Journal Officiale*. This would result in the bongo being moved from Congo’s Annex I (Integrally Protected) to Annex II (Partially Protected). This could take a few months. This would be preceded by an authorization to resume bongo hunting in the next week to allow safari activities to start soon. Draft copies would be emailed to Congo Safaris and the SCI Africa Office for their input (DeGeorges, 2000). Mr. Elkan asked Mr. DeGeorges why he did not come over and join the other side. Mr. DeGeorges can only suppose that this refers to the anti-hunting animal rights movement.

Bongo hunting never reopened. The key reasons appeared to be:

- The local WCS researcher being against the sustainable use of bongo;
- The safari operator believes that the logging company needed a “Green Label” showing sustainable timber management in order to market timber in European Union (EU) countries and cut an agreement with WCS to help provide this in return for their opposing hunting within their logging concession (Stockenstroom, *pers. comm.*). Similarly, Peterson (2003) believes that WCS was in cahoots with the German logging company CIB (*Congolaise Industrielle des Bois*). CIB used WCS as a front to push the idea of obtaining a “green label”, such as through FSC (Forest Stewardship Council), while WCS used CIB to support its publicity campaign that would help in fund raising and donor support. CIB could be pressured to push for the expulsion of Congo Safaris, as well as keep investigative journalists and other NGOs out of the area. CIB also gave up a mostly swampy, difficult to access 260 km² (of which only 160 km² was exploitable) Goualogo Triangle directly abutting Nouabalé-Ndoki

National Park, as a gesture towards conservation. However, Peterson (2003) explains it was the local people and not CIB, who really sacrificed, giving up their renewable resources, as all over the subcontinent, to neo-colonial Western conservation NGOs, in this case WCS. Attempts by CIB to obtain green label certification from the Dutch Keurhout Foundation⁴³⁹ were stopped when Green Peace challenged the award before a Keurhout Board of Appeal and the award was withdrawn (Peterson, 2003);

- Western donor funding [e.g., World Bank's/UNEP's/UNDP's Global Environment Facility (GEF), USAID's Central African Regional Program for the Environment (CARPE) in the Congo Basin, GTZ, etc.], which, though not sustainable, allowed WCS to create its own anti-poaching forces and development activities with little need for the private sector to help generate sustainable income to drive the program – or so they thought. Peterson (2003) contends that CIB contributes US\$ 150,000-200,000/year in kind to WCS, while donor/tax payer contributions from the West to WCS for this program amount to just under US\$ 1 million/year; and
- Convincing the Minister through trips to the USA and other politicking to close bongo hunting.

This is based on personal communications with the safari operator and personal observations of the principal author from 1995-2002 in dealing with this conservation program and the key stakeholders.

⁴³⁹ Kerhout Foundation ceased activities on December 31, 2003, the Netherlands Timber Trade Association (NTTA) taking over validation for sustainable forestry (Malaysian Timber Council, 2004).

11.11.7.3 Collusion between WCS, CIB and unsustainable logging/conservation

Western donors such as USAID, the World Bank and the Global Environment Facility (GEF) are diplomatic agencies working closely with national governments, making it difficult for conservationist NGOs taking their money to openly

“oppose government corruption or inaction, which is often the primary cause of environmental degradation in countries of the Third World; government backing of extractive industries in fragile forest areas is one of the most common outcomes...This has given rise to the ironic observation that the large international NGOs are allying themselves with forces that are destroying the world’s remaining ecosystems, while ignoring or even opposing those forces that are attempting to save them from destruction...Reluctance to oppose harmful practices (e.g., oil companies, miners, loggers, and pharmaceutical companies on indigenous lands) in foreign countries is even greater where the NGOs are largely out of sight of First World eyes (e.g., Congo Basin) and under the protection of governments that are unconcerned with protection of the environment” (Chapin, 2004).

Conservationist NGOs who had helped strengthen indigenous institutions to fight for their rights in the 1990s, have tended to join the other side, turning away from these indigenous groups when they begin fighting for land and resource tenure. These NGOs are afraid to stand up to the multi-nationals, governments, and Western bilateral and multi-lateral donors who are often in cahoots with each other (Chapin, 2004).

Peterson (2003) sees the relationship between WCS and the logging company CIB as coming up short,

“a conservation organization had formally disrobed and slipped into bed with a logging company:”

- Lacking transparency (no standardized independent assessments);
- Inappropriate funding (loggers and tropical wood consumers helping to pay for conservation); and
- Greenwash effect in which loggers exploit conservation groups for public relations purposes, without necessarily changing their ways.

There is no FSC green label to date, regardless of the public relations campaign, CIB lacking proof of both sustainable logging and wildlife management even though it is considered a key pilot program for the World Bank financed African Forest Law Enforcement and Governance (AFLEG) process (Peterson, 2003). Of grave concern is the rate of road construction around Nouabalé-Ndoki National Park. LaPorte and Lin (2003) found,

“using remote sensing imagery estimated that the total length of logging roads established...in the last 30 years was estimated to be more than 6,000 km (mostly from CIB, south of the park)—two times the total length of primary roads in the entire country”.

Logging roads can also be seen on the Cameroonian side (west) of the Sangha River in this imagery.

“Between February 2001 and April 2002, primary and secondary roads increased by more than 500 km in active concessions surrounding the Nouabalé-Ndoki National Park (south and north/northeast of park). In the Mokabi UFA (operated by Rougier) and in the Lopala UFA (BLP-BITAR) (north of park), 166 km and 176 km of roads were built during this time period, respectively. This translates into an annual rate of 0.05 to 0.09 km of logging road constructed per km² of forest” (Laporte & Lin, 2003).

In the north, a dense network of parallel secondary roads can be observed averaging only 850 meters apart (Laporte & Lin, 2003). This extensive road network has major implications, as discussed under the Cameroon case study above, not only for sustainable logging, but also for sustainable bushmeat harvests, providing easy and uncontrolled access for outsiders to mine the region's natural resources. The question that must be asked is at what point are the logging roads and secondary vegetation preferred by certain species excessive to the point of being detrimental versus beneficial to wildlife?

Peterson (2003) alleges that in 2002, CIB logging trucks were still transporting unlicensed hunters and making steel bullets in their workshops that could be placed in shotguns shells to shoot large animals, including elephant. During the mid 1990s, as many as 200-300 elephant were being killed each year by villagers living in the CIB concession land (Peterson, 2003). Reminiscent of the colonial past,

“eco-guards armed with automatic rifles patrol the buffer zone around the national parks, an activity many local people regard as a gross violation of their traditional rights. In some cases, elephant poachers have been hired as eco-guards in an attempt to stop them poaching. It has been reported in the past that these guards often intimidated local people, and allowed their former poaching colleagues to pass freely through checkpoints but confiscated local people’s small amounts of game. The system has created distrust and antagonism between some conservation workers and local people and, in certain places, has strengthened the position of some of the best-connected poachers who are commissioned to hunt trophy animals” (Forest Monitor, 2001).

Basically, CIB and WCS have taken over from the state; having created a fiefdom in which they control what information comes out of the area and who is allowed in (Peterson, 2003). Transnational companies operating as surrogate states, forcing local people to rely on them for basic services such as health and education, do not foster sustainable development that is equitable and lasting, the

standards for infrastructure and quality of services varying considerably (Forest Monitor, 2001). This is reminiscent of the colonial period when large concessions were given over to private companies.

This may be considered a form of neo-colonialism in which non-representative dysfunctional states give *de facto* rule to the private sector and NGOs, deferring their responsibilities from building roads, schools and clinics to policing and anti-poaching. It follows a trend in the region dating back to colonial times. Beginning in the 1890s, German and French colonial powers delegated administration of the Sangha River Basin, in which this case study and Southeastern Cameroon fall, to European concession companies for the purpose of extracting timber, game meat and skins, wild rubber, diamonds and establishing cocoa and coffee plantations (Giles-Vernick, 2002) (see Chapter 3, Section 3.1.4.1, Francophone colonial Africa, Central Africa). In fact, Vandeweghe (2004) is concerned that large forestry companies, and for that matter NGOs substituting for the state, is a relapse back into the paternalism so decried in the Belgium Congo and elsewhere in colonial Africa. It seems that little has changed.

11.11.8 Dzanga-Sangha and Empire Building, Central African Republic

The 1,220 km² Dzanga-Ndoki National Park and the 3,359 km² Dzanga-Sangha Special Reserve that serves as a buffer zone to the park, were both established in 1990. These protected areas, literally just across the border from Nouabalé-Ndoki, Congo, were started by the same person, Mike Fay, who helped secure donor funding⁴⁴⁰ and support for both the Central African Republic and Congo protected areas. The World Bank and IMF encouraged both forest exploitation to generate

⁴⁴⁰ Donors included USAID, U.S. Fish and Wildlife Service, GTZ (Giles-Vernick, 2002).

FOREX, as well as the creation of protected areas, local stakeholders losing in both cases, to foreign logging companies and Western NGOs. Similar to WCS and the logging company, CIB, in the Congo and reminiscent of the colonial period, WWF is the *de facto* manager of these areas supposedly in collaboration with government. WWF imposes rules on local people, limiting their access to the resources of the region, limiting where they can fish, what, how and where they can hunt, collection of other wild foods and farming. This forces people to poach, resulting in a lost opportunity to assure sustainable harvests (Giles-Vernick, 2002). Giles-Vernick (2002) argues, as during colonial times, WWF preaches a degradation narrative and the inability of local people to sustainably manage their resources, as the reason that foreign intervention is needed to save virgin forests which have been exploited and sustained livelihoods for hundreds of years. This is also useful for fundraising, such as from the IMF/World Bank who, as in Cameroon, pressured the Central African Republic government into creating these protected areas.

“Conservation efforts in the Sangha not only disrupted livelihood practices but also transgressed Mpiemu (dominant tribe in area) historical, cultural, and social knowledge, values, and practices concerning relations between people and environment embedded in doli⁴⁴¹” (Giles-Vernick, 2002).

Heavy-handed anti-poaching by military-uniformed guards, evoking the coercion and brutality of the colonial military past and concessionary companies’ guards, has failed, as one can argue, due to a conflict of cultures; the donor funded international conservation community’s vision of nature being worthy of protection for its intrinsic value and aesthetic pleasure, versus rural people who see these natural systems as storehouses of resources critical to their survival and economic livelihoods. Similar to the Baka of Cameroon, the Mpiemu believe that

⁴⁴¹ Among the Mpiemu ethnic group, “a category of historical and environmental knowledge and a way of perceiving and characterizing environments and the past”.

the government sold their forests to WWF, who is more interested in the future of wildlife than people. Local people have learned to hate whites, even wishing that someone kills them (Giles-Vernick, 2002).

Giles-Vernick (2002) describes conflicts between what U.S. Peace Corps and WWF Central African counterparts taught children - preserve the forest resources versus what they learn at home, to live off the forest in and around the Dzanga-Sangha National Park (see Section 11.11.11, Andohahela Lemur Reserve, Madagascar). She goes on to say, and this will be true in Madagascar and throughout rural areas of Sub-Saharan Africa, where people live subsistence lifestyles,

“it remains unlikely that Mpiemu (tribe) would ever adopt conservationist discourse of depletion and loss in the forest wholeheartedly and unequivocally. The forest was still a place of past and potential exploitation, as well as a source of materials (game, palm wine, building materials, and foods) that not only were crucial to their livelihood but also help them leave behind gendered, ethnic and generational persons and to transact social relations”.

Although this historian confuses “conservation” with the “preservationist policies” that most Western NGOs and donors impose on Africa’s rural communities, what she concludes is critical. Rural, subsistence-living Africans will likely not buy into “preservationist policies” that currently dominate. What these last two case studies have demonstrated is that if “conservation” in the Congo Basin’s forests and elsewhere is to be successful and thus, Sub-Saharan Africa’s natural areas are to survive current and future human population pressures, communities must be helped to sustainably manage and harvest the myriad of natural resources from these systems enriching livelihoods, as opposed to current policies that impoverish them and disregard entrepreneurialism.

The creation of local empires by conservation NGOs, at the expense of local cultures and sustainable natural resource management, is common across the subcontinent in the 21st century. As things currently stand, the way logging and conservation is being undertaken in the Congo Basin is not only not sustainable, but is destroying cultures, and is a major socio-ecological accident awaiting, if it has not already happened.

11.11.9 Kenya Wildlife Service (KWS) – Living on Donor Handouts, Negative Impact on Kenya's Wildlife Outside Parks

In East Africa,

“a general reluctance on behalf of most conservation authorities to implement community conservation policies fully reflects continued concern over loss of power, equated with loss of control” (Roe, *et al.*, 2000).

11.11.9.1 Donor driven conservation

The following case study shows how Western donor aid, along with influence by Western animal rights groups (Powys, 2003), is resulting in major habitat loss and the extermination of wildlife. As a result of the publicity gained from burning the 12 tons of ivory in 1989, as described in Chapter 10 on CITES, Kenya was the recipient hub of US\$ 150 – 250 million in foreign aid (see Chapter 10, Section 10.4.4, Leakey and Ivory Burning, Good for Kenya but No One Else). This large infusion of foreign aid allowed the Kenya Wildlife Service (KWS) to live independently of wealth generated from the sustainable use of its wildlife. This is reflective of donor- and fund-driven conservation budgets, in which expenditures were not related to obtaining added value from the resource, resulting in failure to reach financial sustainability in addition to alienating landowners from conservation. Costs to run the Kenya Wildlife Service (KWS) grew from US\$

11.5 million/year to US\$ 30.3 million/year in seven years, while income increased respectively over the same time frame from US\$ 5.9 million to US\$ 18.3 million, well below expectations, with 10-30% not collected (leaked), implying corruption. KWS is the most extreme example of a budget-funded agency responding to political imperative at the expense of conservation and operational effectiveness, with some 80% of the expenditure on non-park activities. KWS was given too much money too fast without the legal institutional or managerial capacity to absorb it, while landowners were given too few user rights and the most valuable use (safari hunting) was banned (Child, *et al.*, 2004a *In:* Child, B., 2004).

11.11.9.2 Impact of donor driven conservation on private lands

Wildlife populations plummeted outside parks owing to poaching and habitat loss as landowners, in trying to survive, were opting out of wildlife as a land use, an example of the negative power of state agencies (Child, *et al.*, 2004a *In:* Child, B., 2004), just the opposite of southern Africa.

The majority of Kenya's wildlife resources are found on private, group and cooperative lands and on Samburu/Turkana trust lands, outside protected areas. Though disputed by Richard Leakey (Leakey & Morill, 2002) as misinformation put forth by David Western (eventually Leakey's replacement in the Kenya Wildlife Service (KWS), it is commonly known that in the late 1980s/early 1990s, 80% of Kenya's wildlife lived on the 80% of the land lying outside its parks and reserves (DeGeorges, 1992a). Ouko and Marekia (1996 *In:* Juma & Ojwang, 1996 *In:* Emerton, 1998) estimate between 65% and 80% of Kenya's wildlife is outside National Parks and Reserves. Due to the antiquated preservationist policies of KWS, wildlife on private, group and cooperative ranches has been, and is still, seen as an Open Access Resource competing with livestock and of no

long-term economic value (DeGeorges, 1992a). While individuals and/or groups have title deeds to the land, they lack ownership over the land's most valuable commodity, wildlife. The drastic decline of wildlife and wildlife habitat since the early 1990s can be attributed to the pathetic protectionist policies of KWS, giving no incentive to ever-increasing rural people to maintain these ranches in natural systems. In April 2000, at CITES COP 11 in Nairobi, the principal author was shocked as he drove along the rift valley escarpment road from Nairobi to Naivasha. Down in the valley, what had been bush was now a neat quilt of squares, small farms expanding into what had been wildlife habitat less than ten years ago. If current preservationist policies of the Kenya Wildlife Service (KWS) continue in parallel with population growth and land hunger, one day soon only wildlife will be found in parks and protected areas (see Chapter 5, Figure 5.6: Movement of small farmers, mainly Kikuyu into former Maasai grazing areas in Kenya resulting in major conflicts in the 20/21st centuries).

Privately-owned Laikipia ranches, many owned by independently wealthy, often expatriate, landowners, continue to serve as strongholds for wildlife, including elephant and rhino populations. Laikipia is the only district where wildlife recorded an increase in numbers, up 12% between 1977 and 1994, with many of the other range lands seeing wildlife decreases ranging from negative 40-80%, and even important areas such as Amboseli/Kajiado District with a decrease of negative 15% and Maasai Mara/Narok District wildlife populations down by – negative 32% (Grunblatt, Said, *et al.*, 1995; Rainy & Worden, 1997 both *In:* Barrow, *et al.*, 2000) (see Chapter 5, Section 5.7.1.3, Improperly planned land tenure and impacts on wildlife and conflicts between pastoralists and small farmers, Amboseli and Maasai Mara, Kenya).

Clive Aggate, Kifluku, Laikipia, Kenya

In the 1980s, Clive (*pers. comm.*) and George Aggate of Kifluku Farm, Laikipia Kenya, built a stone wall around their 3,644 ha (9,000 acre) farm and shot out all wildlife. They then approached the Kenya Wildlife Service (KWS) and explained that they had the right to control problem animals and since wildlife had no direct value to them, they were all problem animals bringing in tick borne diseases, and competing with livestock for pasture. Until they could obtain reasonable value from wildlife, they didn't want wildlife on our land, being no different than any smallholder, and one wonders why Sub-Saharan Africa's wildlife and its habitat is disappearing (DeGeorges & Pellek, 1991; DeGeorges, 1992a).

It may be a surprise to some that Clive and George are white Kenyans, but as they explained, they were behaving as would any smallholder, regardless of race, taking the necessary steps to survive. Eliminating wildlife resulted in decreased livestock dipping (in pesticides against tick borne diseases, etc.) from twice a week to once a month and significantly increased range carrying capacity (DeGeorges & Pellek, 1991; DeGeorges, 1992a). It is estimated that wildlife transmitted diseases cost ranchers US\$ 37/km² in Laikipia (Grootenhuis, 1996 *In:* Emerton, 1998).

Clive challenged the Kenya Wildlife Service (KWS) to take him to court. They refused, fearing that legally he would win the case and set a precedent for other smallholders in Kenya (DeGeorges, 1992a).

"I like elephant as much as the next man and I do what I can to protect them. But not when the bastards turn my fencing to spaghetti and eat up my entire corn crop", (British farmer in Kenya *In:* Rosenblum & Williamson, 1990).

Many Laikipia ranchers (e.g., Jasper Evans) recount with fervor how they might shoot lions as vermin preying on their livestock. They explain that if permitted to sell their lions as sport hunting trophies, they would be willing to allow some losses of livestock without taking extreme actions. This is not unique to Kenya, but typical of ranch country all over Sub-Saharan Africa (DeGeorges, 1992a). A male lion can bring as much as US\$ 12,000 or more in trophy fees alone, costing as much as US\$ 75,000 (Beukes, *pers. comm.*) to over US\$ 100,000 (Goldenberg, 2005)⁴⁴² for the total hunt.

In the mid-1990s, the principal author flew up to Laikipia with Lance Norris, the then Safari Club International (SCI) president, on a visit to Gilfrid Powys and Kuki Gallmann of Laikipia to discuss conservation issues in Kenya. The stone wall was still standing as a monument to the archaic centralized control of wildlife that is failing as critical wildlife habitat all over Kenya goes under the plow, being sold off by pastoralists who see no value in wildlife nor a future in pastoralism, to be engulfed by a wave of small farmers and commercial farmers who also see no value in wildlife. The policies of the Kenyan government are linked to its colonial past and to Western animal rights groups who wish to save Africa from the Africans. Allowing private land ownership on group, cooperative and private ranches, while failing to give full ownership of wildlife, allowing free-market forces within reason (e.g., ethical hunting, no canned hunting) to determine economic use, may be one of the biggest reasons why wildlife, but more importantly wildlife habitat, is disappearing in Kenya and Sub-Saharan Africa in general. As a result, landowners are either selling off the habitat to

⁴⁴² Charles Goldenberg, Premier Safaris (Booking Agent), premiersafaris@earthlink.net :Includes: 1) US\$ 54,000 daily rate for 24 day hunt, 2) US\$ 22,000 government trophy fees assuming two cats, three buffalo, 17 antelope, crocodile and hippo, 3) US\$ 2,000-6,000 community development surcharge on trophy fees, 4) US\$ 4,000 other government fees, daily conservation fees included (\$100 per day) US\$ 2,100 to US\$ 3,000; Hunting License US\$ 600; firearm/ammo import fees US\$ 600; trophy export -documentation fees \$300, 5) US\$ 8,400 observer fees, daily fee is from \$250 to \$450 and should average + US\$ 50/day government conservation fee, 6) US\$ 1,800 trophy preparations, 7) US\$ 6,000 plane charter to hunting camp, 8) US\$ 3,000 Hotels, etc. before and after hunt, 9) US\$ 3,000 International plane flights.

small farmers and wheat schemes and/or opting themselves for other land use (see Chapter 5, Section, 5.7.1.3, Improperly planned land tenure and impacts on wildlife and conflicts between pastoralists and small farmers, Amboseli and Maasai Mara, Kenya).

11.11.9.3 Secretive culling by Kenya Wildlife Service (KWS) living on foreign aid/donor handouts

Meanwhile, “there are more paradoxes to be found in Kenya. Whereas the Government opposes the culling (and hunting) of elephants, which is necessary in Southern Africa to avoid the grand scale destruction of forests and vegetation, Kenya Wildlife Service is engaged itself in culling operations. For example, 30 lions have been culled in the Aberdare National Park within the last 2 years in order to reduce predation on the rare Bongo antelope and the giant forest hog. This is done in great secrecy, because it is obviously not in line with the official position. As the scouts of the Kenya Wildlife Service (KWS) were unable to do the job, they had to call in a former cattle ranch manager to shoot the lions” (Anderson, 2000).⁴⁴³

Additional statistics from Laikipia rancher Gilfrid Powys are provided in Chapter 10, Section 10.8, THERE'S AN AFRICAN LION JUST AROUND THE CORNER). Until Kenya stops allowing Western animal rights groups, such as International Fund for Animal Welfare (IFAW) and Western donors, to control their wildlife policies, wasteful acts such as this lion slaughter and “revenge killings” by Maasai will continue along with a rapid loss of habitat as Kenyans opt for other land uses such as small and commercial farms.

11.11.9.4 Human/wildlife conflicts

Post independence in the 1960s saw many of the large scale ranches change hands with settled smallholders and cooperative or community ownership, in order to

⁴⁴³ Clive Anderson is pseudo-name of Rolf Baldus of GTZ's Tanzania's Selous Program. Article written for *Safari Time Africa* just before CITES COP 11, in 2000, Nairobi, Kenya. Now back in Germany at baldus@intafrica.com.

accommodate political pressure for land. The Laikipia Highlands have become a patchwork of marginalized small-scale indigenous farmers interspersed with sophisticated European ranchers. An estimated 30% of the Laikipia area has been lost to smallholders. It is estimated that there are 600-700 smallholders on the edge of Laikipia with 2 ha (5 acres)/smallholder managed as marginal agricultural lands which give significant crop yields one in every three to five years. People living under these management systems rely on remittances from family emigrating to urban environments in order to survive. Small farmers bordering cattle/wildlife farms experience major wildlife/human conflicts. Zebra and buffalo spend their days on the ranches and their evenings eating maize and other crops grown by the small farmers. Racial conflicts began to develop over this issue between the rich White rancher and the poor Black farmer (Powys, *pers comm.*). Other hidden costs to small-scale Sub-Saharan African farmers living next to wildlife are livestock/wildlife diseases and predation (e.g., lion, leopard, mongoose, hyena, cheetah, jackal, baboons), competition for grazing land, the cost of damage to boreholes by elephants, the emotive impacts of human death from wildlife (e.g., by elephant, hippo, buffalo and lion) and loss of food production (e.g., by raiding buffalo, elephant, baboons/monkeys, bushpigs and warthogs).

In the early 1990s, antagonism between the ranchers and small farmers became serious. To overcome this problem, the Laikipia Wildlife Forum was initiated in 1991 after Guilford Powys and Kuki Gallmann visited Zimbabwe to observe how benefits from wildlife accrued to local people living in rural Africa, “CAMPFIRE” (Powys, *pers. comm.*). This is a registered not-for-profit body made up of small farmers and large ranchers who have joined hands to resolve conflicts and to develop this region of Kenya (Powys, *pers. comm.*). A similar forum exists in the Machakos area south of Nairobi.

11.11.9.5 Potential value of sustainable use in Kenya

A Presidential Decree in 1977, with urging from the World Bank, banned hunting and effectively stopped consumptive utilization of wildlife in Kenya.⁴⁴⁴ Until 1990, only a handful of ranches were permitted to crop wildlife. In 1990, the Kenya Wildlife Service (KWS) introduced a limited pilot wildlife utilization program across six districts. In Laikipia, game cropping is licensed on 30 individual ranches and 11 community landholdings.

Game cropping generates very low returns to landowners estimated at US\$ 0.20 – 0.40/ha/year or US\$ 20-40/km²/year or just enough to cover the cost of disease transmission from wildlife to livestock, as noted above (Table 11.24).

Table 11.24: Return/hectare from alternative land uses in Laikipia, Kenya

Activity	US\$/Ha/Year 1995-1996	Return on capital % per annum
Wildlife Tourism	4.40 – 4.70	2.20
Game Cropping	0.20 – 0.40	0.30
Livestock	0.20 – 1.40	0.70
Agriculture (High potential lands only)	132.50 – 166.20	4.70

Source: Elliott and Mwangi (1997, *In: Barrow, et al., 2000*). Reproduced with permission of IIED, www.iied.org.

DeGeorges and Pellek (1991) found that most Laikipia ranches struggled to generate significant revenue from eco-tourism in the early 1990s, lacking the scenic beauty and game concentrations of parks like Amboseli and Maasai Mara.

⁴⁴⁴ Tanzania did not need any help from the World Bank to close hunting. Its first President, Julius Nyerere, took care of that. Hunting was closed in Tanzania from 1973-1984 (Bonner, 1993) or 1985 (Kibonde, *pers. comm.*) the reason being given because of corruption (Bonner, 1993), but also because Nyerere pursued a socialist agenda nationalizing the economy and discouraging the private sector of foreign investment (Lamb, 1982 & Bonner, 1993), as well as foreigner visitors (e.g., tourists) who might have negatively influenced what would become a failed experiment (Bonner, 1993). When hunting reopened, it was nationalized with TAWICO, the Tanzania Wildlife Corporation.

At the time, the London Rhodesia Company (LONHRO) had two ranches in Laikipia with inadequate returns from both livestock and eco-tourism to make them economically viable. As noted earlier, attempts to use the abundant Laikipia wildlife to feed refugee camps was rejected by USAID officials (see Section 11.8.3.1, “Food for Peace” or “food for poverty”, Western donor impacts on food production and wildlife management in Laikipia, Kenya). Thus, multiple use of wildlife, both consumptive and non-consumptive, seems to make sense on most of these ranches, likely combined with some livestock.

Laikipia landowners obtain less than 5% of the final value of wildlife products (Averbeck, 2001). No wildlife products are allowed to be sold as souvenirs in Kenya. Skins can only be tanned with hair off. Thus, many zebra skins have been shipped to South Africa, Botswana, Zimbabwe and Namibia and the added value of transformation from tanning and then retailing is obtained outside of Kenya. In 2004, the landowner was paid US\$ 100-200/Grade one zebra skins, which when sold on the tourist market, can sell for US\$ 1,000 dollars (Averbeck, 2001). In 2004, Grade 1 zebra skins in South Africa sold for R 9000/US\$ 1,450 when they could be found (Lewis, *pers. comm.*).

The biggest return to the landowner would be from trophy hunting, which is still closed. Elliott and Mwangi (1997 *In:* Averbeck, 2001) concluded that without significant change in economic incentives, wildlife will gradually be removed from all land in Laikipia, except where it supports tourism ventures or where the landowner has non-economic reasons (cultural, aesthetic) for conserving wildlife.

In 2003, some tourism in Kenya existed, but suffered after the embassy (1998) and resort (2002) bombings in Kenya and because of local political violence over the last few years. This violence peaked in early 2008, sparked by a disputed presidential election, but ultimately over populations growing at 3.9%/year, land

scarcity, high unemployment and rising ethnic tensions (see Chapter 5, Section 5.7.1.3, Improperly planned land tenure and impacts on wildlife and conflicts between pastoralists and small-scale farmers, Amboseli and Maasai Mara, Kenya). Landowners are struggling to get their rights back to own wildlife. It is believed that trophy hunting is where the biggest money can be made over the widest areas, many of which have little or no tourism value.

Comparison to South Africa and Zimbabwe

In comparison, Limpopo Province, which in 2000 contained 49.0% of all the exempted wildlife ranches in South Africa, depending on annual rainfall and thus offtake, the gross income from wildlife of extensively railed game averaged US\$ 6.73/ha/year (R32.32/ha/year)⁴⁴⁵ from 1995 to 1999, as opposed to farmed ostrich and crocodile. This was primarily from overseas and local hunting, venison and live sales, since only 7.9% of the game ranches cater to tourists [e.g., in the year 2000, for all of South Africa a total gross income of about US\$ 124 million (R 843 million)⁴⁴⁶ was generated on exempted game ranches⁴⁴⁷ of which only 4.7% of the revenue was ecotourism] (Bothma, 2005). The African Advisory Board (2000) valued South Africa's game industry in 1999 at US\$ 140,062,252, that included the overseas hunter (US\$ 38.4 million including taxidermy), the biltong hunter (US\$ 75 million), live capture and sales (US\$ 25 million), the venison market (US\$ 1.7 million) (see Chapter 10, Section 10.3.4, CITES Cannot Stop the Bushmeat Trade) and taxidermy. Similarly, Van der Merwe and Saayman (2002 *In:* Ebedes, Reilly, Van Hoven & Penzhorn, 2002 *In:* Bothma, 2005) estimated that overseas hunting has a gross value of US\$ 39 million (R238, 158, 000) in 1999.⁴⁴⁸ Allowing complete utilization of wildlife could generate large amounts of income for landowners and government (Table 11.25).

⁴⁴⁵ Between 1995-1999, averaged Rand 4.8/US\$.

⁴⁴⁶ Using annual average of about Rand 6.8/US\$ in 2000.

⁴⁴⁷ Exempted game ranches are high fenced and so designated by government so that game can be utilized year round at the discretion of the land owner

⁴⁴⁸ Use Rand 6.1/US\$ average for 1999.

Table 11.25: Actual and potential value of wildlife utilization in Kenya

	Actual (US\$ Millions)	Value (US\$ Millions)	Potential Value (US\$ Millions)
Game Cropping	0.34		1.00 – 2.00
Farming			0.75-1.50
• Crocodile/Ostrich	0.27		
• Butterfly	0.02		
• Bird Shooting	0.03		
Sport Hunting			5.00 – 15.00
TOTAL	0.66		6.75 – 18.50

Source: Tack (1996 In: Barrow, et al., 2000). Reproduced with permission of IIED, www.iied.org.

Similarly, Child (1995) found that the gross value of wildlife on game ranches in Zimbabwe where hunting takes place was US\$ 10.70-11.83/ha/yr compared to US\$ 4.24/ha/yr for cattle, while the net value was US\$ 3.53-4.48/ha/yr for wildlife and a negative US\$ -1.42/ha/yr for cattle on game ranches (see chapter 5, Section 5.12.7, Attaining Food Security through More Appropriate Land Use Options - Wildlife as a Land Use Option on Marginal Lands).

11.11.9.6 Kenyan conservation at a crossroads

Joel Ole Nyika, a Maasai from one of the group ranches (*Elang'ata Wuas*) near Amboseli National Park and a 2001 graduate in nature conservation from Tshwane University of Technology in South Africa, obtained a USAID consultancy to collect and collate views from communal and private landowners, which could be incorporated into the national wildlife policy. In this process, he helped in the formation of the Kenya Wildlife Working Group (KWWG). They had hoped to form a National Wildlife Forum of landowners, but were prevented through lobbying by the animal rights movement. His idea is that the kind of organizational structure needed to drive wildlife conservation on private lands is registered landowner wildlife forums at the local level (e.g., Laikipia, Machakos,

Narok, Samburu, Taita-Taveta and Kajiado). These regional wildlife forums would come together under an unregistered umbrella body, pooling their resources to lobby for policy change and to market their wildlife. His approach is that this can be done without registering the umbrella body to avoid over-regulation by government and the creation of a top-heavy NGO that is donor-dependent, as opposed to a policy-market oriented coordinating body controlled by the membership of the regional forums. His observation is that this umbrella body should be designed along the lines of the previous Kenya Pastoralist Forum (KPF), which was very effective in influencing government's pastoral policies (Nyika, 2003a.).

Nyika (2003a) compares the success of a decentralized structure to terrorist cells, while not advocating their tactics:

"Now you can reflect at what has been the success of similar decentralized bodies be it poachers networks, the mafia or terrorist groups. The only way to beat or destroy them is 1) Infiltrate them, 2) Go for the networks and destroy them - jailing them if they are the mafia, or a political movement, 3) Freeze their financial operations or assets, and 4) Legalize them as a means of regulating them".

In the case of Kenya, history demonstrates that banning wildlife use and fighting the poachers in the long-term, is doomed to failure. Legalization of wildlife utilization to the landowner is the only sure way to get a buy-in from the citizens and enforce law and order based on laws that are in the interest of the people. Currently the rule of law is forcing landowners to move outside the law in order to benefit from wildlife and/or to eliminate it in favor of other land uses.

Consistent with this, while the large landowners, mostly elites, have attempted unsuccessfully to use the law to open up the use of wildlife, the Maasai use another more effective tactic. As Nyika (2003a) puts it,

“the common Maasai way is different and more effective. If they have a disagreement with the government over revenues, they will spear one elephant or lion and increase the number if the government does not listen. Wildlife is the prime asset. Since the local communities are removed from an area to create a national park and the parks revenues are not shared with them, they kill the wildlife, make the park uneconomical and insecure for tourists, therefore pushing the government out of the tourism business, as a means of hopefully getting back their land; a logic sequence”.

Many people would call this “revenge killing” from the perspective of a Westerner or other outsiders, but to local people this is a just and appropriate reaction to an unjust imposition of inappropriate conservation policies.

When the Maasai were ejected out of Amboseli (see Chapter 5, Section 5.7.1.3, Improperly planned land tenure and impacts on wildlife and conflicts between pastoralists and small farmers, Amboseli and Maasai Mara, Kenya), from the late 1950s until 1977, the rhino population dropped from 150 to 15, many found dead from Maasai spear wounds with the horns still in place. The Maasai were making a point (Rosenblum & William, 1987). Similarly, 75% of the lions in Nairobi National Park were speared in 2003 (see Chapter 10, Section 10.8, THERE’S AN AFRICAN LION JUST AROUND THE CORNER). It would be regrettable in the enlightened 21st century if they still have to make a point.

Unfortunately, such a grassroots movement/response by rural tribal people may well be required to push the government to reopen hunting so landowners can maximize benefits from wildlife on their property, “more so than some old white guys who outsmart each other to please any wildlife director who comes along” (Nyika, 2003a). While this may seem cruel and inhumane by Western standards, at this point in time in Sub-Saharan Africa’s development, the African way may bring about quicker results than diplomacy with non-representative governments,

especially when the “diplomats” at KWS appear to be in the fold of the animal rights groups and Western donors, who prefer welfare over private sector resource driven development. Until the ear of government listens to its citizens instead of those who control the purse strings, it is likely that such reactions by the rural communities will be more common than not.

The NGO which purported to help, but which in actual fact swallowed the KWWG (Kenya Wildlife Working Group), is the East Africa Wildlife Society (EAWLS) that is receiving funds through the Conservation Of Resources Through Enterprise (CORE, sequel to COBRA⁴⁴⁹) program from USAID. EAWLS tends to be more “green” (protectionist) than pro-sustainable use. Ali Kaka, the CEO of EAWLS, is a long time friend of Richard Leakey. Kaka is the person who led a campaign to make sure that the landowners’ national agency (National Wildlife Forum) would not be called “national wildlife forum”, but a mere wildlife working group under EAWLS - so that he could either kill it or make it irrelevant (Nyika, 2003a). Ultimately, the KWWG never became a national wildlife form, but just one of the many working groups [e.g., The Kenya Wildlife Coalition Group (KWCG) and the Kenya Forest Working Group] all housed in EAWLS. The KWCG is a coalition of animal rights preservationist groups made up of ten “green groups” with IFAW⁴⁵⁰ and the Born Free Foundation⁴⁵¹ being the most active (Powys, 2003). Norton-Griffiths (2007) also mentions active involvement in Kenya by the anti-hunting animal rights NGO, the Humane Society of the United States (HSUS)⁴⁵². Marginalization of a potentially effective landowner NGO in Kenya, supporting sustainable use by subsuming it under a larger body

controlled by animal rights groups, has been a common tactic to compromise their effectiveness and stymie the development of such movements (Nyika, *pers. comm.*).⁴⁵³

Sustainable use groups and animal rights groups are philosophically on the opposite ends of the spectrum. The current situation is akin to housing a church and a house of ill repute under the same roof. The weak will be absorbed by the strong; in the case of Kenya, the KWWG risks to be absorbed or neutered by the well financed KWCG animal rights coalition.

“The head of community wildlife service with instructions from the Director of KWS wrote a one sentence email letter to the USAID–CORE program director that he had instructed ALL his staff not to deal with Joel Ole Nyika in anyway - Reason nil. The only logical reason we can think of is that when the director Michael Wamiithi was appointed to head KWS from IFAW, I was on record saying his appointment is not healthy to country conservation efforts due his background as an extreme and radical lobbyist.

When the minister of wildlife called us to his office to seek our stand on bushmeat, we discovered that the director had already wrongly advised him to ban all game cropping exercises - as he alleged that this is the main cause of the (illegal)⁴⁵⁴ bushmeat trade. I strongly opposed that in front of the minister, permanent secretary-in-charge of ministry and the director. The minister backed us and asked us to write a petition paper to him on that, which we did. Two weeks later I was on BBC radio interviewed by Julian Pettifer on community position on wildlife conservation in Kenya, on which I said that local people would continue to remain poor unless they are allowed to utilize their wildlife especially through recreational (overseas trophy hunting) hunting. That the forces against hunting in Kenya are more of myth than real.

⁴⁵³ Email of November 17, 2003 from Nyika to DeGeorges, nyikajoel@hotmail.com

⁴⁵⁴ Formalized game cropping is part of the legal bushmeat trade.

The director was left with no option but to network with his animal right friends including USAID guys to 'isolate' me, but it was too late my - position is now the official position - even at higher levels - that there is need for 'a new responsible leadership in KWS' one that is not driven by international animal right NGO(s) and personality bigotry. Leakey came out of his cave and started his usual 'I -will- ask- the- whole- world- to -stop -funding- Kenya' if the minister will not stop interfering with the running of KWS...our friends outside Kenya should join us in putting more pressure to the Government to clear up the mess and restore integrity to our wildlife estates" (Nyika, 2003b).

Nyika (2003b) goes on to say, "bring economics (hunting) not Aid, Science not irrational emotions about suspending aid. Talk to your leaders in congress to urge USAID to abolish animal right positions and sponsorship".

In 2003 the Minister of Tourism sacked the entire Board of Trustees, Chairman Njonjo and Vice Chairman Richard Leakey (Powys, 2003), and has distanced itself from the endowment fund being pushed by Leakey in Kenya and Robby Robinson [former head of South African National Parks (SANparks)] in Uganda, both allied with the animal rights movement. This trust fund, similar to the bail out of Kenya with money after the ivory burn, would allow the Kenya Wildlife Service (KWS) and Uganda Wildlife Authority (UWA) to live off the interest of the trust, as opposed to living off their wildlife/natural resources. This would be a disincentive to valorize these resources, both for the government and the local communities, and would result in a continued and accelerated conversion of habitat to farms and over-grazed pasture. Everybody and everything that is associated with Leakey is being removed (Nyika, 2003c)

Certainly, there is concern that this endowment fund and continual propping up of KWS by the Western donors is a disincentive to stand on their own two feet, maximizing profits from wildlife resources through both ecotourism and safari hunting. As currently managed,

"the net agricultural opportunity cost of alternative land uses and earnings foregone to the Kenyan economy from maintaining nearly 61,000 km² of land under protected areas is \$US 203 million, some 2.8% of GDP and equivalent to support to 4.2 million Kenyans. The combined net returns from wildlife and forestry of \$US 42 million is inadequate to offset these costs, at the national or household level" (Norton-Griffiths & Southey, 1995 *In: Emerton, 1998*).

With no incentive for the landowner to conserve wildlife and its habitat - private, cooperative and group ranches where 80% of Kenya's wildlife are found - are rapidly going under the plow, often in areas marginal for agriculture (see Chapters three and Chapter 5, Section 5.7.1.3, Improperly planned land tenure and impacts on wildlife and conflicts between pastoralists and small farmers, Amboseli and Maasai Mara, Kenya) to the detriment of the people and wildlife. This has to be one of the best examples world-wide of how foreign aid is a disincentive for good conservation by local people, while propping up dysfunctional government wildlife bodies and allowing animal rights groups [e.g., in Kenya, International Fund for Animal Welfare (IFAW) and the Born Free Foundation], who have already infiltrated Western donor agencies to infiltrate and impose Western urban values on a people who must still be allowed to live directly off their resources if they and their natural resources are to have a future.

Unless the wildlife coming out of these protected areas onto group ranches, along with resident game, can generate significant income for peripheral residents, not only does the carrying capacity of these protected areas risk to be significantly reduced, but Kenya's parks and protected areas will have a difficult time justifying their existence to a land hungry public. Innovative solutions such as natural areas being managed as "living factories", deriving as much economic revenue out of them as possible from all available resources through sustainable use and non-consumptive use, sharing this wealth with local communities, maybe even building community run enterprises that provide direct employment to

individuals from the community. Kenya must also strongly consider allowing the free-market on private lands, as in southern Africa, to determine how wildlife can be used as an economic resource. If Kenya's wildlife is mainly for expatriate "elites" such as tourists, researchers and NGOs, ultimately this wildlife and its habitat will be lost as a local, national and international heritage in favor of other land uses. There are just too many people and too much poverty. Also, by maximizing economic returns on wildlife from parks and protected areas, Kenya Wildlife Service (KWS) may ultimately break its bondage of living off international welfare from the donors and NGOs with concomitant obligations to adopt Western value systems, as opposed to African values when it comes to wildlife and conservation.

As Ole Nyika has said, we don't want donor handouts; we want to live off of our resources, including wildlife (Nyika, 2003b). The ideological battle goes on, as the Western animal rights groups appear to currently dominate Kenya and Uganda's eco-politics.

The Kenya Wildlife (Management and Conservation) Bill, developed by landowners in collaboration with members of parliament, passed the Kenyan Parliament in 2004, but was rejected by the Office of the President, based on one phrase in the bill which would have automatically lifted the 1977 presidential hunting ban. In essence, this bill would have returned wildlife to the landowners, allowing free-market forces to drive conservation on private lands in Kenya. Speculation has it that the animal rights paid people off to have this bill squashed.

The ideological battle continued into 2007, when the Draft Wildlife Policy of April 17th 2007 that would have permitted sustainable use and wildlife conservation as a land use was sidelined as the National Steering Committee turned to a single IFAW consultant to produce a final "Wildlife (Conservation and

Management) Bill, 2007" (dated May 10th). This bill undermines the Draft Wildlife Policy banning outright sport hunting, bird shooting and game fishing. IFAW cares little for the impacts on wildlife or rural poverty as long as consumptive use, especially hunting, is not reintroduced to Kenya. The underlying purpose is fundraising in America based upon its "Kenyan success story". Meanwhile, with offices in Nairobi, Western NGO groups such as WWF and AWF, as well as the IUCN that supposedly support sustainable use failed to react, fearing that they would be labeled as supporting "killing for fun" (Norton-Griffiths, 2007). What's new, as this might adversely impact their Western based fundraising efforts that sustain them, putting them in the same boat as the animal rights groups!

It is a known fact that Patricia Awori, daughter of Vice President Moody Awori, is head of the Kenya Wildlife Coalition Group (KWCG) (Croze, Sayialel & Sitnonik, 2006) that includes the IFAW and Born Free Foundation. The battle of Kenyans to control their wildlife from dominance by outside forces goes on. What is at stake is the habitat that houses more than 80% of Kenya's mega-fauna, private land, often - as with Maasai Mara - serving as rainy season dispersal and nursery areas. Let us hope that the rural landholders of Kenya finally get ownership of their wildlife back.

As Parker (2004) puts it, he is not sure if Western involvement in Sub-Saharan Africa's affairs is for the better, concerned that it may impede the evolution of the subcontinent evolving its own system of order out of chaos brought about by the abrupt change from colonialism to independence. Conservation policy is laid down by white people from America and Europe, coming across as crudely arrogant when animal loving organizations from the United States threaten Kenya with an anti-American tourist campaign if hunting is reopened (Parker, 2004).

11.11.10 Ranamafona Lemur Reserve, Madagascar

When interviewed the spokesman of the community explained,

“We realize that our forests are disappearing from unsustainable slash and burn agriculture, but we are torn between feeding our children today and having forests tomorrow. We were one of the last groups to resist the French. We are willing to collaborate with you, but anyone who tries to cut us off from feeding our families should be prepared for war” (DeGeorges, 1990b; DeGeorges, 1992a).

When the head of the USAID funded project, lemur researcher Patricia Wright was asked what development is, she responded,

“Development is taking USAID’s money and building school, roads and clinics in return for the people not cutting down the forest” (Wright, *pers. comm.*).

When she was asked what she would do when USAID’s project ended and there was no money to repair roads or buy medical supplies, notebooks and pencils, there was no response.

Due to international conservation politics, especially pressure from American conservationists not necessarily the desires of the local people, this area has been declared a park. About 72,000 people live in villages surrounding the park. Many of them cut wood in the park and graze cattle in the park, among other resources that are extracted. Now they cannot legally enter the park (Bonner, 1993). Time will tell whether the future will be collegial or confrontational,

whether they will be integrated into the management of the park or, as we have seen in so many Western funded programs, cut out of the park.

11.11.11 Andohahela Lemur Reserve, Madagascar

While a group of young girls sang for a USAID/government evaluation team a beautiful song which the project formal environmental education program taught them “Don't touch the forest, plant trees on the farm”, a simultaneous interview with another group of school children demonstrated that through non-formal education their parents were teaching them how to live in a harsh and unforgiving environment using the vegetation of the forest for food, medicine, shelter material and handicrafts, the children able to give local names for each key species. One young girl asked, “We're confused, why don't you want us to hunt and gather in the forest”! When a group of adults were asked how they viewed forests, their reaction was, “Forests are banks of farmland” waiting to be cultivated (DeGeorges, 1992a; 1992b).

Are we not prejudging, based on a Western urban bias by people who purchase their food in a grocery store, what is best for these communities and what it means for the long-term success of such a project? (see Section 11.11.8, Dzanga-Sangha and Empire Building, Central African Republic). Fairhead and Leach (2003) describe how mass media and environmental education in developing countries have tended to promote colonial and post-colonial state agendas, reinforcing culturally-imperial northern agendas. Today, NGOs and donor agencies are producing media and educational materials linked to Western research and policy values, often in conflict with traditional values and management systems in rural Sub-Saharan Africa. In some cases, where fallow periods are disappearing, they

may make sense, but in many cases preservation biases of international and urban-based elites, once removed from nature, placing their preservationist values on rural resource dependent people, will not be accepted (see Section 11.11.8, Dzanga-Sangha and Empire Building, Central African Republic).

Attempts were made to improve paddy rice culture around many of the national parks, yet rice cannot compare in nutrition to many of the crops, which people grow on the hillsides, in yield/hectare in energy and in protein (DeGeorges, 1993) (Table 11.26):

Table 11.26: Nutritional value, hillside versus paddy crops, Madagascar

CROP	ENERGY kcal/ha x 10 ^{6th}	CARBOHYDRATE g/100 g	PROTEIN g/100 g	PROTEIN kg/ha
HILLSIDE				
Manioc	8.2	38.06	1.36	37
Yam	5.7	27.88	1.53	107
Sweet Potato	7.4	17.61	1.57	96
Maize	3.2	79.60	8.80	82
PADDY				
Rice	3.2	79.34	6.61	72

Note: USDA (2004) data for carbohydrate and protein g/100g, U.S. Department of Agriculture, Food and Nutrition Information Center, www.nal.usda.gov/fnic.

Extracted from: DeGeorges (1993)

Improved fallow agriculture and other appropriate technologies must be considered to improve yields and soil conservation in rainfed areas (see Chapter 5, Section 5.12.1, Technological Solutions to Africa Food Crisis and Land Degradation). Rice is not the “save all”, even if it is an important part of the Malagasy diet. Similarly, nutrition was worse under a rice dominated diet, compared to the diverse array of resources obtained on the Senegal River's floodplains before the construction of dams (see Chapter 7, Section 7.10.8.1, Senegal River).

Speaking of diverse portfolios from the natural resource base, great potential exists to preserve the forests by helping local communities market resources from the forests for the aquarium trade. The exploitation of these minor forest resources is the responsibility of the *Direction des Eaux et Forêts* (DEF). Madagascar is a signatory to the Convention for the Trade in Endangered Species (CITES), which regulates trade in endangered species. Trade in wildlife and plants from Madagascar generates substantial income, which, unfortunately, remains in the hands of only a few major operators, many expatriate. These middlemen make the majority of the profits, no different from safari and tour operators in Sub-Saharan Africa.

As in trophy hunting in Sub-Saharan Africa, if local communities at the household level perceive substantial benefits from these products, they may be convinced to conserve Madagascar's remaining forests. Animals are generally collected by local villages, often children, and sold to agents acting on behalf of the operator (exporter). The price structure varies considerably from the collector through the middleman, to the exporter and final retailer. When compared to the overseas retail prices, it is clear that the percentage return to the local population collecting the specimens is in need of review. For instance, a *Mantella* spp. frog on average is worth FMg (*Franc Malagasy*) 75-200 = maximum of US\$ 0.42/frog, and for chameleon FMg 250-1,000 = maximum US\$ 0.56/chameleon paid by the collector to the rural community. They retail overseas for as much as US\$ 60 for a frog and up to US\$ 220 for a chameleon (BIODEV Consultants, 1993 *In: Development Assistance Corporation, 1993*).

In addition, from 1979-1988, 8,433.9 tons of medicinal plants were exported bringing close to US\$ 900,000 to Madagascar. There were nine exporters, two exporting *Centella asiatica* and seven who export *Catharanthus roseus*. *Centella asiatica* is a cicatrisant aiding in healing of wounds (Rakotobe, Razafindrabeaza,

Randrianasolo & Andriantsiferana, 1988 *In:* DeGeorges, 1993). *Catharanthus roseus*, “Rosy Periwinkle”, is used in cancer treatment. A problem, as with most products from Sub-Saharan Africa marketed raw, is the producer receives only a very small percentage of the value of the end product (Tables 11.27 and 11.28). As discussed in Chapter nine (Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders), there is a crying need for rural communities to develop overseas direct market links, cutting out the middleman, if they ever hope to receive a reasonable percentage of the value from these rural resources.

Table 11.27: Value of key medicinal plant, *Centella asiatica*, to peasant, middleman and end users

<i>Centella asiatica</i>	Price/Kg
To peasant	50 FMG fresh, 100 FMG dry = US\$ 0.06
Local Market	1000 FMG = US\$ 0.56
Price FOB	3,000 FMG = US\$ 1.67
Price of Extract in Medicine	15,088,044 FMG = US\$ 8,382
Price of Extract in Powder	20,839,000 FMG = US\$ 11,577

Source: Rakotobe, Razafindrabeaza, Randrianasolo and Andriantsiferana (1988 *In:* DeGeorges, 1993)

Table 11.28: Value of key medicinal plant, rosy periwinkle, *Catharanthus roseus*, to peasant, middleman and end users

<i>Catharanthus roseus</i>	Price/Kg
To peasant	300 FMG = US\$ 0.17
Local Market	500 FMG = US\$ 0.28
FOB	840.55 FMG = US\$ 0.47
Extract in Medicine as Powder	1,627,070,000 FMG = US\$ 903,928

Source: Rakotobe, Razafindrabeaza, Randrianasolo and Andriantsiferana (1988 *In:* DeGeorges, 1993)

Other key medicinal plants include *Pygeum africanum* whose bark is sent to Europe for treatment of prostate problems, *Rauvolfia confertiflora* whose bark is sent to Europe for treatment of low blood pressure, and *Voacanga thouarsii* marketed in Europe and used as an oxygenator, cerebral irrigator and as a

vasodilator. With the correct pricing structure, potential exists to significantly improve the livelihoods of local people in Madagascar, by living from the forests instead of eliminating them (DeGeorges, 1993). One can only hope this is where the world's conservation community wants to go. Olivier Behra (*pers. comm.*) of BIODEV, a local NGO, believed that helping the rural Malagasy market and receive added value for the riches of their forests was the only way in the long-term to save the forests, making them more valuable than farmland. This argument holds true across Sub-Saharan Africa for its natural systems.

11.12 TRADE NOT AID

In the long run, government-to-government foreign aid cannot bring about development. Foreign aid and policies must go into encouraging Foreign Direct Investment (FDI) and trade (see Chapter 13, Section 13.13, TRADE NOT AID).

11.13 AREAS WHERE FOREIGN AID CAN MAKE A DIFFERENCE – EDUCATION AND HEALTH

Few link health and education to conservation. In fact, many argue that improved health is linked to population increases in Sub-Saharan Africa, further degrading habitat. The authors argue that in fact improved health and education are the only hope for the survival of wildlife by offering insight, hope and most importantly, alternative lifestyles for rural populations looking to escape the over-crowded rural areas that can no longer sustain them. David Western, former director of the Kenya Wildlife Service (KWS) and long-term researcher of human conservation issues around Amboseli National Park, bests sums up his evolution in thinking over this issue:

“I began hunting as a kid. I was driven by a passion so deep that nothing else mattered, only the kill. Books and music held no

interest. I was hell-bent on becoming a great hunter, in the mold of George Rushby and others I met in southern Tanzania. Life was as cut-and-dried as firewood, all raw emotions with no thought of animal suffering. I didn't understand or care for wildlife laws either, except inasmuch as they granted hunters like my father license to kill a couple of elephants and rhinos a year, and antelope for the pot. We got on well with traditional African hunters—they directed us to elephants and we left them meat in return. Ivory poachers were another matter. They slaughtered elephants and robbed licensed hunters like us of big tuskers. I was far too callow to see the contradiction: they were following customary rights granted by God for their survival. We were interlopers, stealing their animals for our gratification...My father was deeply troubled by looming independence, the spread of meat poaching, and the thinning herds. The only hope he saw was to set aside National Parks and evict people. Before long, I was caught up in his fervor for protecting animals and fighting poachers. I swore to become a game warden...Wildlife had become a rallying point against colonialism that had denied Africans the rights to hunt. To the villager, the poacher was no thief. He saved the farmer's crops from elephants and gave him meat. I was still for parks, but saw the wrong being done to people in the name of what was right for animals. To my passion for animals was added a social conscience about human suffering too...The answers for now lay not in science or a passion for wildlife, but in securing the rights, opportunities, and skills that local communities needed for their development. This was the only hope of stemming population growth, diminishing pasture, poor health, and lack of education. Without addressing these problems, pastoralists living in prime wildlife areas were trapped in poverty and ill-prepared for alternative livelihoods elsewhere. If there was no hope for pastoralists, there certainly wasn't for wildlife" (Western, 2005 In: Lyman & Child, 2005).

To date, "by and large, relations between donors and governments still place much more emphasis on transfers of finance and technical assistance than on development and use of African institutional and human capacity" (Lele, 1990 In: Eicher & Staatz, 1990).

This may be slowly changing. In the World Bank funded Partner for Improvement of Management of Natural Ecosystems /*Projet de Partenariat Pour la Amelioration de la Gestion des Ecosystems Naturels* (PAGEN) in Burkina

Faso, only national expertise is employed and money exists for tertiary education, though it is currently being used to educate bureaucrats rather than youth from rural communities being empowered to manage wildlife (Pavy, *pers. comm.*) (see Chapter 9, Section 9.8.9.1, Management of Comé-Leraba Game Reserve, Southern Burkina Faso and 9.8.9.3, Community based natural forest management, *Gestion des Terroirs*, Burkina Faso).

Currently, more than 250 million Sub-Saharan Africans lack access to safe water, more than 200 million have no access to health services, nutrition is not improving, more than two million children a year die before their first birthday, more than 140 million youth are illiterate and less than 25% of poor, rural females attend primary school (World Bank, 2000).

Education and health (e.g., HIV/AIDS and potable water supplies) are two priority areas where an increase in aid is desperately needed and could make an enormous difference to the lives of millions of people in Sub-Saharan Africa and to conservation by the people. Sub-Saharan Africa's education crisis is stunting its development. Education has the potential to be a "stealth weapon" in the war against poverty. It can open doors to better health, increased income and independence. For the cost of just one of the Cruise missiles fired on Baghdad, around 100 schools could be built in Sub-Saharan Africa. The total amount of Western aid needed each year to put every child in the world into school is \$5.6 billion – a fraction of what was spent on the war against Iraq and equivalent to around three days' global military spending (Palmer & Kline, 2003). Between September 2001 and January 31, 2007, the war in Iraq, Afghanistan and other operations in the war on terrorism cost the U.S. Government US\$ 503 billion or about US\$ 1.9 billion/week (CBO, 2007). Investment in education and health will result in a decline in birth rates and HIV/AIDS. It will produce productive adults able to fit into a global economy as envisioned by the New Partnership for Africa's Development (NEPAD). It will help bring about democracy as a result

of awareness through education, the greater society demanding accountability from their leaders. Finally, it will produce people capable of finding “African Solutions to African Problems” that fit within the socio-cultural context of their societies, helping Africa catch up in development with the rest of the World. The only other real need is food relief, until middleclass societies can be created capable of commercially producing and purchasing their own food. Minor areas might include conservation and research in sustainable agricultural production – but much of this will happen on its own with an educated society.

If not squandered, the June 2005 cancellation of US\$ 40 billion in debt by the G-8 countries, impacting 18 of the poorest countries, 14 in Sub-Saharan Africa, could contribute in a small way in achieving Millennium 2000 goals of universal education and health care (McLaughin, 2005) (see Section 11.13.2, Health in Sub-Saharan Africa at the Beginning of the New Millennium; Chapter 12, Section 12.5, DEBT AND STRUCTURAL ADJUSTMENT POLICIES and Chapter 13, Section 13.12.3, Role of private sector versus foreign aid in economic development). In order to assure the best use of such money, Sachs (2005) believes in “aid harmonization” in which donors pool their money into common programs.

11.13.1 Education

Lester Brown (2003) of the Earth Policy Institute states, “It is difficult to have a functioning democracy with a largely illiterate population. Without literacy and a modicum of education, societies are often governed by superstition, making rational democracy difficult. For those who are illiterate, educational horizons and job opportunities are limited”.

“Environmentally responsible behavior also depends to a great extent on a capacity to understand basic scientific issues, such as the greenhouse effect or the ecological role of forests. Lacking this, it is harder to grasp the link between fossil fuel burning and

climate change or between tree cutting and the incidence of flooding or the loss of biological diversity. The deteriorating relationship between the global economy and the earth's ecosystem requires an all out effort to bring literacy to all adults in order to break the poverty cycle and to stabilize population.

Those who never attend school are also often outside the loop in acquiring basic information on nutrition and hygiene. They may have little exposure to HIV education and no understanding of how the disease is spread. Since vaccinations are often administered through schools, those who do not attend classes may not receive these basic shots. If schools provide free lunches, those who are not there will also miss out nutritionally. For the poorer segments of society, this is not a trivial deprivation.

For those worldwide, some 60% of illiterate adults are female. Where there is illiteracy, there is poverty. They tend to reinforce each other simply because illiterate women have much larger families than literate women do and because each year of schooling raises earning power by 10–20%. Illiterate women are trapped by large families and minimal earning power" (Brown, 2003).

Leistner (2004) notes that because the majority of people are uneducated in the Western sense, the political elite are the only ones in a given country who can relate to the outside Western world, in essence cutting off the masses from expressing their concerns and aspirations.

"A chasm exists between those whose mastery of a European language gives them access to the modern world's wealth of knowledge and opportunities",

this becoming even more important with the development of the information age and the internet. Education will be the equalizing force.

"One way of narrowing the gap between rich and poor is universal education. Under the World Bank's 'Education for All' program, any country with a well-designed plan to achieve universal primary education should receive financial support. The three principal requirements are that a country submits a sensible plan to reach universal basic education, commit a meaningful share of its own

resources to the plan, and have transparent budgeting and accounting practices. Monitoring 10 fast-track countries, singled out because they quickly submit solid plans for achieving the ‘Education for All’ goals, could provide useful information on what works and what does not work in various social situations. No child would be deprived of education because his or her parents cannot afford books and school fees.

The World Bank estimates that external funding of \$2.5–5 billion a year would be needed if the 47 poorest countries are to achieve universal primary education by 2015 (see Chapter 13, Section 13.12.3, Role of private sector versus foreign aid in economic development). Doing this in the 88 countries that are unlikely to reach universal primary education by 2015 would cost perhaps three times as much. Even if it were to cost \$15 billion per year, it would still be a bargain. At a time when personal computers give many schoolchildren access not only to books but also to the vast information resources of the Internet, having other children who never go to school is no longer acceptable” (Brown, 2003).

Guest (2004) argues that Sub-Saharan Africa must place an emphasis on improving standards of primary and secondary education before worrying about the quality of tertiary education, otherwise only the children of elite will be able to compete in universities. This is the case with South Africa, scoring last in the world out of 40 countries in basic literacy, with 80% of the primary schools failing to reach a benchmark that averages 6% globally, and last in the world out of 46 participating countries in math and science (Blaine, 2007). Yet if this testing separated out test scores of children from middle- and upper-class suburban schools from township/rural schools – no longer racial, but a socio-economic issue, South Africa would likely test in the top 10.

11.13.1.1 Educational situation in Sub-Saharan Africa at the beginning of the new millennium

The absolute number of illiterates in Sub-Saharan Africa was expected to increase from 132 million in 1980 to 147 million by 2000 (Alemayehu, 2000).

“Universal primary education is one of the Millennium Development Goals that is furthest away from attainment...When children remain sufficiently long in school, and in particular when girls receive adequate schooling, this increases economic growth rates, lowers fertility rates, leads to a reduction in child mortality and improves the educational attainments of the next generation. Adequate primary and secondary education is more than the empowerment of the individual, it is the empowerment of the society” (ILO, 2004).

Similarly, Sachs (2005) concludes fertility rates will decrease with increased education of girls and lower child mortality linked to improved economic conditions. Yet in Sub-Saharan Africa, fewer than six of ten primary-school aged children were enrolled in 2000, the lowest rate of any region and far below the 84% world average (see Chapter 12, Section, 12.6.2, Education and Structural Adjustment).

“Overall primary enrolment in Sub-Saharan Africa increased from 62 million in 1990 to 92 million in 2001; with the growth in the school age population over this period, the impact on net enrolment rates has been less dramatic, from 55% to 63%” (Commission for Africa, 2005).

It is estimated in Sub-Saharan Africa US\$ 6-8 billion/year is needed to assure universal primary education (Commission for Africa, 2005), about 1 months spending by the U.S. on the war in Iraq, Afghanistan and other operations in the war on terrorism (CBO, 2007). Therefore, although contributing, it is unlikely that the once off US\$ debt relief of June 2005 on its own will assure the attainment of SSA’s educational and health goals (see Section 12.5.2, 2005 Debt Cancellation).

Some 44 million children are out of school in Sub-Saharan Africa. School-based surveys for many countries show that household and domestic work and the family farm are major reasons for not attending, more so for girls than for boys.

Half of Sub-Saharan African countries show gross enrolment rates of no more than 26% for secondary education and 2.5% for higher education of school aged youth (World Economic Forum, 2004).

“Gender disparities and inequalities are wide: 11 (Sub-Saharan African) countries have gender parity indices of less than 0.76 (1 = parity) in primary school—Benin, Burkina Faso, the Central African Republic, Chad, Côte d’Ivoire, Ethiopia, Guinea-Conakry, Guinea-Bissau, Liberia, Mali and Mozambique. Gender issues are still treated as marginal in some of the poorer states where discrimination against schooling girls remains strong. Without sustained policy changes and resource commitments, it is highly unlikely that these countries will achieve gender parity and universal primary enrolment by 2015” (World Economic Forum, 2004) (see Chapter 13, Section 13.12.3, Role of private sector versus foreign aid in economic development).

“Half (50%) the SSA countries with data were spending less than 3.4% of national income on education in 2000—lower than the 4.1% average for developing countries. None of this is easy. The total costs to government continue to rise” (World Economic Forum, 2004).

“Several countries have enacted legislation for introducing or strengthening the provision of free and compulsory education, including Guinea-Conakry, Madagascar, Niger, Nigeria Uganda, Kenya and Zambia. South Africa’s constitution, adopted in final form in 1996, specifies 9 years of compulsory schooling making education for black South Africans compulsory for the first time...Primary school fees are still charged in 14 Sub-Saharan African countries unlikely to achieve gender parity in primary schooling in 2005 or even in 2015. Removing them would probably be the single most effective means of raising primary enrolments and reducing gender disparities in the short term” (World Economic Forum, 2004).

“Corporate support to education is still young, mostly from the oil community, not all of it voluntary...Africa receives the highest proportion of bilateral education aid of any region (approximately 27%), and more than the global average of education aid per capita, per school age child and per illiterate person. But it receives

less than the global average of aid per child out of school" (World Economic Forum, 2004).

"The 'Fast-Track Initiative' designed primarily by the World Bank is the world's new effort to match donor resources to effective national policies. Of the 18 countries accepted so far, 10 are from Sub-Saharan Africa—Burkina Faso, Ethiopia, Gambia, Ghana, Guinea-Conakry, Mozambique, Niger, Tanzania, Uganda and Zambia. The reduction of teacher salaries to improve affordability is possibly the most controversial issue in many African countries, jeopardizing efforts to improve education systems" (World Economic Forum, 2004).

"Countries with a Poverty Reduction Strategy Papers (PRSPs) – see Chapter 12, Section 12.5.1, The HIPC initiative - Half-hearted, Inadequate, Piecemeal Cancellation "Debt Relief") and an agreed 'credible' education sector plan are eligible to develop proposals to join the Fast-Track Initiative...so far, the 'Fast-Track Initiative' has not generated enough resources to close the expected financial gaps in the 10 African countries over the next few years. After raising high expectations that significant new funding would be mobilized for achieving the goal, has yet to receive substantial and specific international support for its activities" (World Economic Forum, 2004).

"Unless more funding is secured quickly, this instrument to help secure 'Education for All' is likely to be at risk. There is also a danger in thinking of the initiative as only a funding mechanism. It needs to be integrated with national reform processes and to help tackle fundamental structural issues of institutional development and reform in education" (World Economic Forum, 2004).

11.13.1.2 What kind of education?

As far back as the 1960s, French agronomist, and then Director of Research at the Institute national Agronomique in Paris, René Dumont (1966), was concerned about the appropriateness of the European model of "abstract education" in Africa. He believed that "schools should not detach the young schoolboy from his original rural world but train him so that he is in a position to modernize it".

He saw the villages and towns filling up with “educated”, but jobless and idle youth. He was worried that they would end up in shantytowns of the capitals as social parasites.

Unfortunately, in 2003, this is more the case than not, the “*bidonvilles*” or slums of Sub-Saharan Africa’s big cities being filled with disaffected youth flocking out of the rural areas to the bright lights of the big cities, seeing no future in the over-crowded ecologically degraded rural areas. When the principal author was an advisor to the Gambia River Basin Development Organization (OMVG) in the 1980s in Dakar, Senegal, he kept his apartment opened to Peace Corps Volunteers living in isolated rural villages. He was visited by many volunteers based in rural Gambia. One key observation they all made is that the education afforded rural Africans, while fine for someone living in London, basic reading, writing and arithmetic - in no way taught these youth how to better live with their environment, improving their lives through adopting modern agricultural, soil conservation, range management and animal husbandry technologies. Ironically, even today, most African Anglophone countries rely on the standardized Oxford Exam to determine if their youth are prepared to go out into the “real world”. René Dumont (1966) explained that it is sheer stupidity to insist that a rice cultivator’s child in Betsileo (Madagascar) be educated in the same way as a worker’s child in Paris. “It was already a grave error to be teaching the French peasant in Lozere and the metallurgist in Lorraine absolute uniformly”. As the Peace Corps Volunteers explained,

“when these kids finish school, they look around and say, ‘there is nothing for me out here so I am heading for the capital of Banjul.’”

Without a vibrant private sector or industry, what awaits these youth is unemployment, drugs, crime and prostitution. What then is this appropriate education and is this what we are training Africa’s youth for? What else is

needed if modern education is to be of any value? Is it not foreign investment in industry and technology to absorb these youth, both those who choose to remain in the rural areas farming, as well as those who will work in industries that transform the products they will produce?

Africa is in a dilemma of over-populated and increasingly degraded rural areas and growing urban slums (see Chapter 5, Section 5.7.5, Food Security and Urbanization in Sub-Saharan Africa). What is the solution?

This book certainly does not have all the answers, but it will put forth ideas. Appropriate education is a key to finding the way forward, along with industrialization. Thus, appropriate education needs to train youth in rural areas to better and more intensively manage their natural systems, which are rapidly degrading through antiquated traditional extensive management systems, overwhelmed by over-population. Appropriate education needs to train youth in practical skills from accounting and marketing to electronics, surveying, engineers and information technology – skills that will prepare the bulk of Africa's youth for employment in what need to become growing urban centers of trade and industry.

Yes, reading, writing and arithmetic must be the basis of all education, regardless of one's training, but schools, as in South Africa should be more applied, teaching practical skills that can be used in managing natural resources, farming, in industry or information technology. However, standards must be maintained. Sub-Saharan Africa needs more vocational secondary schools where a child can learn about the latest agronomic and range management techniques in rural areas, or be trained in sustainable wildlife, timber and fisheries management, or in mineral exploitation and refinement – life skills that will enable them to fit into a modern

society that will more and more require the use of intensive management systems to develop rural and urban economies.

The “bright lights” from these schools can go on for advanced university training, while the high school graduates from these secondary schools should be prepared to join their father on the farm to improve agricultural production – if that is their choice, and/or to be absorbed into trade, industry and IT in the urban settings. The Commission for Africa (2005) advocates carrying this on through tertiary education, advocating, “a long-term program of investment is needed, both to revitalize African universities and to support the development of centers of excellence in science, engineering and technology, including African institutes of technology”. It is believed that South Africa’s first world tertiary training institutions have an important role to play, initially in taking the place of traditional European and American universities to provide a more relevant and cost-effective education and eventually, by partnering with institutions on the rest of the subcontinent, to raise their standards of education.

In September 2005, the Partnership for Higher Education in Africa (consisting of Carnegie Corporation of New York, as well as the Ford, MacArthur and Rockefeller Foundations and the William and Flora Hewlett and Andrew W. Mellon Foundations) pledged an additional US\$ 200 million over the US\$ 150 million already invested in 2000 to improve education in 40 universities in the seven countries of Nigeria, Ghana, Kenya, Mozambique, South Africa, Tanzania and Uganda. An investment in higher education will serve as a basis for laying the foundation for democracy and economic development (DeCapua, 2005b; Schoetzau, 2005).

Meanwhile South Africa and the rest of Sub-Saharan Africa must get their primary and secondary education up to par. Even South Africa has a major

challenge in getting its township and rural primary and secondary schools up to international standards to be able to compete in its international quality universities. However, a word of caution to South Africa - it cannot afford to turn First World universities into Third World universities by dropping standards to the level of graduates of inferior education from townships and rural areas. Not only would it be a disservice by producing university graduates whose degrees would no longer be recognized globally, it would risk creating a dysfunctional society unable to compete in the global market place.

The Commission for Africa (2005) also supports various mentoring/apprenticeship programs. For example,

“the National Open Apprenticeship Scheme (NOAS) in Nigeria attempts to link education with the workplace through practical training under master craftsmen in key industries such as docking and railways. Since its inception in 1992 over 600,000 young people have been trained in over 80 trades, 400,000 of which have started their own micro enterprises” (Commission for Africa, 2005).

The Commission also believes that entrepreneurial skills need to be part of the educational curriculum in secondary schools, since unlike the past, few graduates will have the opportunity to work for government. Such programs can link farmers, businessmen, fishermen, loggers, IT technicians and engineers to secondary and tertiary educational institutions (see Chapter 5, Section, 5.12.6.1 South Africa, an Emerging Model in Public Private Partnerships).

Part of this problem is because of Sub-Saharan Africa’s failure to develop economically, creating a demand for their skills, and part is because there are a surplus of trained youth, many who have limited practical skills – how many history majors, artists and social scientists can Africa employ? Yes it needs these

skills, as well as trained doctors and veterinarians, but it needs lots more people able to “dirty their hands”, but trained in the latest technologies to increase agricultural production and transformation (agronomists, plant scientists, soil scientists, range managers, agri-engineers), to manage Sub-Saharan Africa’s forests and wildlife (foresters, wildlife and fishery biologists), to extract and then transform its mineral wealth (geologists and engineers), to build its highways and other infrastructure (e.g., engineers, designers, architects and surveyors), to run and operate its IT centers, and to run, operate and market the businesses (e.g., MBA’s, accountants and entrepreneurs). Everyone should be exposed to the historical past so that the atrocities of history do not repeat themselves (e.g., WWI and II, the genocides of Nazi Germany, Rwanda and Darfur, segregation in the USA and Apartheid in South Africa) and the wonders of art, literature and philosophy, but the bulk of the training needs to be technical and applied in the fields of resource management and transformation, the sciences, business, engineering and geology, and agriculture/agro-industry.

As René Dumont (1966) explains

“along with its bookish emphasis totally detached from nature – itself a book one must learn to ‘read’ – French education also develops an antipathy towards manual labor...a child leaving school is contemptuous of his younger brother, still hoeing the ground”.

If that younger brother is trained in the latest agricultural and extractive mineral technologies or in sustainable timber, wildlife and fisheries management and he can earn a decent living from the sustainable use of these resources – then as in America, a plumber or electrician can make more than a white-collar worker. Not everyone in Sub-Saharan Africa wants to be a bureaucratic stuck behind a desk in some mundane boring job with limited opportunities for career advancement, where pay is so low that corruption becomes a way of survival.

Finally, in rural areas where women are the backbone of traditional food-production agriculture and men into cash crops (sometimes women move into this arena), as in rural America in the early 20th century, an equal emphasis needs to be placed on training and educating women and not just men (Dumont, 1966; Buvinic & Mehra, 1990 *In: Eicher & Staatz, 1990*).

Adult, education – yes there is likely some value in this, but the future is in Africa's youth and if education is practical, especially in the rural areas, why can't these youth serve as “agricultural extension agents” to their families and villages, where governments, given limited resources, are unable to completely fulfill this task. In less than a generation, with appropriate education, as we have in America and Europe with our vocational schools, these youth will be the adult workers already trained in appropriate technologies and not needing “adult education”. Then there is the age old adage, “you can teach an old dog new tricks” so work with the puppies.

Finally, this education must not be for just a privileged few, otherwise Sub-Saharan Africa will be back into creating an educated minority elite who risk to take advantage of a backwards majority. It must be universal and available to everyone – the majority of the populace, and of equal quality, regardless of neighborhood. This assumes that education goes concurrently with economic development and creation of an educated middleclass that will bring political stability, be ripe for evolution into multi-party democracy, see the value in family planning and be aware of how to avoid the ravages of HIV/AIDS. Currently, this is not happening and Sub-Saharan Africa is losing an estimated 70,000 Africans/year fleeing the continent for better opportunities in developed countries (Commission for Africa, 2005), a brain drain which the continent cannot afford. Today one in three (33%) African university graduates works abroad, many educated with Western donor funding (Sogge, 2002a). According to UN statistics

indicating that professionals leaving Africa to work abroad increased from (Sogge, 2002a):

- 27,000 from 1960-1975;
- 60,000 from 1985-1990; and
- 200,000 from 1990-1999.

Other estimates are higher. There are approximately 640,000 African professionals in the U.S., with over 360,000 having PhDs (Sankore, 2005). In total an estimated 30-40% of college graduates from Sub-Saharan Africa have emigrated to developed countries including the U.S., Britain and France (e.g., Gambia/63%, Ghana/46%, Kenya/38% and Angola/33%). Almost 50% of doctors migrate within five years of graduation (Mantey, 2006). “Nigeria alone has 33,000 doctors living in the USA, while the country suffers a healthcare crisis” (Sankore, 2005). Among this brain drain is a critical loss of university faculty to the First World (Schoetzau, 2005).

Many Africans with doctoral and masters degrees are driving taxis in the United States or Europe, since there is no economy to absorb them or because of the low pay relative to the cost of living in their own countries. As the veterinarian graduates from Karen Veterinarian School explained to the principal author in the early 1990s, the majority of the graduating classes over the last three years had had to leave Kenya to find work. In fact,

“at present there are more African scientists and engineers working in the USA than in Africa” (Commission for Africa, 2005).

This has “serious implications for economic growth and development” on the subcontinent and reflects the unstable political and economic environment (Mantey, 2006). While an advisor to USAID in the Caribbean, a U.S. State Department employee, believed to be the CIA operative explained,

“our goal is to identify the best and the brightest in the developing world, send them on scholarship to America and make sure they stay in the United States”.

The planned “Blue Card” of the European Union will also attempt steal the best and brightest to fill skilled labor jobs vacant because of an aging population (see Section 11.4, ECONOMIC DEVELOPMENT AT INDEPENDENCE).

Let's face it, the brain drain from the rest of the World has helped America achieve the status it has today as an economic and military power. Sub-Saharan Africa and the Developing World lose unless economic growth and job opportunities can provide these graduates with economic incentives to remain/return to their country. Otherwise, can one blame them for not coming home?

If the Western donors want to help Sub-Saharan Africa, improving the quality and access to education at all levels must be a priority concurrent with economic growth to allow absorption into the workforce. The new breed of African leaders must make education linked to economic growth priorities and call the shots on how donor money is spent, as opposed to letting expatriate experts, with their biases, determine direction (see Section 11.7.2, Foreign Aid Conditionalities Good Business For Donor Country Not Recipient/Host Country). Care must be given to tailoring education to the need, over-educated individuals often being unwilling to return to rural areas or countries when the level is too elevated (Sachs, 2005).

11.13.2 Health in Sub-Saharan Africa at the Beginning of The New Millennium

All the UN Millennium Development Goals being tracked by the Global Governance Initiative affect health (World Economic Forum, 2004):

- Peace and security—critical to maintaining health services and preventing the violence, hunger, poverty and infections accompanying conflict;
- Poverty;
- Hunger—protein-energy and micronutrient malnutrition reduce resistance to deadly infections and stunt one's ability to learn (see Chapter 5, Section 5.4, HUNGER LINKED TO POVERTY);
- Education—particularly of mothers and girls;
- Environment—water and sanitation, breeding grounds for infectious agents; and
- Human rights—especially of women.

The average life expectancy in Sub-Saharan Africa is 46 (Cobb, 2005) to 47 (Sachs, 2005) years old, compared to Center For Disease Control estimates of 77.6 years in the USA (Medical News Today, 2005). Sachs estimates that 10,000 Africans die/day from poor health care, especially from HIV/AIDS, malaria and tuberculosis. Annual per capita expenditure on health care over much of Africa is very low.

The Commission for Africa (2005) estimates that

“average spending on health per person in Africa in 2001 was between US\$ 13 and US\$ 21; in the developed world it is more than US\$ 2,000 per person per year”.

In the United States, the total health expenditure per capita in (International US\$, 2002) was US\$ 5,274 (WHO, 2006). The Commission for Africa (2005) estimates that to bring appropriate health care, clean water and sanitation to Africa will require an investment by Western Donors of an

“additional \$US 10 billion a year from 2006, rising to \$US 20 billion a year by 2015 as health systems are strengthened”.

Once again, the US\$ 40 billion debt relief of June 2005 by the G-8 will contribute in only a minor way in addressing health and educational needs on the subcontinent. Africa has the highest disease burden in the world (25% versus 75% for the rest of the world) and one of the lowest percentages of health workers in the world (1.3% of world health force). Many doctors and nurses are leaving Africa for attractive, better paying jobs in the West, costing Africa an estimated US\$ 500 million in health care investment. An estimated

“27,000 highly qualified African health workers including doctors emigrated between 1960 and 1975, an average of 1,800 per year. This annual rate had increased to 8,000/year by 1987 and to 20,000/year during the 1990s” (Commission for Africa, 2005).

11.13.2.1 Child mortality as a health indicator

The Commission for Africa (2005) estimates that

“1 in 6 children in Africa dies before reaching their 5th birthday. This is largely because health care delivery systems are at the point of collapse following years of debilitating under-investment” (Also see Chapter 5, Section 5.4, HUNGER LINKED TO POVERTY and Chapter 12, Section 12.6.1, Health and Structural Adjustment).

High infant mortality rates encourage higher fertility rates to compensate for losses, in order to assure adequate members of the family reaching adulthood to take care of their parents in old age. This, in turn, establishes a poverty cycle/trap of under-/malnourished youth with (Sachs, 2005) limited productivity and intellectual capacity.

“The most common health indicator is life expectancy (at birth), largely driven by infant and under-five mortality, since years lost at a very young age have a greater impact on total life expectancy than does extending the life of the elderly. In Sub-Saharan Africa under 5 deaths fell from 253 deaths/1,000 live births in 1960 to 173 in 2001” (World Economic Forum, 2004),

but there is still a long way to go to achieve the target of less than 70/1,000. World-wide, the rate is 80 deaths/1000 live births and the developed region rate is 6/1000 live births (Commission for Africa, 2005).

“On average, life expectancy rises dramatically as per capita GNP reaches \$2,000 and more gradually thereafter...Only in the past century did under-5 mortality in high-income countries fall below 70 deaths per 1,000 live births (Norway, 1930; the United Kingdom and the United States, 1940; Japan, 1950; the Soviet Union, 1980)” (World Economic Forum, 2004).

“In Sub-Saharan Africa the ratio of births attended by skilled health personnel has declined...Significant reduction of maternal deaths at child birth are unlikely to be met” (World Economic Forum, 2004)

unless there are drastic changes in economic development.

11.13.2.2 HIV/AIDS

The prevalence of HIV/AIDS is discussed in Chapter 5 (Section 5.8, HIV/AIDS DECLINING AGRICULTURAL PRODUCTION AND FOOD SECURITY IN SSA) as it will have a major impact on agricultural production in Sub-Saharan Africa.

“Only 1 in 7 of the world’s people live in Africa yet they account for 67% of all people living with HIV and AIDS. And despite efforts to date, prevalence rates are still rising overall. With over 3 million infections just last year, we have yet to see the pandemic peak. Tragic though the effects of the 2004 South Asian Tsunami were, last year’s AIDS death toll in Sub-Saharan Africa was equal to the fatalities of 8 South Asian tsunamis combined (2.3 million). Last year the number of children who died of AIDS in Africa topped 500,000 and the number of AIDS orphans is growing: the projections for 2010 suggest that the numbers will more than double from its 2000 levels to nearly 19 million” (Commission for Africa, 2005).

“AIDS does not just attack an individual. It attacks 3 generations – the person living with HIV and AIDS, the children left behind and the children born with the HIV virus, as well as the grandparents pressed into levels of childcare and food production for which their advancing years ill-fit them (Commission for Africa, 2005)”,

reversing development and ravaging the social fabric. In addition to conflict, HIV/AIDS is beginning to make a major contribution to the numbers of orphans in Sub-Saharan Africa (Commission for Africa, 2005) that place a costly burden on society both economically and socially, especially if they are denied nutritional and moral requirements at an early age, risking to become street urchins in the rural slums and eventually criminals, prostitutes and perpetrators of the HIV/AIDS pandemic. For example, street children in Nairobi, Kenya, have risen from 4,500 to 30,000 in three years (Commission for Africa, 2005).

“In Zambia 71% child prostitutes are orphans, 56% street children are orphans in Lusaka and 78% child domestic workers are orphans in Ethiopia” (Commission for Africa, 2005).

“Access to services for the prevention of mother-to-child transmission of HIV/AIDS was virtually universal in Western Europe, North America and Australia and New Zealand—but 1% in Sub-Saharan Africa, 3–6% in South and Southeast Asia and East Asia and the Pacific and 19% in Latin America and the Caribbean. HIV/AIDS in SSA is a major problem among child bearing women” (World Economic Forum, 2004).

About 6.2 million (62%) of the world’s youth ages 15-24 living with HIV/AIDS (over one billion) are found in Africa. It is estimated that of the youth ages 15-24 with HIV/AIDS in Sub-Saharan Africa, about 76% or 4.7 million are women (Commission for Africa, 2005).

“In Sub-Saharan Africa, for example, only 6% of people have access to HIV counseling and testing, and only 1% of pregnant women have access to treatment to prevent mother-to-child transmission....Only 50,000 of the 29.4 million people with HIV/AIDS in Africa were receiving antiretroviral therapy at the end of 2002” (World Economic Forum, 2004).

Furthermore, “the poorest of the poor are less likely to have adequate housing, nutrition, potable water or sanitation. They also have less access to preventive services (vaccines, micronutrient supplements, insecticide-treated bed nets, malarial prophylaxis and skilled birth attendants) and to treatment (antibiotics, rehydration, anti-malarial and antiretroviral therapy)” (World Economic Forum, 2004).

HIV/AIDS is also affecting the number of qualified teachers.

“In Sub-Saharan Africa, educational achievements are threatened by the HIV/AIDS pandemic, which has claimed the lives of many trained teachers – mainly female teachers in both primary and secondary schools. HIV/AIDS prevention and treatment programs

need to focus on education services to avoid the collapse of already fragile education systems and the reversal of past gains" (ILO, 2004).

Some of the more successful programs involve getting back to traditional values such as Uganda's "ABC" program (Abstinence, Be Faithful, Use A Condom) (Commission for Africa, 2005). In KwaZulu Natal Province, South Africa, with one of the highest rates of HIV/AIDS in Africa, going through traditional Zulu rituals, many young girls are taking vows of virginity until marriage. What this implies is getting back to traditional cultural values, many of which have been lost or degenerated with urbanization and Westernization of African societies, or at least blending traditional values with modern trends. The Commission for Africa (2005) believes that,

"AIDS will not be checked until those combating it take on board cultural factors about poverty and choices, traditions and beliefs, perceptions of life and death, witchcraft and ancestral punishment, power hierarchies and gender norms, social taboos and rites of passage, control of female sexuality and the demand for male virility and pressures for widows to marry close relatives of a husband recently dead from AIDS".

Current Health Initiatives, HIV/AIDS

"The U.S. Congress authorized an Emergency Plan for AIDS Relief, a 5-year, \$15 billion initiative which aims, by 2008, to prevent 7 million new HIV infections, treat 2 million HIV-infected individuals and care for 10 million HIV-infected individuals and AIDS orphans in 14 countries in Sub-Saharan Africa and the Caribbean. Only \$10 billion of these funds are new funds; the other \$5 billion are being diverted from other accounts. Targeted for these resources are 14 countries, 12 in Sub-Saharan Africa and 2 in the Caribbean" (World Economic Forum, 2004).

"Private philanthropic initiatives by foundations and wealthy individuals have also been making a major contribution to global social goals for many years. Estimated international grants by

United States foundations alone reached a yearly average of more than US\$ 3 billion over the 2000–2002 period, of which about two-thirds (67%) went to programs for health, education, international development and the environment” (ILO, 2004).

“The Bill and Melinda Gates Foundation, with assets of \$23 billion, has committed several hundred million dollars to HIV/AIDS prevention, treatment, research and policy programs domestically and internationally. The Henry J. Kaiser Family Foundation has committed \$50 million over five years to ‘Love Life,’ an initiative in South Africa to reduce HIV infection among adolescents by promoting sexual health and healthy futures through the use of high-powered media coordinated with nationwide outreach, support and clinical services. The Rockefeller Foundation has committed \$15 million over five years for medical studies of cost-effective AIDS care in Africa—and another \$15 million over five years to advance research on microbicides, topical gels and ointments that can prevent infection with HIV and other sexually transmitted diseases”. (World Economic Forum, 2004).

“In 2001 Bristol-Myers-Squibb committed \$15 million for a new program called ‘Secure the Future’ to develop ways to prevent and treat HIV/AIDS among women and children and to help communities deal with AIDS. To date, it has allocated 60% of these funds to 130 community projects in five Sub-Saharan African countries. In 2001 an additional \$15 million was committed to projects in four West African countries. GlaxoSmithKline has invested about \$50 million in Positive Action, to help people living with HIV play a more visible role in national HIV policymaking and in fighting stigma and discrimination” (World Economic Forum, 2004).

“Merck launched an initiative in 2000 with the Bill and Melinda Gates Foundation and Botswana to improve the overall status of HIV/AIDS care and treatment there. In June 2001 Pfizer announced a program to provide the resources and infrastructure to provide treatment and clinical training at Makerere University in Uganda through the Academic Alliance. Pfizer also announced that it will offer Diflucan, a drug to combat fungal infections associated with AIDS, free of charge to more than 50 of the poorest and most AIDS-affected nations. Boehringer Ingelheim has promised free nevirapine to any country in Sub-Saharan Africa that desires it for

the prevention of mother-to-child transmission" (World Economic Forum, 2004).

11.13.2.3 Malaria

Sub-Saharan Africa is the region with the highest malaria infection rate in the world.

"At the turn of the 20th century, Africa saw 223 deaths a year from malaria per 100,000 people, only slightly more than other developing regions. By 1970 the rate had fallen to 107 in Africa, compared with only 7 in other regions. But while the decline has continued elsewhere, the death rate has soared again in Africa to 165 per 100,000. Social upheaval and civil wars, a breakdown of health services in many countries, and growing resistance to anti-malarial drugs are to blame" (World Bank, 2000).

Malaria kills at least one million people each year in Sub-Saharan Africa (SSA). According to some estimates, 275 million out of a total of 530 million people in SSA have malaria parasites. Globally, the disease kills more than one million children each year (IDRC, 1996; Schlein, 2004) - 2,800 per day - in Africa alone (IDRC, 1996).

"It is responsible for one in every five deaths in young children in Africa (20%).... more than 75% of the infections and 90% of the deaths from malaria are in Sub-Saharan Africa" (World Economic Forum, 2004).

Each year in Africa, the disease takes the lives of more than 500,000 children below the age of five (Colgan, 2002), and this would be mostly in Sub-Saharan Africa since North Africa's desert climate is not very conducive to the mosquito disease vector.

The use of insecticide treated bed nets has been shown to be a major deterrent to contracting malaria, though it tends to have less than 5% coverage in SSA (World Economic Forum, 2004).

However, a recent survey showed that approximately 15% of young children in SSA slept under a net, but that only about 2% used nets that were treated with insecticide (ITNs) (WHO, 2003). Recent research shows potential for a fungus that can be put on walls and ceilings of homes that kills mosquitoes. Additional research, among others, is needed to determine how long this fungus survives in the hot humid environment where mosquitoes are prevalent (Berman, 2005).

People who become ill with the disease need prompt and effective treatment to prevent the development of severe manifestations and death. Since the 1980s, parasite resistance to chloroquine, the most commonly available anti-malarial drug, has emerged as a major challenge (WHO, 2003). The World Health Organization (WHO) recommends artemisinin-based combination therapy (ACT) (WHO, 2003; Schlein, 2004), derived from wormwood, an ancient Chinese herb (Stokes, 2006), which is highly efficacious and promises to delay the emergence of resistance. WHO recommends that artemisinin be used in combination with one other drug (e.g., often based on quinine) in order to avoid the risk that the malaria parasite will one day resist the drug, as has happened in the past with all previous malaria therapies. Artemisinin Combination Therapies (ACTs) are 95% effective in curing malaria (Stokes, 2006). So far however, its use is constrained by high costs and limited operational experience in Africa. To date, four African countries have adopted ACTs as first-line treatment (WHO, 2003; Schlein, 2004).

“It costs \$2.40 a dose for ACT, compared to the cheaper, but now ineffective Chloroquine, which costs about 10 cents a dose. For the past two years, WHO has been urging countries where there is resistance to conventional treatments to switch to ACT. Since

then, 15 African countries and 14 outside Africa have taken this advice” (Schlein, 2004).

“The impact of malaria on pregnant women and their newborns can be substantially reduced by the recently recommended use of ‘intermittent preventive treatment’ (IPT). This strategy provides at least two treatment doses of an effective antimalarial at routine antenatal clinics to all pregnant women living in areas at risk of endemic falciparum malaria in Africa (irrespective of whether they are actually infected with malaria or not). About two-thirds (67%) of pregnant women in Africa south of the Sahara attend clinics for antenatal care, and incorporating IPT for malaria into their routine care should be straightforward. Now an integral part of the ‘Making Pregnancy Safer’ strategy, IPT has been adopted as policy by six countries to replace chemoprophylaxis; most other countries in the region are reviewing their policies in the light of the new recommendation” (WHO, 2003).

The ‘Global Fund to Fight AIDS, Tuberculosis, and Malaria,’ created in 2002, finances high-quality programs to fight the three diseases worldwide (Schlein, 2004; World Economic Forum, 2004).

“Some 70% of the 14 million people worldwide who have both HIV and tuberculosis (TB) (which are often linked) are in Africa, where the TB epidemic is rising by 4% a year and is now the most common opportunistic infection of people living with HIV” (Commission for Africa, 2005).

Since it was established two years ago, the Fund has given more than \$500 million for malaria programs globally. Half of that amount has gone for malaria drugs. The WHO estimates it will cost about \$1 billion a year to provide 60% of the needy populations with ACT (Schlein, 2004), such as through the WHO conceived “Roll Back Malaria” Plan started in 1998, having the following goals set for 2010 (WHO, 2003).

11.13.2.4 Safe drinking water in Africa as a health indicator

The World Bank (2000) estimates that only 47% of the people in Sub-Saharan Africa have access to clean water and adequate sanitation facilities. Cobb (2005) estimates 82% of urban residents and only 47% of rural residents of Sub-Saharan Africa have access to improved drinking water. The Commission for Africa (2005) estimates that

“More than 300 million people – some 42% of Africa’s population still do not have access to safe water. Around 60% still do not have access to basic sanitation”.

Providing safe drinking water for Africa would make one of the largest contributors to improved health and decreased child mortality from diarrheal diseases in SSA.

11.14 CONCLUSIONS

Foreign aid has been a tool of neo-colonialism to maintain dependency on former colonial powers at independence, as a means of assuring the continued flow of raw products needed to stimulate European economies. This expanded during the Cold War, as Western donors created welfare states as a means of warding off the Eastern Bloc, Sub-Saharan Africa serving as a chessboard in a global game of ideologies. It is big business for Western consulting firms “Beltway Bandits” and NGOs. Little or nothing reaches the poorest of the poor, while political elites, often puppets of the West, are bought off and even maintained in power with these moneys. Living on welfare means that Sub-Saharan African governments have little or no need for the local private sector or to sustainably manage their natural resources, which can therefore be mined by these elite for short-term profit, and/or mined by the rural poor trying to survive on limited open access

resources, getting minimal value on black/parallel markets, while population pressures on these resources increase. It also means that these political and bureaucratic elite have more allegiance to Western donors and NGOs than to their own citizens and are unaccountable to their citizens since they do not depend on them for survival through taxation, as in much of the world. Meanwhile, sweet deals with the international private sector allows the West to use its technologies to extract Sub-Saharan Africa's natural resources, ship them out raw and obtain added value in the home country. This will be discussed in Chapter 13.

Until there is a majority middleclass and growing economies, there will be a tendency to fall back onto the "security blanket", the communal support base (e.g., extended family, village, ethnic group, religious group, region, etc.) helping nourish the clientele who keep the "Big Man" in power and that encourages corruption. Until resource and land tenure are addressed in which individuals and/or groups have legal access to and stand to benefit from the sustainable use of their resources, democracy as currently practiced on the subcontinent, will be a superficial process, a façade, in which nationalized assets will continue to keep a small politburo of elite in wealth and power.

Sub-Saharan Africa has also served as a dumping ground for cheap Western Food Aid, which keeps subsidized non-competitive European and American farm production in business, while undercutting African agricultural production. America and Europe can feed themselves. Sub-Saharan Africa cannot. This dependence on food aid is a disincentive to Sub-Saharan Africa and, as suggested in Chapter 5, there is a need to develop a continental-wide plan of food production. Why worry, as in Zimbabwe, if the World Food Program (WFP) of the United Nations will feed us; but for how much longer, especially as the global grain deficit increases, as well as human populations both in Africa and globally?

Foreign aid has also been extremely destructive to the environment; from subsidized beef in southern Africa as part of the Lomé Convention, to empowering Western NGOs, with little or no training in tropical resource management and Western urban biases, to determine conservation solutions that tie-up natural resources and compress Africans into smaller and smaller non-sustainable areas in the creation of more parks and protected areas; premonitions of the colonial era described in Chapter three.

Most of Sub-Saharan Africa is still closely tied to the natural resource base for survival. Western funded solutions are pushing to convert at least 10% or more of Africa into exclusions zones, “parks and protected areas”, which disenfranchise, alienate and impoverish rural communities. Parks and protected areas as currently managed, most often with foreign aid funding through Western NGOs, turn communities into poachers and guarantee that the natural resources will be uncontrollably mined for short-term gains – survival. Without the cooperation of the greater society, government game and park department bureaucrats will not be able to control access to these areas nor sustainably manage their resources. Foreign aid-driven conservation “talks community” but “acts neo-colonial”. In a number of instances, consideration should be given to taking Western NGOs and donors to the International Criminal Court (ICC) for eco-genocide of entire cultures.

Even if 80% or more of the benefits can go to rural communities from community-owned safari and tourism companies, as well as the sustainable harvesting of game for bushmeat, trees for timber and charcoal, fish and wild medicines, in most cases there are not enough resources or income generated to significantly impact the average head of household in rural areas and that is a fact that the conservation and agricultural communities must own up to. What does this mean?

As currently structured, foreign aid should be eliminated, as 70-90% goes back to the donor country of origin anyway, mainly to consulting firms, “experts” and NGOs, rarely reaching the poorest of the poor. Foreign aid employs expatriates who bank the majority of their income back home, and gives “Learn to Love America Trips” to politicians and bureaucrats, adding little or no value to the continent. Foreign aid is government-to-government and does not create economies. A significant portion could go to provide low interest loans and/or grants for the international private sector to joint venture and transfer technology to the subcontinent, both in the extraction of primary resources and in their transformation on the continent.

Foreign aid might have a positive role to play; in health and education, both in training rural people to better manage “their” natural resources, but also in preparing the majority for a life working in an increasingly urbanized and what must become an industrialized Sub-Saharan Africa, including IT (Information Technology). A healthy society is one that is adequately nourished and relatively free of disease so as to both learn and to be productive in the work place. Education on the African subcontinent must be a priority over the next 25 years in order to produce a middleclass able to compete in a global society and a critical mass of rural Africans who can manage “their” natural systems. In order for Africans to take advantage of First World tertiary education, as in South Africa and elsewhere, a priority must be to assure that educational standards in primary and secondary schools meet international norms, with one twist. In addition to reading, writing and arithmetic, Sub-Saharan Africa’s educational systems need to orient students towards practical life skills; in rural areas how to better manage their soils, forests, range, fish and wildlife, while in urban centers how to fit into a global economy. The sustainable management of Sub-Saharan Africa’s agricultural and natural resources and their transformation is what will drive the

economies of the subcontinent. As Alec Erwin, South African Minister of Trade and Industry, said we'll take your foreign aid if you wish to help us, but we'll use our experts to design appropriate programs and buy our manufactured goods. This must include a transparent and accountable system that plans development with the people and not for the people, along with good governance.

In reality, if Sub-Saharan Africa controlled the harvest and transformation of its resources, the resource richest continent in the world would not be the poorest continent in the world and it would not need foreign aid and all the baggage, which accompanies it.

Chapter 12

12.0 SUBSIDIES, FREE-TRADE, STRUCTURAL ADJUSTMENT AND DEBT RELIEF IN SUB-SAHARAN AFRICA - IMPACTS ON RESOURCE EXPLOITATION

“By the 1990s, U.S. foreign policy was no longer defined primarily by the military influence of the Cold War but by its ability to mold societies through economic intervention. By influencing the patterns of resource control, legislation and monetary policy within developing countries, whether through the International Monetary Fund (IMF) and World Bank’s imposed structural adjustment (SAP) programs or through free-trade policies implemented by the World Trade Organization (WTO) and the North American Free-Trade Agreement (NAFTA) the U.S. Government has found new ways to keep developing countries safe for its brand of capitalism” (Willsea, 2003).

“To a degree unparalleled in history, outsiders have introduced, even imposed, reforms intended to change the way sovereign governments organize themselves and spend their money. Donor agencies crafted the reforms, financed them and played a big role in their implementation”, (Berg, 2000 *In: Sogge, 2002*), Elliot Berg speaking in the late 1990s on 15 years of development failure.

“The LDCs⁴⁵⁵ (including Sub-Saharan Africa) are trapped in a vicious circle of interlocking handicaps including poverty and illiteracy, civil strife, geographical disadvantages, poor governance and inflexible economies largely dependent on a single commodity. In addition, many are also burdened by high external debt and hard hit by the continuing decline in the price of primary commodities. These problems have been compounded by continuing agricultural protectionism in the industrialized countries. This restricts market access while subsidized imports undermine local agricultural producers” (ILO, 2004).

⁴⁵⁵ Least Developed Countries.

“Japan, Western Europe, and the United States have more to offer the world than restrictive trade barriers and the persistent custom of protecting the domestic farm at all costs. As a lesson from their own history, the First World nations know that an export potential is crucial to developing economies. They could foster greater investment and growth in the Third World by simply living up to their frequently espoused ideals of free-trade.

The citizens of the First World nations should be proud to be able to feed the impoverished Third World, and much of the formerly communist Second World, but they must recognize that this abundance is not due to the competitive strength of the agricultural sector as much as it is due to those businesses, workers, customers, and taxpayers who must shoulder the burden of subsidies and high prices. This represents a tremendous misallocation of resources and lost productivity for both the developed and the undeveloped nations. The poor in all nations, First and Third, suffer as a result.

It is time that the United States, Western Europe and Japan set a better, more consistent model for the Third World to emulate” (Schoolland, 2002).

This chapter will discuss Western subsidies, structural adjustment (SAP) and debt relief and how they impact on Sub-Saharan Africa’s economies, people and natural resources.

12.1 COMMODITY DEPENDENT, AFRICAN GOVERNMENTS FALL IN-DEBT – SPIDER WEB OF THE WORLD BANK AND IMF

“It consists of taking out of a country its export products and selling imported products to the native population which has received money for the exports. It is an elementary circle in which the market, so far as is possible, is in the hands of the mother country, and the colony is condemned to produce raw products without manufacturing them at home” (Dresch, 1950 *In: Dumont, 1966*).

“We think we are the donors because when I produce a kilo of coffee and sell it raw to the West, I get \$US 1 per kilo. When

someone (middleman) takes it to England he gets \$US 10. Not only do I donate money, I donate jobs. Those who roast the coffee get the jobs" (President of Uganda, Yoweri Museveni *In:* Geyer, 2005).

As will be seen below and in Chapter 13 on the private sector, a major goal of Western foreign policy towards Sub-Saharan Africa was/is to continue this flow of raw products off the continent and into the West's industrial complex. In fact, Sub-Saharan Africa is the only region in the world where the ratio of manufactured goods to exports has fallen, condemning it forever to being nothing more than a resource exporter unless drastic measures are taken. Disinvestment is occurring at the precise historical moment when the information technology revolution has transformed the infrastructure of production, management and communication elsewhere in the world. The upshot is that Sub-Saharan Africa's firms and labor are alienated from the workings of the new global economy, while Sub-Saharan Africa's elites are integrated into the global networks of wealth, power, information and communication. (*Castells, 1997 In: Hoogvelt, 2002 In: Zack-Williams, Frost & Thomson, 2002*).

12.1.1 Historical Perspective

"From the 15th into the 19th century, Africa's primary link with the world was through the export of slaves. In the 19th and 20th centuries, export of raw materials became the dominant link. This role as commodity supplier—whether of high-valued ivory, gold, diamonds, and oil or of precariously priced crops such as coffee and cocoa - largely excluded Africa from the more dynamic sectors of manufacturing, financial services, and information technology" (Minter, 2001).

"This condemned developing countries to vassalized producers of raw products, primarily agriculture and mineral, with low buying power to purchase equipment and manufactured products" (Dumont, 1966).

“Apart from in a few cases where the colonial power might actually set up wholly owned manufacturing plants in the colonized area, manufacturing or processing was forbidden. This is, of course, one reason for the extremely low level of development in many LDCs, particularly African countries, most of which only gained their independence in the last fifty years (most beginning around 1960). Since independence, the economic relations between most African countries and their former colonial powers have hardly changed at all. Coming to independence with little or no industry, the only source of foreign income for most was continued export of raw resources and borrowing, with the latter leading to the serious debt situation that cripples so many LDCs today” (Copeland, 2000).

“Today, structural adjustment policies, which continue this trend, are also believed to be a major source of environmental degradation” (Bond, 2002)

as Sub-Saharan Africa’s resources, both renewable and non-renewable, are being mined for short-term gains with little regard to developing the subcontinent or transforming its people.

“Kofi Annan of Ghana, the first United Nations Secretary-General from Sub-Saharan Africa, divides this era (post-colonial) into two ‘waves.’ the first, during the 1960s and 1970s, was characterized by post-colonial enthusiasm and economic advance; the second, running from the 1980s to the early 1990s was ‘too often marked by civil wars, the tyranny of military rule, and economic stagnation.’ Autocratic leaders, whatever their proclaimed political ideology, turned to police state repression and Cold War patrons to stay in power. The worst perpetrated enormous human rights abuses. Even the best failed to deliver on the hopes of independence regarding political liberties, social services, and economic improvement. Thus, much of the economic advance of the 1970s was rolled back in the 1980s and early 1990s as a result both of internal failure and a tougher world economic climate, including the oil crises in the 1970s, a steady fall in world prices for Africa’s leading agricultural exports, and the linking of international assistance to draconian structural adjustment policies (SAPs or ESAPs)”⁴⁵⁶ (Minter, 2001).

⁴⁵⁶ Economic Structural Adjustment Program (ESAP) ≈ Structural Adjustment Program (SAP)

Globalization replaced old dictatorships of national elites with new dictatorships of international finance. Structural adjustment took on a life of its own in the 1980s under the Reagan/Thatcher administrations, where the IMF and the World Bank moved from Keynesian economics, that looked to government policies to help overcome market failures, to “free-market” economics that wanted governments out of the way (Stiglitz, 2002), at least for developing countries. The IMF and World Bank became the “chef and sous chef” and structural adjustment became the “recipe” that was supposed to fix, but ended up “cooking the economies” of the developing world. Structural Adjustment (ESAP or SAP), neoliberalism and the Washington Consensus⁴⁵⁷, which will be discussed below, signify a philosophy that has roots in 19th century *laissez faire* political and economic theory, but which came of age in the 1970s (Bond & Manyanya, 2003).

The World Bank, the International Monetary Fund (IMF) and various Western bilateral aid agencies—including the (U.S.) Agency for International Development (USAID)—played a central role in undermining efforts by the post-independence generation of Sub-Saharan Africans to improve basic social services. Beginning in the early to mid-1980s, the World Bank, the IMF and the U.S. began preconditioning aid and loans to Sub-Saharan African countries on acceptance of structural adjustment policies, which included slashing government spending (Minter, 2001). A major goal was to de-legitimize and shrink public powers over firms and capital controls (Sogge, 2002).

“This generation’s failings were also considerable and painful—repressive, ineffective, and corrupt bureaucracies, military dictatorships, and one-party states; deep indebtedness to international institutions and banks; a stifling of grassroots initiatives, public debate, and other civil liberties. These failings were compounded by an international system that fostered ill-conceived, nonfunctional, and costly development projects, heavy

⁴⁵⁷ Free-market consensus between IMF, the World Bank and the U.S. Treasury about the “right” policies for developing countries (Stiglitz, 2002).

financial borrowing, and Cold War-linked civil wars, which left newly independent countries with little economic cushion or political leeway for policy errors” (Minter, 2001).

The net result of Western interventions in Sub-Saharan Africa has been a form of “economic Apartheid”.

“Global Apartheid, stated briefly, is an international system of minority rule whose attributes include: differential access to basic human rights; wealth and power structured by race and place; structural racism, embedded in global economic processes, political institutions and cultural assumptions; and the international practice of double standards that assume inferior rights to be appropriate for certain ‘others,’ defined by location, origin, race or gender. Global Apartheid thus defined, we believe, is more than a metaphor. The concept captures fundamental characteristics of the current world order missed by such labels as ‘neoliberalism,’ ‘globalization’ or even ‘corporate globalization’ ” (Booker & Minter, 2001).

12.1.2 Today, Raw Products Continue Flowing

Despite two decades of structural adjustment policies, Sub-Saharan Africa owed the West US\$ 219 billion in 1997, compared to US\$ 60.9 billion in 1980 when the debt crisis broke (Hoogvelt, 2002 *In: Zack-Williams, et al.*, 2002). Today, Sub-Saharan Africa’s primary exports remain unprocessed agricultural products and, for a handful of countries, minerals and oil (CIA, 2002).

“Even South Africa’s relatively developed economy is extremely vulnerable to the fluctuating price of gold. Although Ghana, one of the World Bank’s ‘success stories,’ increased its income from nontraditional commodities to 18% of total export earnings by 1996, most export revenue still came from cocoa (32%) and gold (45%). Countries that depend almost exclusively on agricultural exports, such as Rwanda and Burundi, are most vulnerable. Oil producers, such as Nigeria and Angola, may be better off in

comparison, but they endure boom and bust cycles as the world oil price shifts" (Minter, 2001).

Africa has an estimated 30% of the world's minerals. It accounts for about 15% of the world's copper production. However, an abundance of certain resources has not meant any rapid development of the continent, which remains one of the world's poorest regions (Van Wyk, 2000).

Natural resources remain an important source of foreign exchange for states in southern Africa. African exports consist of a much higher share of primary commodities, "raw products", (over 60%) than the average for the rest of the world (less than 25%) (Van Wyk, 2000). Major exports have remained essentially the same since the 1960s, with most of Africa being heavily dependent on one or two primary products; agriculture, minerals or timber accounting for 90% of Africa's foreign exchange (Martin & O'Meara, 1995), with little or no added value from transformation. Africa is heavily dependent on the export of 70% raw products versus 30% transformed products, the opposite of the rest of the developing world,

"although paradoxically its share in world commodity exports has declined in the last two decades. Second, the majority of Africa's non-fuel commodity exports have been subject both to high price volatility and a secular decline in real prices. Third, commodity exports are not generating sufficient savings for investment in diversification and in the development of human and physical infrastructure. The continent has therefore been caught in a downward spiral where such dependence and its attendant ramifications have become a structural feature of many of Africa's economies, and the 'commodity trap' in which these countries are caught has become essentially a 'poverty trap'" (Kousari, 2004).

An economy dependent on the export of primary products

“contributes to Africa’s vulnerability in world markets. Prices tend to flux. Since the 1970s, Africa’s market share for these commodities has declined. Market share losses were 40% for commodities such as copper, timber and coffee, almost 60% for iron ore and 30% for cotton and cocoa. This is reflected in the continent’s declining share of world trade. Africa’s failure to develop and expand alternatives to export products such as manufacturing is also reflected in this. As consumption of natural resources by modern industrial economies remains very high (45 to 85 metric tons per person annually) African states will continue to deliver the goods to earn foreign currency. It currently requires 300 kilograms of natural resources to generate US\$ 100 of income in the world’s most advanced economies” (Van Wyk, 2000).

“From 1980 to 2000, the price of sugar fell by 77%, cocoa by 71%, coffee by 64% and cotton by 47%. Africa’s export prices are nearly four times more volatile than those of developed countries” (Commission for Africa, 2005). This negatively impacted “between 20 and 25 million rural coffee growers in Africa, 10 million workers directly employed in cocoa production and 15 million in the cotton sector” (Commission for Africa, 2005).

While the rest of the world has seen income increase from trade in primary products, Africa as a whole and Sub-Saharan Africa have stagnated, as measured by UNCTAD⁴⁵⁸ in 1980 prices (Kousari, 2004). Declines in raw commodity prices often stem from market surpluses from domestic farm subsidies and support (e.g., cotton, groundnuts, sugar and wheat) in developed countries (Kousari, 2004), while in other cases, structural adjustment has encouraged developing countries, relying on one or two primary products to produce those products (e.g., coffee, cocoa, tea), resulting in an over supply and a concomitant drop in global prices for producers. Advances in production technology in Latin America and Asia, land expansion in Brazil and new producers, such as cocoa

⁴⁵⁸ United Nations Conference on Trade and Development (UNCTAD)

production in Malaysia in the 1970s/80s and tea/coffee in Vietnam in the 1980s/90s, resulted in overproduction of these commodities (Kousari, 2004).

In manufactured exports, Africa recorded an average annual growth rate of 6%, less than half the developing country average in the same period.

“This growth has been concentrated in a handful of African countries. In a ranking developed by UNCTAD of the 225 most dynamic products in world trade in terms of growth in export value, Sub-Saharan Africa produces and exports only two products among the first 50, i.e. undergarments (5th in ranking) and outer garments (50th in ranking) and these are concentrated in Mauritius, Lesotho, Swaziland and Botswana”,

revealing that SSA barely participates in trade in market-dynamic products (Kousari, 2004). China is quickly putting the textile industry of southern Africa out of business (see Chapter 13, Section 13.13.6.2, AGOA).

G-7⁴⁵⁹ countries have 12% of the world's population, but they use over 70% of its resources in cash terms (Booker & Minter, 2001) and appear to do whatever it takes to keep these raw resources rolling in as cheaply as possible to stimulate their economies and support their material-based lifestyles. IMF/World Bank Structural adjustment policies, subsidies, tariffs and other restrictions are the economic tools used by the West to keep the raw products flowing from Sub-Saharan Africa and other developing countries.

⁴⁵⁹ G-7countries include the U.S., Britain, Canada, France, Germany, Italy, Japan, while G-8 countries are G-7 + Russia.

12.2 SUBSIDIES AND FREE-TRADE

“Thus, status quo in world relations is maintained. Rich countries like the U.S. continue to have a financial lever to dictate what good governance means and to pry open markets of developing countries for multinational corporations. Developing countries have no such handle for Northern markets, even in sectors like agriculture and textiles, where they have an advantage but continue to face trade barriers and subsidies. The estimated annual cost of Northern trade barriers to Southern economies is over US\$ 100 billion, much more than what developing countries receive in aid” (Centre for Science and Environment, 2002 *In: Global Issues*, 2002a).

All in all, rich country protectionism is estimated to cost developing countries US\$ 100 billion/year, twice as much as they receive in foreign aid (Guest, 2004). The World Bank (2000) estimates an annual loss of trade since the 1960s of US\$ 70 billion/year to Africa, reflecting a failure to diversify into new, dynamic products, as well as a falling market share for traditional goods.

While the United States, the European Union (EU) and the Cairns Group have allied to emerge as the biggest food exporters, at stake is the very survival of over 1.5 billion small and marginal farmers of developing countries. With food poised to become the weapon of the future, the biggest threat is food sovereignty and economic independence. The U.S. and the EU together, account for 35% of the global trade in food and agriculture (Sharma, 2002). The Cairns Group, comprising 17 food-exporting countries,⁴⁶⁰ accounts for over 33% of the world’s agricultural exports (CAIRNS, 2005), with more than 67% of the food trade in the hands of these three major food-exporting blocks (see Chapter 13, Section 13.7, GLOBALIZATION AND MULTI-NATIONALS – CORPORATE

⁴⁶⁰ The Cairns Group consists of Argentina, Australia, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Guatemala, Indonesia, Malaysia, New Zealand, Paraguay, the Philippines, South Africa, Thailand and Uruguay.

CAPITALISM). Trade liberalization has helped American exports double over the past 15 years to US\$ 53.5 billion estimated for the current fiscal year (2002), while the EU has increased its performance from 13.5% to 17% of global food trade, in the same period. The U.S./EU are pushing developing countries to conform with the World Trade Organization (WTO) obligations of phasing out or lifting Quantitative Restrictions (QRs), allowing easy penetration by American and European farm commodities and processed products. Once these countries become dependent on the U.S. and other developed countries for food, the battle for food supremacy, a basic human right, is won (Sharma, 2002). Sachs (2005) tends to agree that trade liberalization benefits will mainly accrue to large food exporters: The United States, Canada, Argentina, Brazil and Australia, but not necessarily greatly to Sub-Saharan African countries.

12.2.1 World Trade Organization (WTO)

The WTO, establishing the rules governing the international trading system, is a successor to the General Agreement on Tariffs and Trade (GATT) and was formerly established in January 1995. The trading system over which the WTO presides is about 50 years old, linked to GATT that was established in 1947. Within the WTO, the Quadrilateral Group of the USA, Canada, the European Commission (EC)⁴⁶¹, Japan, Luxembourg and Sweden dominate the WTO, with many decisions made behind closed doors (Boateng, 2004). In 2001, while 80% of the WTO members were developing countries, 80% of the staff were from developed countries. Of 512.5 posts, 39.5 were vacant or under recruitment, 410 were filled by people from developed countries and 94 from developing countries

⁴⁶¹ The European Union (EU) is a family of democratic European countries, committed to working together for peace and prosperity. There are five EU institutions, each playing a specific role: European Parliament (elected by the peoples of the Member States); Council of the European Union (representing the governments of the Member States); European Commission (EC) (driving force and executive body); Court of Justice (ensuring compliance with the law); Court of Auditors (controlling sound and lawful management of the EU budget) (EU, 2004).

(Jawara & Kwa, 2004a). Developing countries, as in CITES (see Chapter 10, Section 10.3.1, CITES A Western Control Mechanism Over Africa's Natural Resources and Development and Section 10.4.3, U.S. Government Threatens African Countries With Foreign Aid Cuts), are bullied and coerced into threats of withholding technical assistance, financial aid, bilateral and multilateral debt and preferential trade agreements. This forces developing countries into walking a fine line between safeguarding short-term benefits and long-term interests, locking them into political impotence, unfair-trade rules and weak trade performance, leaving many to question if the WTO can serve the developing world (Jawara & Kwa, 2004b).

12.2.2 Subsidies, Don't Do As I Do, Do As I Say

“The relative success of the American economy is a function of the global competitive rules, which suit the most advanced, and which positively disadvantage and impoverish others” (Legum 2002).

Both the USA and Europe subsidize and protect many of their markets. In fact, governments are central to the modern capitalist system (Chomsky, 1999), assuring protection for weak markets, food production, universal rights to good and free, if not inexpensive or subsidized, education (guaranteed free in the USA through secondary school and subsidized at the tertiary level through state universities) and health services for the needy, as well as food relief when necessary. Similarly, Sachs (2005) states that all successful economies are mixed economies relying on a balance between the public and private sector for economic development, with public support for financing education, medical and agricultural research and health care, all of which were denied developing countries under this model (e.g., Structural Adjustment). In fact, public spending in the United States in these areas at the local, state and federal level combined is about 30% of the GDP (Sachs, 2005).

In the United States, in one way or another, everyone is tied to the government and government services. A large segment of society works for federal, state, county or municipal governments. The majority of defense contractors and consulting firms live off of the government dole, as work is “farmed out” to the “private sector”, known around Washington, D.C. as “Beltway Bandits”. In the USA, to assure a minimal standard of living there are various forms of social support from the government including welfare, food stamps, unemployment benefits, Medicare (health care for people over 65 years of age) and Medicaid (health care for low income families). It is a complete illusion that the USA is a free wheeling *laissez faire* capitalist society, with little or no intervention by the state. America is as much a liberal social democracy state as Sweden, France, Britain or Italy. As in these countries, Americans democratically elect their leaders to provide them with this social welfare. Chua (2003) considers this the means by which Western capitalism cushions the harshness of this system to the majority, in essence creating a middleclass that closes a blind eye to the fact that an elite minority control the majority of the wealth. There is nothing wrong with assuring a country’s citizens a guaranteed minimum quality of life and equal opportunities through higher education to advance oneself. However, citizens in developing countries should not be denied the same opportunities through stifling IMF/World Bank policies, trade barriers and subsidies.

Meanwhile, in the developing world, and in particular Sub-Saharan Africa, the majority of citizens get by with no insurance of any kind; no unemployment insurance, no health insurance and no retirement insurance; this safety net seen by Western society as an essential element for a healthy economy. The protection that does exist is supplied by the family and community instead of the government (Stiglitz, 2002). Yet people ask why Africans have such large families and what the importance of the extended family/communal network is. Well this is one major reason - a safety net for the majority, especially in times of

sickness, drought or old age, necessary in SSA's declining and/or stagnating economies that are endemic to the subcontinent.

President Truman's Air Force Secretary put the matter simply: we would not use the word "subsidy", he said, we would use the word "security". He made sure the military budget would "meet the requirements of the aircraft industry". What this helped spawn was a civilian aircraft industry, now the country's leading export, and the huge travel and tourism industry, which is aircraft-based. In fact, today the world's production of aircraft is virtually a monopoly of large-scale subsidized industries, Boeing-McDonald (USA) and Airbus (France/England joint venture). The same pattern prevails in computers and electronics, automation, biotechnology, communications, in fact in just about every dynamic sector of society. Under the Reagan Administration, more relief was granted to U.S. industry than by any of his predecessors in more than half a century, presiding over the greatest swing in protectionism since the 1930s. Virtually all the world's largest core "Transnational Corporations (TNCs) or multi-nationals) are heavily subsidized and/or protected by trade barriers (e.g., tariffs and quotas) and at least 20 companies in the 1993 Fortune 100 would not have survived at all as independent companies if not saved by their respective governments. Lockheed, a U.S. - based aerospace industry, was saved from collapse by government loans. Bailouts have been seen in the aerospace, electronics, modern agriculture, materials technology, energy and transportation technology (Chomsky, 1999). So much for "free-market" systems and policies in the West. Recently, both America and Japan announced new programs for the funding of advanced technology in aircraft and semi-conductors to sustain the private sector through public subsidies.

If one looks under the rug, government subsidies can be found in much of the "private sector" research in everything from genetically modified crops to stem cells. In America, there is a large gray area over what is private versus public

sector. Farmers are subsidized to assure that America always has food, and uncompetitive industries, such as sugar and steel, are protected.

12.2.3 Free-markets?

Most of the “advanced industrial countries” (e.g., G-7) built their economies by selectively protecting some of their industries until they were strong enough to compete with foreign companies. Meanwhile, poor developing countries have been pushed to eliminate their trade barriers (Stiglitz, 2002).

By 2000, the USA had lifted only 13 of 750 restrictions to “free-trade” acknowledged in the Uruguay round of the General Agreement on Tariffs and Trade (GATT); the EU 14 of 219 and Canada 29 of 295 (Legum, 2002).

In 2003, after a challenge in the World Trade Organization (WTO) by the European Union (EU), together with Japan, Korea, China, Switzerland, Norway, New-Zealand and Brazil, the EU threatened the USA with US\$ 2.2 billion in sanctions on products from the USA plus legal proceedings through the WTO (Cox, 2003 & Lamy, 2003). Beginning with 100% tariffs on many U.S. steel products, the list moves on to include clothing, industrial machinery, farm produce, paper and even brooms, pens and juice (Santamaria, 2003), as well as citrus, fruit, rice and steel (Cox, 2003). Of the 1,866 items on the list, the majority are common consumer products. Meanwhile, on December 4, 2003, the U.S. announced the full and immediate termination of its steel safeguards that placed tariffs as high as 30% on imported steel products (Lamy, 2003).

“Thus Free-trade is not good for everyone and African countries face huge barriers in establishing an agro-export economy to trade their way out of poverty because of tariff barriers and produce dumping by European and U.S. producers. Trade rounds ostensibly benefit the whole world by enhancing competitiveness, expanding the marketplace to increase trade volume; enhancing the value of the goods we trade. These assumptions are based on fundamentally flawed principles. Trade has the potential to contribute to food security, but in practice two sets of rules have been enforced: one for those allowed to and responsible for distorting the market through tariff and non-tariff barriers, and those – the developing countries – who were not and are now legally prohibited from doing so” (Roman, 2003).

In fact, as will be seen, free-market, neo-liberal, Washington Consensus structural adjustment principles imposed on the Developing World are a hypocritical “don’t do as I do, but do as I say”, approach to economics. The sad thing is that so many developing country leaders have fallen for this model, long abandoned or never used by the West except against other countries where government steps aside and leaves everything up to the private sector, where profit is the bottom line, not people and their welfare. For instance, subsidies, quotas and protective tariffs are a “no no” in free-trade theory, which is applied to the Developing World across the board, but only when it suits the West in spite of the West-controlled World Trade Organization (WTO) that is supposed to assure that all parties abide by “free-trade” principles. However, in reality, the WTO appears to be a tool for “exporting American values”, especially deregulation, allowing foreign investors to invest without restriction in central areas of the host country’s economy. This impacts about 70 countries, which are signatories (Chomsky, 1999). Commercial interests dominate the WTO, putting trade above everything else, including the environment and the poor. Meanwhile, while “free-trade” is imposed on the developing world, the U.S. government seems capable of violating trade agreements at will, the United States ignoring WTO rulings,

behaving with others multilaterally where it can and unilaterally as it must (Chomsky 1999).

12.2.4 Agricultural Tariffs and Subsidies

As discussed in Chapter 11, Section 11.8, FOOD AID, excess subsidized food is often dumped on the developing world for a variety of reasons.

While African governments are not allowed to subsidize agriculture based on structural adjustment policies, the EU and America do the opposite (Palmer & Kline, 2003 & Roman, 2003). Developing countries have been forced to “discipline” their subsidy norms as per the WTO’s Agreement on Agriculture, allowing for a maximum limit of 10% of subsidy support under the Aggregate Measure of Support (AMS) clause. The majority of the developing countries have eliminated farm subsidies and dismantled agricultural extension systems, South Africa being a prime example. Food supremacy is being handed over to a few food-exporting countries, while developing countries are emerging as food dumps. The world is being told that “precision” farming, a term applied for high-tech agriculture, is the only environmentally sound method of farming. The entire focus is to force the developing countries to sacrifice food self-sufficiency at the altar of world trade (Mittal, 2001; Shah, 2001 & Sharma, 2002).

“It also seems a tad hypocritical of us to complain about governance in third-world countries when we allow tiny groups of farmers to hijack billions of dollars out of our taxes” (Kristof, 2002).

12.2.4.1 Agricultural tariffs

The average import duties on farm products to the EU and America are 40-50% (Legum, 2002). According to the Commission for Africa (2005)

“Average applied tariffs in agriculture in the EU are 22%, and in the U.S. 14%, some 3-4 times higher than in manufactured goods. There is also substantial use of ‘tariff peaks’, or very high duties on specific products. These affect over 40% of agriculture tariff lines in the EU and Japan”.

As an example, tariffs on peanuts coming into the U.S. are 132% (Commission for Africa, 2005). The EU, paradoxically one of the leading proponents of trade liberalization, has one of the most protected agricultural sectors in the world through its Common Agricultural Policy (CAP) (Sharma, 2002). For instance, canned fruit going to the EU from South Africa has a tariff of 15-30%, while tariffs as high as 30% are placed on apricots and other fruits going to the U.S., weakening a fruit industry valued at Rand 1.5 billion that is employing 27,000 people in South Africa (Moneyweb, 2005). September 2003 WTO discussions in Cancun, Mexico, collapsed over differences between the West and the developing world concerning agricultural subsidies and protected uncompetitive markets, especially by America and Europe, and at the beginning of 2008 show little or no progress.

12.2.4.2 Agricultural subsidies

Annual subsidies amounting to US\$ 300 billion to the Organization for Economic Cooperation and Development (OECD) agriculture are equal to Sub-Saharan Africa’s GDP (World Bank, 2000). The United Nations Economic Commission for Africa (ECA) (2003) and Hassett and Shapiro (2003) estimated in 2001, that developed countries paid their farmers subsidies amounting to US\$ 311 billion, as

much as Sub-Saharan Africa's entire economic output (Hassett & Shapiro, 2003). Similarly, it is estimated that the total value of agricultural subsidies in developed countries (OECD) is almost US\$ 1 billion/day. Annually, this is more than the GDP of Sub-Saharan Africa (Legum, 2002; Sharma, 2002; Guest, 2004; Commission for Africa, 2005) which was US\$ 303.5 billion in 2002 (UNDP, 2004) and US\$ 279 billion/year by 2005/6 – over three times the value of global aid to developing countries (Offenheiser, 2006). As subsidies continue to rise, the Commission for Africa (2005) estimates agricultural subsidies in developed countries amounted to US\$ 350 billion in 2003.

"Of this, US\$ 257 billion was support to producers and US\$ 52 billion was support to R&D,⁴⁶² training, marketing and promotion. Most support to producers is provided through market barriers that keep prices artificially high – some US\$ 160 billion – as opposed to the US\$ 97 billion paid directly to producers. The EU, U.S., and Japan account for 90% of total OECD support, and the bulk of this support is for milk, meats, grains and sugar. This support is 16 times OECD aid to Africa (US\$ 22 billion in 2002)" (Commission for Africa, 2005).

UNDP (2004) estimates Official Development Assistance (ODA) to Sub-Saharan Africa was US\$ 17.2 billion in 2002 (see Chapter 11, Table 11.4, Official 2002 development assistance (ODA = foreign aid) as a percentage of all investment inflows to Sub-Saharan).

The OECD has a method of measuring market protection in a given member state called "Producer Subsidy Equivalent/Producer Support Estimate (PSE)". PSE is

"a broadly defined Aggregate Measure of Support (AMS) to agriculture that combines into one total value aggregate, direct payments to producers financed by budgetary outlays (such as

⁴⁶² Research and Development.

deficiency payments), budgetary outlays for certain other programs assumed to provide benefits to agriculture (such as research and inspection and environmental programs), and the estimated value of revenue transfers from consumers to producers as a result of policies that distort market prices" (USDA, 2003) or "the monetary value of transfers (direct and indirect) from consumers and taxpayers to producers" (OECD, 2005).

Expressed as a percentage, the %PSE provides an indication of how much of a farmer's earnings are from government support/interference, this percentage being paid either directly or indirectly by government and/or by increased costs to the consumer (e.g., in a protected market).

"The %PSE, accounted for 32% of farm receipts, a slight increase from 2002, but down from 37% in 1986-88. The PSE in 2003 is estimated at \$US 257 billion, or EUR 229 billion...Support to producers in 2001-03 was below 5% of farm receipts in Australia and New Zealand, 20% or less in Canada, Mexico, Poland, Slovakia, Turkey and the United States, around 25% in the Czech Republic and Hungary, 35% in the European Union (EU), and 60% or more in Iceland, Japan, Korea, Norway and Switzerland" (OECD, 2004).

Similarly, "The EU is the largest protector of agriculture in the world. The EU also accounts for 90% of OECD export subsidies in agriculture. Gross support from consumers and taxpayers to farmers constitutes only 2% of farm receipts in New Zealand, but around 20% in the U.S. and Canada, 35% in the EU, and 58% in Japan. Japan spends 1.4% of GDP on agricultural support, the EU 1.3%, and the US 0.9%" (Commission for Africa, 2005),

these costs being passed on to the consumer through higher food costs and taxes. Percent PSE for key commodities in 2003 for the OECD as a whole include: wheat/37%, maize/21%, rice/74%, sugar/56%, milk/49%, beef and veal/35%, sheep/42% and all commodities/32% (OECD, 2004).

In 2004, the Total Support Estimate (TSE), an OECD indicator of the annual monetary value of all gross transfers from taxpayers and consumers arising from policy measures to agriculture in OECD countries, amounted to about US\$ 378 billion (EURO 305 billion), the United States accounting for about US\$ 109 billion (29%), the European Union (EU) for about US\$ 151 billion (40%), and Japan for a little less than US\$ 61 billion (16%). Of the US\$ 378 billion, about US\$ 280 billion was paid by OECD countries in support (Producer Support Estimate) to farmers (leaving out general services [about US\$ 65.8 billion] and consumer subsidies [about US\$ 32.6 billion]), the U.S. transferring US\$ 46.5 billion, the EU - US\$ 133.4 billion and Japan - US\$ 48.7 billion. These three were responsible for 85% of the TSE and 82% of the PSE in OECD countries. The level of producer support in the OECD as a whole, as measured by the %PSE, is estimated at 30% in 2004, the same level as in 2003 (OECD, 2005).

In general, subsidies, tariffs and quotas increase costs to OECD consumers, keep prices artificially elevated and result in flooding of world markets dropping global commodity prices. While the OECD is supposed to be helping Sub-Saharan Africa develop economically and improve its agricultural production through foreign aid and technical assistance, it is simultaneously creating commodity shocks through its policies (Commission for Africa, 2005).

Subsidies lower global prices by encouraging over-production, some of which, in the case of food, is dumped on poor developing countries (see Chapter 11, Section 11.8, FOOD AID). “These subsidies are crippling Africa's chance to export its way out of poverty,” said James Wolfensohn, the World Bank president (Kristof, 2002). These issues have to be addressed in the World Trade Organization (WTO). There is increasing concern that subsidies should be removed in developed countries (UNECA, 2003).

In July 2004, there appears to have been a breakthrough in WTO negotiations to reopen free-trade talks known as the DOHA⁴⁶³ development round, which would eliminate export subsidies and reduce domestic subsidies, improving agricultural trade. The U.S. will “fast track” cotton subsidies (Schlein, 2004). According to Bello and Kwa (2004), the African cotton producing countries failed to get the U.S. cotton subsidies fast tracked or a commitment to have them eliminated. According to SouthAfrica.info (2004), the July, 2004 WTO agreement will result in the West opening its markets to African agricultural products in return for Africa cutting duties on industrial goods.

“The EU, the United States and countries such as Japan and Switzerland set greater access to markets for industrial goods in developing countries as the price for farm subsidy cuts” (Waddington & Lannin, 2004).

Are we not back to square one; Africa continuing to export raw products and import transformed ones? It also appears that the reduction in export subsidies would not be before 2015-2017 (Global South, 2004). A specific end-date to export subsidies will only be achieved in the next round of negotiations (Bello & Kwa, 2004). In early 2008, these issues have still not been resolved.

⁴⁶³ Doha, Qatar where periodic WTO ministerial conferences have taken place.

Hiding Domestic Trade and Production Subsidies, Green, Blue and Amber Boxes

There are many games being played with domestic trade and production subsidies under the following categories:

- **Green Box** (no, or minimally trade distorting support).
- **Blue Box** (domestic support linked to limits on production and exempted from spending limit).
- **Amber Box** (all government spending in this box, unless it qualifies for Blue or Green Box) - trade distorting support. This includes market price support, direct payments and input subsidies.

The 'Green Box' covers subsidies that are expected to cause minimal or no trade distortions. Such subsidies have to be publicly funded but must not involve price support. In simple words, it includes direct income support to European, American and Japanese farmers, which is formally decoupled from production levels and prices. 'Green Box' also includes subsidies granted in the name of environment protection and preservation, and for agricultural research and development. In reality, these subsidies are termed 'non-trade distorting' because of the ability of only the rich countries to provide for such support. Knowing that the developing countries do not have the financial resources to pose any threat to the protection provided through 'Green Box' (Sharma, 2004a).

There is concern that developed countries will cut subsidies in some areas and then move them into the "Green Box".

“Developing countries need to worry about the ‘Green Box’ subsidies because it actually operates like ‘income insurance’ scheme for the farmers in the industrialized countries. They remain insulated from the volatility of the global markets. Whether the international prices slump or go on a meteoritic rise, they remain unruffled, as their life style has already been protected by the state subsidies” (Sharma, 2004a).

Even when direct export subsidies are eliminated, indirect export subsidies can be provided under the “Green Box”. The “Green Box” houses up to 70% of the U.S. subsidies and remains untouched. Some maintain that after the dust settles, the EU and USA subsidies will remain the same and/or increase (Bello & Kwa, 2004). Sharma (2004a) recommends that the G-20 nations (basically many of the developing countries, led by Brazil and India) push to have all “Green Box” subsidies eliminated.

With regards to the Blue Box, The United States and the EU proposed that the definition be amended to include direct payments based on fixed areas and yields, and in reference to past production (BNA, 2004 & USDA, 2003), a fixed number of head of livestock, or if they are made on 85% or less base level of production (USDA, 2003). At the July, 2004 WTO talks in Geneva, the U.S. scored the biggest gain in an expanded “Blue Box” in which to house a considerable portion of the subsidies to its farmers legislated under the U.S. Farm Bill of 2002 (Bello & Kwa, 2004). Sharma (2004b) suggests that developed counties will now hide Green and Amber Box subsidies under the Blue Box – smoke and mirrors. In the

“case of cotton, an enlarged Blue Box could help to maintain huge levels of U.S. subsidies, contradicting the verdict of the recent WTO panel, which called for the elimination of most U.S. domestic support for cotton because of its damaging effects on other WTO members” (OXFAM, 2004a).

South Africa may be one of the few African countries supporting its farmers. The %PSE in 1998 was only 4.18 and this is a major decline from the %PSE of 12.5 in 1995, indicating a continuous decline in government and market support to agriculture. However, certain agricultural commodities were highly subsidized; wheat with a %PSE of 19.44, sugar/39.55, mutton/49.28, wool/14.97, dairy/20.92, beef and veal/21.20 for the year 1998. Many of the %PSEs for South Africa are very negative. “Negative PSEs imply that low world prices (as a result of distortive policies of OECD countries) indirectly tax South African producers” (Kirsten, Gouse, Tregurtha, Vink & Tswai, 2000).

Special Safeguard Measures (SSG)

Many developed countries also take advantage of protecting sensitive products under a special category of Special Safeguard Measures (SSG). Crucial commodities can be declared as sensitive and thereby be denied market access, a form of quota setting. For instance, the United States, the EU, Japan and Canada maintain tariff peaks of 350 to 900% on food products such as sugar, rice, dairy products, meat, fruits, vegetables and fish. Canada reserves the right to use SSG for 150 tariff lines, the EU for 539 tariff lines, Japan for 121 tariff lines, the United States for 189 tariff lines and Switzerland for 961 (Sharma, 2004b). Bello and Kwa (2004) and Sharma (2004b) estimate that the developed countries will use the category of “sensitive products” to protect some 20-40% of their products from significant tariff cuts.

Sharma (2004b) explains why the apparent proposition over these protective measures was agreed on by the G-20. Just before the WTO meeting, the United States announced on July 23rd, 2004, a sugar quota for 40 countries to export a fixed amount to the USA, including amongst the biggest quotas: Dominican Republic (185,335 metric tons), followed by Brazil (152,691 metric tons),

Philippines (142,160), Australia (87,402), Guatemala (50,546) and Argentina (45,281). The EU withdrew the equivalent of US\$ 60.2 million in foreign aid to Kenya on July 21st under the auspices of bad governance, just before the WTO meeting. Sharma (2004b) implies that many countries were, in essence, bought off. Kenya was the most vocal of countries that staged the walkout at the September 2003 WTO meeting in Cancun. “The terror of trade does not operate on ethics or morality” (Sharma, 2004b). London acknowledged it was using its influence to persuade developing countries (Sharma, 2004b).

“Despite the World Bank repeatedly painting a rosy picture of the gains that would result from the implementation of the WTO trade agenda, the fact remains surging food imports have hit farm incomes and had severe employment effects in many developing countries. Unable to compete with cheap food imports, and in the absence of any adequate protection measures...” (Sharma, 2004b). As Sharma (2004b) puts it, “any move to significantly cut agricultural subsidies will be political suicide for rich countries”.

Since the July 2004 WTO agreement, even in relatively developed South Africa in mid-2004, sophisticated commercial wheat farmers are suffering from wheat that can be imported cheaper from the USA than they can produce in-country. Likewise, South African farmers and agro-industries are suffering from food aid (see Chapter 11, Section 11.8.8, Food Aid and Impacts on Grain Production in Southern Africa), which is, in reality, another way of food dumping from the West linked to agricultural subsidies.

The reality of how much the West will concede with regard to its protected markets will come out between August 2004 and December 2005 at the next ministerial meeting in Hong Kong (Schlein, 2004). UNECA (2004) states that

“not only do the OECD countries seem reluctant to reduce the export subsidies for their own agricultural products, but the dismantling of domestic farm support measures (e.g., the EU’s

Common Agricultural Policy (CAP), U.S. cotton subsidies) is also currently politically untenable for most of the northern countries”.

This is still the case in early 2008.

America's Agricultural Subsidies

Rosenblum & Williamson (1987) estimated that U.S. farm subsidies were US\$ 25 billion/year in the mid-1980s, while foreign aid to Africa was US\$ 600 million, with twice this amount (US\$ 1.2 billion) going to Israel and Egypt (see Chapter 11, Section 11.7.1.1, Overseas Development Assistance (ODA) versus Overseas Assistance (OA), U.S. Foreign Assistance). The Commission for Africa (2005) estimates that

“the U.S. Farm Bill in 2002 institutionalized emergency support to U.S. farmers – with a 10-year value of \$US 190 billion, an increase of \$US 83 billion over previous programs. There are also stronger links between subsidies and production decisions. This approach leads to oversupply and dumping of agricultural produce; U.S. policy on cotton is one extreme example of the harm this can cause to poor people in Africa”.

Between 1994 and 2004, subsidies to U.S. farmers totaled US\$ 140 billion, US\$ 20 billion in 2005, 93% for corn, cotton, wheat, rice and soybean (Redline & Kline, 2007). Export credits, a form of welfare, under the 2002 U.S. Farm Bill amount to US\$ 5.5 billion that according to WTO agreements, should be eliminated (Commission for Africa, 2005), but as discussed above, will likely be hidden.

The massive increase in agricultural production, especially in the American West over the last century, is due to massive government subsidies (see Chapter 7, Section 7.1, BIG DAM ERA IN THE WESTERN UNITED STATES).

“The disaster Powell⁴⁶⁴ predicted – a catastrophic return to a cycle of drought – did indeed occur, not once but twice: in the late 1800s and again in the 1930s. When that happened, Powell’s ideas – at least his insistence that a federal irrigation program was the only salvation of the arid West – were embraced....The result was a half-century rampage of dam-building and irrigation...But even as the myth of the welcoming, bountiful West was shattered, the myth of the independent yeoman farmer remained intact. With huge dams built at public expense, and irrigation canals, and the water sold for a quarter of a cent per ton – a price which guaranteed that little of the public’s investment would ever be paid back – the West’s yeoman farmer became the embodiment of the welfare state though he was the last to recognize it” (Reisner, 1986).

In America, subsidies on cotton, sugar, dairy products and corn exacerbate Africa’s problems (Hassett & Shapiro, 2003),

“Dollar for dollar, America exports more meat than steel, more corn than cosmetics, more wheat than coal, more bakery products than motorboats, and more fruits and vegetables than household appliances. Agriculture is one of the few sectors of the U.S. economy that consistently contributes a surplus to its trade balance. U.S. projections for the current year (2002) are that 53% of its wheat crop, 47% of cotton, 42% of rice, 35% of soybeans, and 21% of corn will be exported. This has only been made possible by the heavy subsidies and the removal of trade barriers or Quantitative Restrictions (QRs) in the developing countries”.

In 2002, the White House and Congress are trumpeting their determination to bring economic opportunity to the people of Africa. The Bush administration has been busy extending special trade status to African exporters. There has even been talk of a “Marshall Plan” for Africa. However, all of those initiatives added together may not be enough to offset the damage inflicted on Africa’s small farmers by the \$190-billion (over ten years) agriculture bill that President Bush signed into law. This will put millions of small farmers out of business in Africa,

⁴⁶⁴ John Wesley Powell, famous for being the first to run the mighty Colorado River.

said Mark Ritchie, president of the Institute for Agriculture and Trade Policy in Minneapolis (Vieth, 2002).

“ ‘Commodity prices will probably sink lower on a global basis. For countries that do not subsidize their farmers as well as we do, that will mean economic and financial trauma,’ said Neil Harl, director of the Center for International Agricultural Finance at Iowa State University. ‘We’re making decisions here in the U.S. that affect the entire world, yet the rest of the world doesn’t have much say in what our policy is’ ” (Vieth, 2002).

The adoption of the U.S. “Farm Security and Rural Investment Act, 2002” is a case in point. A recent review indicated that the Bill (NEPAD, 2002):

- “offers support to a declared maximum of \$US 360 000;⁴⁶⁵
- raises spending on U.S. farm subsidies by some 70% (\$US 15-20 billion/year). This is already more than Africa’s total annual agricultural exports;
- offers fixed payments each year for each eligible crop (including a number of crops currently or potentially important to Africa: cotton, rice, peanuts, other oil seeds, maize, sugar, soybean, sorghum);
- lowers loan rates and in case of low market prices, could offer direct subsidies;
- gives counter-cyclical payments when farm income falls below threshold levels (payments to offset a drop in previous prices);
- dairy farmers can receive 45% (up to a cap) of the difference from a target price specified in the bill;
- sugar continues to be heavily protected against imports;
- new supports are offered for wool, mohair, honey, chick peas and lentils;
- apples, fruit and vegetables are subsidized and their purchase and distribution is also supported”.

⁴⁶⁵ It is believed this is per farmer over a six year period based on the U.S. Farm Bill 2002 (Mitra, 2002).

Money from the agricultural bill will finance a variety of farm programs, from agricultural research to conservation programs. However, much of it, an estimated \$57 billion, will be paid directly to farmers to make up for low commodity prices. The biggest subsidies are earmarked for producers of wheat, corn, sorghum, barley, oats, rice and cotton. According to the Paris-based Organization for Economic Cooperation and Development (OECD), which monitors fiscal policies in industrialized countries, farm subsidies already are distorting the economics of agriculture in the United States. Of every US\$ 1 in U.S. farm revenue, about 25 cents comes from the government. In 2000, government support averaged \$20,800 per farmer (Vieth, 2002).

“Some of those crops are among the major agricultural products of Sub-Saharan Africa--where farm production accounts for an average of 17% of the total economic activity in 48 nations. The farm bill's negative impact on the developing world will eclipse the potential benefits of Bush's proposed Millennium Challenge Account, which would provide poor countries with \$10 billion in additional development aid over three years” (Vieth, 2002).

Impacts of U.S. Subsidies and Globalization on South African Maize Production.

For instance, the international maize market, especially the U.S. market, has a dominant influence on maize prices (Nieuwoudt & Groenewald, 2003), international soybean and grain prices being highly influenced by the Chicago Board of Trade (Areddy, 2005). This forces South African maize farmers to compete on a global market against highly subsidized American farmers. It then becomes cheaper to ship maize in from the U.S. than to grow it in South Africa under “free-market” conditions. Many are concerned that if trends continue, the decreased profitability of maize farming could put many farmers out of business and/or force them to switch to more valuable crops, jeopardizing South Africa’s ability to feed itself and much of southern Africa. Given the loss of southern

Africa's other breadbasket, Zimbabwe, this threat must be taken seriously. An estimated 9,000 commercial maize farmers employ 150,000 farm workers plus a vigorous secondary industry producing staple food for millions of households (NAMM, 2005) or about 18% of the 814,000 people employed in the agriculture/hunting/forestry/fishing sector out of an estimated South African national workforce of 9.1 million based on a 1996 census (Nieuwoudt & Groenewald, 2003).

"The maize value chain is the core business of many input suppliers (e.g. fertilizer, chemical, seed, fuel, machinery and logistic companies), service providing companies (e.g. agribusinesses, marketing and storage companies) and financial institutions (e.g. the Land and other commercial Banks)" (NAMM, 2005).

In the past year, white maize prices in South African declined by nearly 47%, at their lowest levels since August 2000. The drastic decline in domestic maize prices can be mainly attributed to (NAMM, 2005):

- A sharp decline in international maize prices. A record subsidized maize crop in the U.S. caused international maize prices to decrease from US\$ 134/ton in April 2004 to US\$ 96/ton in April 2005, a 28% decline;
- The appreciation of the Rand/USA Dollar exchange rate. The Rand strengthens from R6.76 per USA Dollar in February 2004 to R6.01 per USA Dollar in February 2005, an appreciation of 11%, which caused the producers to loose a lot of money, since the prices are dollar-based;
- An increased cost of farm inputs, since the prices of crude oil and natural gases caused international prices of fuel and chemicals to rocket (e.g., fuel, fertilizer, etc.); and
- An over supply of maize on the domestic maize market, with human demand declining over time due to HIV/AIDs.

“The situation of increasing input prices and historical low maize producer prices have started to raise question regarding the profitability of maize production since the situation affects producers’ ability to repay their loans. The value of farmland is also closely related to the value of the product. In the case of maize production the value of farmland follows the maize price. Lower farmland value severely affects the solvability of maize producers, which affect the security value of the farmers at financiers and could lead to lower facilities at financial institutions. Emerging maize producers do not have the benefit of economics of scale in the domestic maize market as commercial producers have, which make them more financial vulnerable, given the current situation of maize producers. Most emergent farmers are entirely dependent on outside financing, making their current financial position worst. The current low maize prices and low profitability of the maize producers will make it nearly impossible for financiers to finance emerging farmers. This will hamper the transformation in the maize industry” (NAMM, 2005).

Europe's Agricultural Subsidies

Subsidies amount to about US\$ 17,000/year for each EU farmer (Legum, 2002).

Pascal Lamy, the French E.U. Trade Commissioner, explained (Legum, 2002), “ ‘The EU has taken a deliberate decision to keep its farmers on the land, whether or not they are internationally competitive...If we are fully competitive, employment in the farm sector will drop from 7 million farmers to just one million. This is politically unacceptable.’ ”

As in the United States, according to IFPRI (2003), the biggest 25% of EU subsidy recipients receive more than 60% of all subsidies. The question is whether market rules should apply to everything. Important to EU decision-makers is rural life, landscape and environment. These justify the continuation of its costly and inefficient farming strategy (Roman, 2003).

Africa is particularly vulnerable to EU farm subsidies because proximity and decades of colonial and post-colonial relations make Europe and Africa efficient trading partners. As the result of the Common Agricultural Policy (CAP), while the average person in Sub-Saharan Africa earns less than US\$ 1/day, a European Cow earns US\$ 2/day as a result of subsidies (OXFAM, 2002b; Hassett & Shapiro, 2003 & Commission for Africa, 2005). A growing volume of literature argues that the largest factors stunting African economic development include not only disease, drought, warfare and mismanagement, but also the European Union (EU)'s Common Agricultural Policy (CAP). These subsidies reward European farms to produce more, while dumping this excess in the Third World, depressing world food prices, while putting protective tariffs on food exported from Africa (OXFAM, 2002b; Hassett & Shapiro, 2003). Tariff peaks still persist in several products (e.g., sugar, meat and horticultural products) and tariff escalation (higher tariff on more processed products which are given greater protection to the processing industry of the importing country) still prevails in several important product chains (e.g. coffee, cocoa, oilseeds, vegetable, fruit and nuts, and hides and skins) (NEPAD, 2002).

Currently, the CAP consumes 40 billion Euros annually, about half of the EU budget. The CAP sets price guarantees far higher than world prices or production costs. To assure that they are not under-cut abroad, European farmers, like U.S. farmers, receive hefty export subsidies to add to their domestic profits. Politicians seeking election then call on their “partners” for financial support. Thus, large agribusinesses thrive on government largess at the expense of the world’s most vulnerable people. This injustice is maintained because politicians receive their share of the profits (OXFAM, 2002b; Hassett & Shapiro, 2003).

Population density, weather and the cost of capital and labor make the EU an inefficient dairy producer, cost of production being on average twice as high as

international prices. Yet Europe accounts for 40% of the world's exports of whole milk powder and 33% of world cheese exports. Europeans may think that these subsidies go to quaint dairy farms dotting the French and Dutch countryside, but in reality, most of these subsidies go to multi-national agribusinesses such as Aria Foods and Nestlé (Hassett & Shapiro, 2003).

EU subsidies for sugar have an even worse impact on the tropics, including Africa. Sugar cane farmers in the tropics can produce more than twice as much as rivals in cooler climates growing sugar beets. In addition, land prices, wages and other production factors in tropical countries are a small fraction of what they are in the European countries. Yet the EU, with the world's highest sugar production costs, is the world's largest sugar exporter. EU farmers receive guaranteed prices for sugar even if it sells overseas at a lesser price, while in Europe sugar is sold at high prices. CAP tariffs of 140% keep foreign sugar off the EU market. Single large firms account for the entire domestic production for sales and production in at least eight European countries, with little or no impact on the small producer. Meanwhile, price guarantees and export subsidies enable EU producers, some as far north as Finland, to claim a significant share of the sugar market, even in tropical Africa. Joseph Daul, chairman of the EU parliament's agriculture and rural development committee, which must approve any sugar subsidy reform, is himself a major French sugar beet farmer (Hassett & Shapiro, 2003).

Due to subsidies, Europe is the world's largest exporter of white sugar, pushing more efficient producers in countries such as Malawi and Zambia out of regional markets. The same CAP restricts the entry of African sugar into EU markets. Mozambique, where 70% of the rural population lives below the poverty line, loses US\$ 100 million a year from EU subsidies. Like the U.S., the EU uses Africa as a dumping ground for surpluses. Everything from milk to wheat is sold at "giveaway" prices, destroying the markets on which small farmers depend. By

undermining local self-reliance, dumping, linked to subsidies by rich countries in Africa, is helping to create conditions for famine. In February 2003 at a summit of African leaders in Paris, President Chirac called for a moratorium on agricultural dumping in Africa (Palmer & Kline, 2003).

In 2004, challenged by Brazil, the WTO ruled that the EU is violating its commitments to the WTO by exporting up to 4 times more subsidized sugar onto world markets than is allowed (OXFAM, 2004b)

A recent study by the Institute of Economic Affairs in Britain estimates that EU agricultural policies have reduced African exports of:

- Milk by 90%;
- Livestock by 70%;
- Meat by 60%;
- Non-grain crops by 60%; and
- Grains by 40%.

They estimate that the CAP reduces Africa's potential export of agricultural products by half (50%). They estimate that without the CAP, the current US\$ 10.9 billion in annual food related exports from Sub-Saharan Africa (excluding South Africa) could grow to nearly US\$ 22 billion/year. The Washington-based Food Policy Research Institute (IFPRI) found in Sub-Saharan Africa that every US\$ 1 in agricultural income produces US\$ 1.42 in GDP⁴⁶⁶. Getting rid of CAP

⁴⁶⁶ Gross Domestic Product (GDP) is the market value of new goods and services produced by the input factors (capital and labor) located within the geographic boundaries of an economy. Gross National Product (GNP) allocates product according to the "nationality" of the owners of the factors. Gross Domestic Product (GDP) allocates product according to the "location" of the owners of the factors. $GDP = GNP - \text{Net Factor Payments (NFP)}$. NFP is the net income paid to domestically located factors by foreign owned factors.

could raise the GDP by US\$ 26.4 billion/year, increasing annual per capita incomes by 13% on the subcontinent (Hassett & Shapiro, 2003).

Agricultural Subsidies and Support in Europe and U.S. to Large, Not Small Farmers

The general trend, as noted in Europe but also in the U.S., is for subsidies and support to go mostly to the largest farmers, often corporate farms, not the small farmer. The Commission for Africa (2005) estimates that

“only 4% of EU support goes to 25% of the smallest farms, roughly the same in the U.S. with the largest 25% of the farms receiving over 70% of the support, reaching 80% in the U.S....It is estimated that a move to free-trade in sugar would raise world prices by something close to 40%, and could generate around US\$ 4.7 billion in welfare gains for the developing countries”.

According to IFPRI (2003), in the U.S. 60% of farmers get no support at all, while the biggest 7% account for 50% of government payments. Large corporate farms, making up 17% of the farms given subsidies, received 56% of total subsidy payments (Redline & Kline, 2007).

12.2.4.3 Tanzania and U.S./EU farm subsidies

“Northern import restrictions and production subsidies help to explain two features of the world agricultural trading system left intact under globalization: slow growth and continued domination by industrialized countries” (IFPRI, 2003).

Strolling around supermarkets in Dar es Salaam, it is easier to find boxes of orange juice from Dubai, lines of canned beef from the UK and butter and cheese from as far away as New Zealand than it is to find local produce. Because of these subsidies, Shoprite (a South African supermarket in Tanzania) will find it

easier to import something than to buy it locally. According to UN figures, approximately five million people are involved in cotton production in Tanzania, but for the last few years, the industry has remained idle because of heavy cotton subsidies (50%) in the United States. If the prices are bad, the private sector will not buy from the farmer. This has resulted in two or three successive years of the cotton being left in the fields without being bought, greatly affecting the farmers' livelihoods. Removing subsidies in the U.S. or the European Union (EU) is not a question of making people richer, but rather improving the living standards of rural populations, which account for some 85% of Tanzania's 31 million people and 350 million people across Sub-Saharan Africa. The impact of subsidies is far bigger than the small amount of foreign aid that this country is receiving. If people are going to talk about sustainable development, then they should get rid of subsidies (United Nations, 2002).

12.2.4.4 Cotton subsidies and protected markets

Africa's Comparative Advantage in Growing Cotton

Two advantages Africa has over the rest of the World for growing cotton are long growing seasons and low humidity. Cotton requires at least 200 days of relatively high temperatures. Temperatures below 20° C inhibit plant growth, especially during flowering and maturation of the boll. It grows best when the average temperature is 25° C. Cotton is drought tolerant and can grow well even in areas with rainfall under 500 mm/year, though higher rainfalls are preferred to assure economic yields of fiber. On the other hand, high humidity during maturation and the pre-harvesting period may result in the bolls rotting (Theron, 1977).

The downside is that cotton takes up tremendous amounts of nutrients in the soils, requiring mitigation by crop rotation with leguminous plants to replace nitrogen and control nematodes, and fertilizer additions based on laboratory testing of soils (Table 12.1).

Table 12.1: Nutrient removal from the soil by the cotton plant

<u>Yield Cotton/Seed (kg/ha)</u>	<u>Nitrogen (N) Removal By Cotton Plant (kg/ha)</u>	<u>Phosphorous (P) Removal By The Cotton Plant (kg/ha)</u>	<u>Potassium (K) Removal By The Cotton Plant (kg/ha)</u>	<u>Reference</u>

Source: Prepared by Authors

Analysis of petiole and leaf samples one week after the first flowers occur is recommended for testing to determine if there are micro-nutrient deficiencies (ARC⁴⁶⁷, 1996) such as boron (B), zinc (Zn), calcium (Ca.) and magnesium (Mg). Calcium deficiency can result in a shedding of bolls (Tobacco and Cotton Research Institute⁴⁶⁸, 1990). Soil pH is also critical, with the optimum range of 6.0-7.5. If the soil pH is too low, the uptake of certain nutrients will be negatively affected. Depending on the calcium/magnesium ratio in the soil, calcitic or dolomitic agricultural lime can be added to the soil to raise the pH (Tobacco and Cotton Research Institute, 1990). Failure to take these precautions can result in soil mining. Pesticides are also a requirement, although new pest resistant cultivars are being developed by groups like Monsanto, such as the stacked gene

⁴⁶⁷ Agricultural Research Council (ARC) of South Africa, 1134 Park Street, Hatfield, Pretoria, P.O. Box 8783, Pretoria, 0001, Tel: 27-12-427-9700, Fax: 27-12-342-3984, www.arc.agric.za.

for “Bt” which controls the bore worm and a gene which makes the cotton plant resistant to the herbicide, RoundUp, used to control weeds in cotton fields (Hagedorn, *pers. comm.*).⁴⁶⁹ Cotton SA⁴⁷⁰ believes that this GM cultivar consisting of “stacked genes” will allow country’s like South Africa to double production (Louw, *pers. comm.*)⁴⁷¹, while others have raised a “red flag” (see Chapter 5, Section 5.12.1.2, Green revolution technologies - Green Revolution, South Africa).

U.S. Cotton Subsidies and Africa, Cultivating Poverty

As a result of the U.S. Farm Bill of 2002,

“the resulting loss of cotton exports amounts to 3% of the total economic output of Mali and Benin, the IMF said, and 1% to 2% for Burkina Faso and Chad. The damage exceeds the total value of the relief provided to those countries under a global debt relief initiative financed by wealthy nations and administered by the World Bank” (Vieth, 2002).

On the other hand,

“the World Bank estimates that the removal of protection and support in the cotton sector would increase prices by 13% over the next 10 years and world trade in cotton by 6%. Africa’s cotton exports would increase by 13%” (ILO, 2004).

There are 11 countries in Africa where cotton accounts for more than one-quarter (25%) of the export revenue, rising to one-half (50%) for Benin and two-thirds (67%) for Burkina Faso. These exports are a vital source of foreign exchange,

⁴⁶⁹ Hagedorn, E.W., Department of Agriculture, Tshwane University of Technology, Pretoria, South Africa

⁴⁷⁰ Cotton SA, P.O. Box 912 232 Silverton, Republic of South Africa, <http://cottonsa.org.za>.

financing essential imports such as food, fuel and new technologies. They also underpin government revenues, providing the funds needed to invest in health and education. A study of Sub-Saharan Africa carried out by the World Health Organization, found that households growing cotton and maize had better nutrition and higher income than households growing maize alone. Production was given a major boost by CFA devaluation in 1994, a move that enhanced export competitiveness and increased local prices. However, health risks and environmental pollution, caused by high pesticide and fertilizer use, have been overlooked. There are also inherent dangers in reinforcing dependence on a single crop, for which global markets are highly volatile (OXFAM, 2002a). There are however, other downsides to the CFA devaluation on the environment (see Chapter 11, Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the “Dobi Dobi”, More Parks and Protected Areas).

In 2001/2002, America’s 25,000 cotton farmers received \$3.4 billion a year in subsidies, double the level in 1992 (OXFAM, 2002a; IFPRI, 2003; Palmer & Kline, 2003) for a crop valued at only US\$ 3 billion (Hayes, 2004). This increase in subsidies is a breach of the “Peace Clause”⁴⁷² in the WTO Agreement on Agriculture (OXFAM, 2002a). Under the 2002 U.S. Farm Bill, cotton farmers will receive a guaranteed price of around US\$ 1.14/kg (52 cents per pound), regardless of what happens to world market prices (which are currently 19% below that level). In addition, farmers will receive a further set of payments to top up their income to a target price level. The result will be that they will receive a price some 73% above world market levels (OXFAM, 2002a).

⁴⁷² Expired December 31, 2003 (OXFAM, 2004a). It is unclear if this was renewed or not.

The nearly US\$ 4 billion (OXFAM, 2002a) to US\$ 3-4 billion (Kousari, 2004) in subsidies received by 25,000 of America's cotton farmers in 2001/2002 year is:

- **Greater than the GNP (GNI)⁴⁷³ of many Sub-Saharan African countries (OXFAM, 2002A).**
- **More in subsidies than the entire GDP of Burkina Faso** – a country in which more than two million people depend on cotton production. Over half of these farmers live below the poverty line. Poverty levels among recipients of cotton subsidies in the US are zero (OXFAM, 2002a).
- **Negative to Mali, which received US\$ 37 million in foreign aid from USAID in 2001, but lost US\$ 42 million due to U.S./EU cotton subsidies (OXFAM, 2002a).** Mali is Africa's largest cotton producer, with an output of 600,000 tons in 2003, yet without a textile industry, processes only 1% of its cotton consumption. Millions of Malian farmers with 2 ha (5 acres) of cotton live on less than US\$ 1/day, while American farmers average about 405 ha (1,000 acres) (Dizolele, 2004).
- **Three times more in subsidies than the entire USAID budget for Sub-Saharan Africa's 500 million people (OXFAM, 2002a; Palmer & Kline, 2003; OXFAM 2004c).** Note – latest African population – 622-650 million in 2000 (see Chapter 5, Section 5.9, OVER-POPULATION, SOIL DEGRADATION AND DECLINING AGRICULTURAL PRODUCTIVITY).

The World Economic Forum (2004) estimates that cotton subsidies by the West shave about 10% from cotton prices, depriving poor African farmers of valuable income.

⁴⁷³ See Footnote 48, Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA.

“Removal of U.S. and EU cotton support is estimated to increase Sub-Saharan Africa cotton exports by 75%. African farmers are much more competitive than their U.S. and EU counterparts, producing a pound of cotton for 21 cents in Burkina Faso, compared with 73 cents in the U.S”. (Commission for Africa, 2005).

OECD cotton subsidies negatively impact an estimated 10-11 million small farmers in West Africa (IFPRI, 2003; Kousari, 2004; Commission for Africa, 2005).

These subsidies create a huge disadvantage for resource-poor African farmers and a parallel unfair advantage for their American counterparts. By driving down prices, U.S. taxpayers and their European counterparts in other product groups, bear a direct responsibility for poverty in Africa (OXFAM, 2002a). For instance, in Benin where cotton accounts for 7% of GDP and 40% of exports, a percentage point increase in world cotton prices from reduced subsidies would reduce poverty by 1.5 percentage points (World Economic Forum, 2004). A 25% increase in the world price of cotton, roughly corresponding to the effect of the elimination of U.S. subsidies, would cause the national incidence of poverty in Benin to decline by 4% (IFPRI, 2003 & Kousari, 2004), enabling 250,000 people to rise above the poverty line (IFPRI, 2003).

The USA is not the only country subsidizing cotton. “The EU provides up to US\$ 1 billion in support to EU cotton production” (Commission for Africa, 2005).

While there are a large number of countries producing cotton, just four – China, the U.S., India and Pakistan, in descending order – account for 67% (two-thirds) of total production. Most cotton is consumed in the country that produces it. The major exception to this rule is the United States. In a typical year, more than half of U.S. cotton is exported. Over the longer-term, subsidies have enabled the U.S.

to expand its share of world cotton production (on a linear trend basis) from around 16% at the start of the 1990s to over 20% at the end of the decade. The upshot is that the U.S. is, by some margin, the world's largest exporter of cotton (OXFAM, 2002a).

Because the U.S. is the world's largest exporter of cotton (OXFAM, 2002a; Palmer & Kline, 2003), accounting for 40% of the world market (IFPRI, 2003), these subsidies push down world prices, which have fallen by half since the mid-1990s (OXFAM, 2002a; Palmer & Kline, 2003). Adjusted for inflation, average prices for cotton are lower than at any time since the Great Depression of the 1930s, at just under US\$ 0.88/kg (US\$ 0.40/pound) in 2001/2002 versus a high of just over US\$ 1.98 /kg (US\$ 0.90 cents/pound) in 1995/96 (OXFAM, 2002a). OXFAM (2004c) estimates that U.S. dumping created losses of almost \$400 million for poor cotton-producing African countries between 2001 and 2003. The Commission for Africa (2005) estimates that

“U.S. support to its cotton farmers was \$US 3.9 billion in 2002, driving down world prices by 10-20%, with annual income losses in West African cotton producing countries estimated at \$US 250 million. This support is expected to stay at these levels for the next 6 years, ensuring that U.S. farmers get twice the current world price for cotton”.

Offenheiser (2006) estimates a loss of US\$ 200 million/year in income to ten million West African farmers due to US\$ 4 billion/year in U.S. government subsidies going to the 25,000 American cotton farmers. Basically, exports are going up, but countries are earning less.

The cotton subsidy program has also undermined the Heavily Indebted Poor Countries (HIPC) Initiative, costing countries such as Benin, Burkina Faso, Chad and Mali more than they have received in debt relief (OXFAM, 2002a). As an

example, the cost of lower cotton prices to Mali amounted to a loss of US\$ -43 million in 2001 (Kousari, 2002) to \$US -42 million (OXFAM, 2002a), exactly the amount of debt relief from the World Bank and the IMF in the same year, under the HIPC Initiative (Kousari, 2004). In 2001, lower cotton prices in Benin resulted in a 4% rise in poverty in 2001 (Kousari, 2004).

One major concern is that lower prices force desperate small farmers in already over-populated areas, such as Burkina Faso, to increase and/or maintain income levels by expanding production of cotton on marginal land, resulting in habitat degradation, and/or through the over-use of fertilizers and pesticides in attempting to increase production, resulting in soil and environmental degradation (OXFAM, 2002a). In Burkina Faso, soils have been so heavily mined of their nutrients that the extreme southern part of the country is the last area still suitable for cotton production (Pavy, *pers. comm.*). Ouattara (*pers. comm.*) from Banfora, southern Burkina Faso, explains that government provided fertilizer is available for cotton production, but it is inappropriate for the soils and actually contributes to soil degradation.

In the SADC region of Sub-Saharan Africa, (Louw, *pers. comm.*):

- 50,000 small Zimbabwe Farmers handpick and produce the least contaminated cotton in the world; and
- Two million small farmers grow handpicked cotton in Tanzania.

South Africa is the only country, as discussed in Chapter 5, where most cotton is produced by commercial farmers, although programs are underway by Cotton SA to increase production and the numbers of the currently 3,000 small farmers (Louw, *pers. comm.*) (see Chapter 5, Section 5.12.1.2, Green revolution technologies, Green Revolution, South Africa).

Africa's experience in cotton raises wider concerns about American policy. Through its aid program, the Bush Administration has sought to promote free-market reforms in Africa. Similarly, trade preferences under the African Growth and Opportunity Act (AGOA) are conditional on African governments liberalizing agricultural markets, including in the cotton sector. Yet when farmers in Mali or Burkina Faso enter world markets, they are forced to compete against heavily subsidized American exports.

"The result: farmers in poor countries earn far less for what they produce. Why does this matter for Africa? Because more than 10 million people in West Africa alone depend on cotton for cash to buy food and medicines, and to send their children to school. Lower prices mean more poverty in already desperately poor communities. Africa as a whole loses \$300 million a year as a direct result of US cotton subsidies" (Palmer & Kline, 2003).

Another concern is that a quarter of the world's pesticides are applied to cotton. There are risks of both environmental hazards and human health hazards (directly from contact while applying and indirectly from contaminating water supplies and the food chain) if farmers are not properly trained in its use (Madeley, 2002).

In 2004, in a landmark decision, the World Trade Organization (WTO) ruled in favor of Brazil's complaint that U.S. cotton subsidies distort world prices, violate global trade rules and price developing nations' goods out of markets (Clendenning, 2004a; 2004b; Hayes, 2004; OXFAM 2004b). The WTO panel found that (OXFAM, 2004c):

- U.S. cotton subsidies worth \$3.2 billion and export credits (for cotton and other commodities) worth \$1.6 billion, contravene WTO rules. This represents almost all cotton subsidies and close to 50% of all export credits used by the USA in 2002.

- The panel found that the USA used hidden export subsidies to circumvent its WTO commitment to reduce export subsidies. These subsidies are therefore, contrary to WTO rules and must be removed:
 - U.S. export credits for cotton, soybeans, corn, oilseed, oil products and rice, worth \$1.6 billion in 2002, constitute export subsidies.
 - The Step 2 Program,⁴⁷⁴ which amounted to \$415 million, constitutes an export subsidy rather than trade-distorting domestic support.

“Brazil's decision to take the issue to the WTO in February 2003 was the first challenge to the domestic farm policy of a rich country. The WTO interim ruling could lead to an avalanche of challenges against U.S., European and Japanese farm subsidies. It could weaken their defense of farm aid in the current Doha Round of global free-trade talks meant to wrap up this year...The cotton case could now encourage challenges to U.S. subsidies on goods such as soybeans, corn, wheat and rice...Brazil and the United States have until May 10 to respond to the decision before a final version is made public on June 18. The WTO then has up to three months to review any appeals” (Hayes, 2004).

Brazil's complaint to the World Trade Organization (WTO) about the U.S. cotton program constitutes “ ‘the most serious, full-frontal assault on the U.S. farm program in our history.’ ...the position of Sen. Pat Roberts, Republican from Kansas, according to his assistant legislative director and homeland security advisor, Mike Syfert... ‘The senator feels this case has the potential for impact not only to cotton, but wheat, maize, sugar cane, peanuts, sorghum, soybeans — everything,’ Syfert said at the joint meeting of the Cotton Foundation and the American Cotton Producers Association at Albuquerque, N.M”. (Brandon, 2004).

⁴⁷⁴ The Step 2 (subsidy) Program consists of two parts: it gives payments to bridge the difference between U.S. prices and the world market prices to exporters, as well as to domestic users of U.S. cotton (OXFAM, 2004c).

The U.S. appears to be continuing cotton subsidies in spite of the WTO ruling (Sharma, 2004b), possibly protected under the “Blue Box” or “Green Box” subsidy category (see Section 12.2.4, Agricultural Tariffs and Subsidies).

On October 18, 2004, The U.S. announced that it would appeal a World Trade Organization (WTO) ruling that had declared the majority of U.S. cotton subsidies illegal (OXFAM, 2004d). If the USA loses on appeal, it will be faced with a ruling that demands a deep reform of current subsidy programs. This could encourage a dangerous faction within the U.S. Congress, which is resisting WTO rulings on the principle of sovereignty. However, the USA would have a lot to lose if it were to refuse implementation, including (OXFAM, 2004c):

- **An overall reduction of the ambition of the Agreement on Agriculture** because developing countries and Cairns countries would conclude that the USA is not interested in reform.
- **A lost chance to reduce EU subsidies.** Given that the USA wants to discipline EU subsidies.
- **A lost opportunity to respond to demands made by West African countries to eliminate trade-distorting cotton subsidies.**
- **A weakening of the WTO and its Dispute Settlement Understanding** (DSU), the USA risking losing its ability to discipline practices of emerging markets such as India or China.

Offenheiser (2006) considered the December 2005 trade talks in Hong Kong as a “wasted opportunity for rich countries to deliver on development”, though there are slow movements in the right direction. The OECD countries agreed to end cotton export subsidies only by 2006 (Foster, 2005; Klug, 2005), though this must still pass the U.S. Congress where it is expected to receive stiff opposition (Blustein, 2005; Klug, 2005). “The U.S. is already obligated to eliminate export

subsidies for cotton under the Brazil-U.S. Cotton ruling...The commitment to cut domestic support on cotton was watered down from ‘will’ to ‘should’ ” (IATP, 2005). On December 21, 2005, the U.S. Congress voted US\$ 2.7 billion cuts in agricultural programs, a portion of this fulfilling U.S. obligation to terminate cotton export subsidies (Washington Post, 2005a). All export subsidies are to end by 2013.

By 2008, wealthy nations are to allow duty-free and quota-free-trade privileges for at least 97% of the products exported by the Least Developed Countries (LDCs) (Klug, 2005), comprising 32 countries, mostly in Sub-Saharan Africa (Blustein, 2005). The U.S. already imposes no barriers on most products from these countries, which tend to be raw as opposed to transformed (see Chapter 13, Section 13.13.6.2, AGOA), but this would expand the number. However, the U.S. textile industry objects to this, since on the list, both Bangladesh and Cambodia have competitive textile and apparel industries (Blustein, 2005). The remaining “3% gives the U.S. tremendous flexibility to protect products of real interest to LDCs, such as sugar and textiles” (IATP, 2005). The Washington Post (2005b) editorial page supports this conclusion. These agreements did not include cuts in import tariffs on transformed industrial products (Klug, 2005) (see Chapter 13, Section 13.13.6.2, AGOA). The U.S. avoided discussion of further cuts to its domestic farm subsidy program (Foster, 2005).

By October 2005, the U.S. trade deficit rose to an all time high of US\$ 68.9 billion (for the month),⁴⁷⁵ making one question how far any WTO agreement will get as it must win approval in both the House and Senate of the U.S. Congress (Associated Press, 2005; U.S. Census Bureau, 2005). In protecting its agricultural sector, France has vowed to prevent any further concessions by the 25 EU

⁴⁷⁵ The annual international deficit in goods and services trade for the U.S. reached a record level of \$726 billion in 2005, an 18% increase over 2004 mainly from increased oil prices and Chinese imports (EPI, 2006).

member bloc (Blustein, 2005). The EU refused further cuts on import tariffs on agricultural goods that it had promised to cut by an average of 46% that adversely impacted both U.S. and Developing World farmers, while also failing to get concessions from major developing countries in cutting tariffs on industrial goods and services (Foster, 2005). The adverse impacts of food dumping on developing world farmers have also been taken off the table.

“A series of recent economic studies, including from the World Bank, have steadily downgraded the projected benefits of greater liberalization, while the balance of benefits are now expected to accrue more to the 30 or so developed countries rather than to the approximately 120 others from the developing world” (IATP, 2005) (see Chapter 13, Section 13.12.6, “Fair-trade” Versus “Free-trade”).

This is highlighted by the April 2006 trade talks in which an OXFAM report suggests that

“current proposals would allow both the European Union (EU) and United States to actually increase their trade-distorting spending on agriculture” (Schlein, 2006).

In addition current proposals on Non-Agricultural Market Access (NAMA)

“poor countries will not be able to increase tariffs to protect their domestic sector from increased imports of industrial good”

and may carry over to disallowing tariffs in poor countries to control the dumping of subsidized agricultural products from rich countries that negatively impacts jobs and livelihoods (Schlein, 2006). Changing trade relations between the developed and developing world will likely be a long row to hoe.

Trade Agreements Hurt U.S. Textiles

In some cases, abiding by WTO rules can hurt both developing and developed countries. The United States is the world's biggest textile and apparel importer, buying more than US\$ 77 billion in 2003 of which US\$ 60 billion was subject to import quotas. By the end of 2004, quotas will end according to WTO agreements. U.S. mills that make fabric, thread and clothing lost over half their workers from 1.6 million at the end of 1994 down to 685,600 in 2004, with an expected drop to 449,800 by 2012 (i.e., loss of another 235,800 jobs) projected by the Bureau of Labor Statistics. This is from a combination of many companies moving overseas and increased competition from newly emerging players, especially China and to some degree Pakistan and India. More dire projections, unless there are major changes, are that 67% of the remaining jobs (459,352 out of 685,600) in the U.S. apparel industry could be lost in the next couple of years. The elimination of quotas will not only hurt U.S. workers, but less competitive developing countries (e.g., Bangladesh, Cambodia, Sri Lanka and Nepal), since they were often assured a small guaranteed market. China cannot block Special Safeguard Measures (SSG) as described above, a mechanism that would allow the U.S. Government to slow rapidly rising clothing and fabric imports, which China agreed to in 2001. U.S. textile companies are pushing for caps on Chinese made bras, dressing gowns and knit fabrics, product lines on which quotas were phased out in 2001 followed by skyrocketing Chinese imports. For instance, importation of knit fabric from China to the U.S. reached a peak of US\$ 42.9 million in 2003, an increase in percent by weight of 21,307 from the year 2000. Surprisingly, China has agreed to tax its clothing exports as a means of slowing overseas sales, though it is unclear if this will be significant. U.S. retail stores and U.S. apparel companies with operations overseas, are opposed to the extension of quotas. Projections are for more U.S. companies to move overseas, as well as to source clothes and materials from the Americas and South Asia (Sparshott, 2004). The

Sub-Saharan Africa textile industry will have to rely on preferential treatment from the U.S. under the African Growth and Opportunity Act (AGOA) until it can become competitive (see Chapter 13, Section, 13.13.6.2, AGOA). Overall, the United States had just over a US\$ 200 billion trade deficit with China for 2005 (EPI, 2006; Ho, 2006). Issues around this deficit include a Chinese currency kept at an artificially undervalued giving it an unfair-trade advantage, intellectual property rights to protect American products/patents from pirating and an agreement by China to buy US\$ 16 billion in American products (Ho, 2006).

12.2.4.5 Sub-Saharan Africa marine fisheries and EU subsidies

“For African LDCs seafood exports are worth \$US 570 million - Senegal 28%, Tanzania 19%, Mozambique 12%, Uganda 11% Angola 6%...Seafood exports have grown in importance in Africa in recent years, with exports in SADC quadrupling to \$US 892 million between 1998 and 2001. By that date, African exports to the EU had reached \$US 1.75 billion. Yet the EU subsidizes this sector heavily, at around \$US 1 billion annually: \$US 280 million of which supports 850 vessels to fish outside EU waters. When coupled with highly onerous and perversely worded rules of origin, African exports to the EU are even further undermined. Fishing agreements that allow European boats to fish African waters are often badly negotiated. They only return around \$US 0.8 billion in royalties, and EU tuna boats in five West African states pay less than 1% of the value of the catch to these governments (a governance problem). Transparent and competitive tendering, including more organized action at the regional level, could go some way to ensuring Africa gains from the contracts it offers. At the same time, the subsidized EU fleets have superior equipment, which means they can catch far more than the African boats” (Commission for Africa, 2005).⁴⁷⁶

⁴⁷⁶ “the EU ‘list rules’ for fisheries: "1. The following shall be considered as wholly obtained in a beneficiary country or in the Community: (f) products of sea fishing and other products taken from the sea outside its territorial waters by its vessels;(g) products made on board its factory ships exclusively from the products referred to in (f); 2. The terms ‘its vessels’ and ‘its factory ships’ in paragraph 1(f) and (g) shall apply only to vessels and factory ships: which are registered or recorded in the beneficiary country or in a Member State; which sail under the flag of a beneficiary country or of a Member State; which are at least 50% owned by nationals of the beneficiary country or of Member States or by a company having its head office in that country or

12.2.4.6 Would ending food dumping negatively impact food security?

According to IFPRI (2003), an end to export dumping by rich countries would not hurt food security in developing countries:

“Standard consumer welfare models tend to obscure the damage caused by agricultural dumping. Export subsidies in industrialized countries undermine incentives for small farmers in developing countries, and destabilize local markets”.

Ending food dumping in the long-run could help food security by forcing African governments to invest in agricultural research, extension and infrastructure for the small farmer. IFPRI (2003) found that food dumping, as a source of cheap food to urban populations, is a disincentive for Sub-Saharan African countries providing

“a rationale for failing to give priority to the economic setting in which small farmers operate and for neglecting rural infrastructure. In fact, public investment in agriculture and rural development had fallen off the agenda of ministries of finance, despite the developmental payoffs”.

12.2.5 ILO Demands an End to Subsidies and Trade Barriers

“Many developing countries and LDCs still depend on agricultural commodities for more than half their export earnings. Yet from 1980 to 2000, world prices for 18 major export commodities fell

in one of those Member States, of which the manager or managers, Chairman of the Board of Directors or of the Supervisory Board, and the majority of the members of such boards are nationals of that beneficiary country or of the Member States and of which, in addition, in the case of companies, at least half the capital belongs to that beneficiary country or to the Member States or to public bodies or nationals of that beneficiary country or of the Member States; of which the master and officers are nationals of the beneficiary country or of the Member States, and of which at least 75% of the crew are nationals of the beneficiary country or of the Member States” (Commission for Africa, 2005). Thus, fish taken in foreign waters would be dealt with as though taken from national waters with regards to, tariffs, quotas, taxes, etc.

by 25% in real terms. This fall was particularly significant in the case of cotton (-47%), coffee (-64%), rice (-60.8%), tin (-73%), cocoa (-71.1%) and sugar (-76.6%). There is no simple answer to this problem. However, as a minimum, it is essential that the aggravating effect of agricultural protectionism be removed...Technical support should be stepped up to assist developing countries to diversify their exports and add value to commodities before exporting them. In this regard, the issue of tariff escalation for processed commodities needs to be addressed. In addition, a global coordinated effort should be made on particular commodities such as sugar, cotton, wheat and groundnuts" (ILO, 2004).

12.3 STRUCTURAL ADJUSTMENT, IMF AND THE WORLD BANK

The Meltzer Commission (officially called the International Financial Institution Advisory Commission) was established in 1998 by the U.S. Congress to recommend future U.S. policy toward seven international financing institutions. The Meltzer Commission consisted of some of America's most eminent economists, including, Allan H. Meltzer, Professor of Political Economy at Carnegie Mellon University and a Visiting Scholar at the American Enterprise Institute; Jeffrey D. Sachs, Director of the Center for International Development and the Galen L. Stone, as well as Professor of International Trade in the Department of Economics at Harvard; C. Fred Bergsten, Director of the Institute for International Economics; Charles W. Calomiris, Paul M. Montrone Professor of Finance and Economics at the Columbia University Graduate School of Business and a Professor in the Department of International and Public Affairs at Columbia University's School of International and Public Affairs; Tom Campbell, member of Congress from California's 15th district and Professor of Law at Stanford University and Edwin J. Feulner, president of the Heritage Foundation. They concluded the following with regard to the IMF and World Bank:

"The frequency and severity of recent crises raise doubts about the system of crisis management now in place and the incentives for private actions that it encourages and sustains. The IMF has given too little attention to improving financial structures in developing countries and too much to expensive rescue operations. Its system of short-term crisis management is too costly, its responses too slow, its advice often incorrect, and its efforts to influence policy and practice too intrusive.

High cost and low effectiveness characterize many development bank (e.g., African Development Bank/*Banque Africaine de Developpement* (ADB/BAD) operations as well. The World Bank's evaluation of its own performance in Africa found a 73% failure rate. Only 1 of 4 programs, on average, achieved satisfactory, sustainable results. In reducing poverty and promoting the creation and development of markets and institutional structures that facilitate development, the record of the World Bank and the regional development banks leaves much room for improvement...For the world's truly poor, the provision of improved levels of health care, primary education and physical infrastructure, once the original focus for development funding, should again become the starting points for raising living standards. Yet, poverty is often most entrenched and widespread in countries where corrupt and inefficient governments undermine the ability to benefit from aid or repay debt. Loans to these governments are, too often, wasted, squandered, or stolen...The use of IMF resources and conditionality to control the economies of developing nations often undermines the sovereignty and democratic processes of member governments receiving assistance...The G-7 governments, particularly the United States, use the IMF as a vehicle to achieve their political ends. This practice subverts democratic processes of creditor countries by avoiding parliamentary authority over foreign aid or foreign policy and by relaxing budget discipline...IMF interventions---both long-term structural assistance and short-term crisis management---have not been associated, on average, with any clear economic gains to recipient countries..." (Meltzer Commission, 2000).

As Stiglitz⁴⁷⁷ (2002) puts it, a half century after its founding, the IMF has failed with an ideologically, as opposed to technically driven, “one size fits all” recipe for curing the economic ills of the developing world. The UN (2002) has a similar view of the IMF,

“concerns are frequently expressed about the breadth of Fund conditionality, the perceived arrogance of its staff, the application of a one-size-fits-all approach to policies, and insensitivity to political realities”.

Stiglitz (2002) and Sachs (2005) explain that Washington Consensus policies were based on a simplistic model of market economy, the “competitive equilibrium” model of Adam Smith⁴⁷⁸ that markets by themselves will lead to efficient outcomes driven by a profit motive. Government was to stand aside. This “neoliberal model”, based on free-market fundamentalism *laissez-faire* policies, was popular in the 19th century. However, as the result of the Great Depression and recognition for its failings in the market system, from massive inequality to pollution and decaying cities, the more advanced industrial countries rejected this economic model in favor of government interventions, the degree of intervention and balance between government and markets being debatable (Stiglitz, 2002). The key point here is that the IMF has been imposing on the developing world an economic model the West rejected 70 odd years ago. The relations between the government and the dependence of the private sector on the government to create an enabling environment for the private sector, has been discussed above, (see Section 12.2.2 Subsidies, Don’t Do As I Do, Do As I Say). Stiglitz (2002) also believes mistakes in sequencing these conditionalities without appropriate safety nets was a major problem. He gives examples of eliminating

⁴⁷⁷ Joseph Stiglitz, 2001 Nobel Prize Winner for Economics, Chief economist at the World Bank until January 2000, past Chairman of Clinton’s Council of Economic Advisors, currently Professor of Finance and Economics at Columbia University.

⁴⁷⁸ English economist, 1723-1790, considered founder of modern free-market\conomics.

corrupt marketing boards or downsizing government without first having lined up private sector investments to absorb these people and the boards, abandoning uniform pricing before adequate roads were in place, making it uneconomical for farmers far removed from the market place, the lack of property/resource rights and a court system to enforce these rights. Other examples include privatizing water and electrical utilities, resulting in price increases that the poor cannot sustain, in turn resulting in power and water cuts (Bond, 2002). Without government to allow a slow and progressive transition from public to private sector and to play an appropriate regulatory and facilitative role, the poor only became poorer (see Chapter 11, Section 11.11.6.2, Modern conservation and the Baka Pygmy, discussing impacts of privatizing marketing boards). He argues that proper sequencing and pacing might have enabled one to gradually achieve efficiency gains without these tremendous social costs. Stiglitz (2002) also believes that the IMF structural adjustment policies indicate that its clients are international banks and creditors, rather than developing countries and the poor. Actions are taken to assure that bank's/creditor's loans are paid back regardless of the consequences to the global economy or the welfare of the poor countries, with the net result that IMF policies in the long-term undermine the market, as well as the stability of the economy and society in the developing world

.
Africa and Africans are losing and this could come back to bite the West because of the anger and hatred towards the West, especially America, by the impoverished masses that are today aware, through modern communications such as the Internet and CNN, what the rest of the World has and they do not. Africans are increasingly aware that the wealth in their countries is being extracted by the political elite in collusion with Western Multi-Nationals. This makes much of Africa, a large portion which is Muslim (see Chapter 13, Figure 13.2: Muslim Africa), a hot bed for recruitment of terrorists among the disenfranchised youth who have given up any hope for a viable future and who have little or no regard

for their governments who are corrupt and self-serving. This will be discussed in greater detail in Chapter 13. Ultimately, structural adjustment (ESAP) became known as “Eternal Suffering for African People” (Bond & Manyanya, 2003).

12.3.1 IMF and the World Bank

“Our dream is a world free of poverty”, World Bank corporate motto. “The IMF is a toy of the United States to pursue its economic policy off-shore”, according to MIT economist, Rudiger Dornbusch (*Journal of Commerce*, 1999 In: Sogge (2002)).

The IMF and World Bank lend to the developing world, but are led by the developed world. To date, the head of the IMF is always a European and that of the World Bank, always an American elected behind closed doors with no prerequisite of having experience in the developing world (Stiglitz, 2002).

“Unfortunately, we have no world government, accountable to the people of every country, to oversee the globalization process...Instead we have a system that might be called ‘global governance without global government’...Modern high-tech warfare is designed to remove physical contact: dropping bombs from 50,000 feet ensures that one does not ‘feel’ what one does. Modern economic management is similar: from one’s luxury hotel, one can callously impose policies about which one would think twice if one knew the people whose lives one was destroying” (Stiglitz, 2002).

Thus, Stiglitz argues, the IMF, World Bank and WTO are public institutions, isolated from their constituencies and are answerable to no one for their actions, regardless of the consequences. They demand transparency from the rest of the world while they have little or no transparency, with many decisions being made that are not open to public scrutiny or debate, undermining the very idea of open societies and democracy.

“The World Bank and International Monetary Fund (IMF) were created at the Bretton Woods Conference in New Hampshire, U.S.A., in 1944. They were designed as pillars of the post-war global economic order. The World Bank’s focus is the provision of long-term loans to support development projects and programs. The IMF concentrates on providing loans to stabilize countries with short-term financial crises” (Smith, 2001).

Many in the world today see

“America as ‘controlling the global economy,’ either through its multinationals or its ‘puppets’, the World Bank and International Monetary Fund (IMF)” (Chua, 2003).

“The rules of modern world trade (the IMF/World Bank/GATT/NAFTA/WTO/MAI/FTAA)⁴⁷⁹ defined by corporations, and those rules enforced by the financial and military might of powerful nations essentially governed by those same corporations, define today’s world trade as corporate imperialism. Besides the military, which is the final arbiter, the power of the imperial centers of capital to lay claim to the wealth of the developing countries rests in their monopolization of finance capital. No bank in the world will loan to a country blacklisted by the World Bank...Corporate mercantilists moving to areas with cheap labor, tax breaks, ransom payments, and no environmental protections are transferring to society what are properly industrial production costs and banking those unpaid costs as profits” (Smith, 2001).

The net result is more poverty, less education for the poor and profits for the multi-nationals and the already super-rich, often political elite of the host country (Chomsky, 1999). Up until now, in most cases, no middleclass has been created and pollution, both in the work place and externally, has been a major problem.

⁴⁷⁹ General Agreement on Tariffs and Trade (GATT); North American Free-Trade Agreement (NAFTA); World Trade Organization (WTO); Multilateral Agreement on Investment (MAI); Free-trade Area of the Americas (FTAA), expansion of NAFTA.

The World Bank and IMF became increasingly powerful in Africa with the economic crisis of the early 1980s (Patel & Delwiche, 2002). In the late 1970s, rising oil prices, rising interest rates and falling prices for other primary commodities left many poor African countries unable to repay mounting foreign debts (Smith, 2001; Colgan, 2002; Legum, 2002; Zack-Williams, 2002 *In: Zack-Williams, et al.*, 2002).

To assure that the IMF and World Bank had plenty of disciples singing the same tune, technocrats were trained in fundamental economic doctrine, beginning as early as the 1970s that took up key government positions in Latin America, Indonesia and eventually, Russia. In 1990, the World Bank and UNDP created the African Capacity Building Initiative, which by 2001 was training central bank and finance ministry staff, teaching at 33 African universities along with research and joint projects. Since 1964, the IMF has trained more than 10,000 officials world-wide in its policies and practices. This coercion, social engineering, reduced public services and leadership indifference to citizen's wishes has triggered violence (Sogge, 2002) across the African continent and many other places in the world. Former chief economist and vice president of the World Bank from 1992-1997, Joseph Stiglitz, had this to say about IMF policies:

"Since the end of the Cold War, tremendous power has flowed to the people entrusted to bring the gospel of the market to the far corners of the globe. These economists, bureaucrats, and officials act in the name of the United States and the other advanced industrial countries, and yet they speak a language that few average citizens understand and that few policymakers bother to translate. Economic policy is today perhaps the most important part of America's interaction with the rest of the world. And yet the culture of international economic policy in the world's most powerful democracy is not democratic" (Stiglitz, 2000).

He goes on to explain how the IMF's and the U.S. Treasury Department's "cookie cutter" approach to macroeconomic policy helped fuel economic crises in East Asia and Russia by, among others; 1) Liberalizing their financial and capital markets, 2) Cutting subsidies for food and fuel, 3) Devaluation of local currencies and 4) Privatizing industries (necessary) in a manner that benefited only a few elites (Stiglitz, 2000) (see Sections 12.3.4.2, Structural adjustment and privatization of parastatals & 12.3.4.4, Trade and structural adjustment policies [SAP]). In Russia while

"only 2% of the population had lived in poverty even at the end of the dismal Soviet period, 'reform' saw poverty rates soar to almost 50%, with more than half (50%) of Russia's children living below the poverty line" (Stiglitz, 2000).

This is supported by UNCTAD (2001 *In: House of Commons*, 2002), stating that

"concerns increased in the aftermath of the East Asian crisis, when excessive conditionalities led to policy responses which intensified the crisis. As a result, there have been calls, including within the International Monetary and Financial Committee, for the streamlining and refocusing of surveillance in line with the Fund's (IMF) core competence in macroeconomic policy and related reforms".

Stiglitz (2002) explains that the World Bank and especially the IMF and their policies are heavily controlled by the U.S. Treasury Department, which in turn is closely linked to the narrow interests of the Wall Street financial community. In many instances, the Treasury Department went around the wishes of the U.S. Congress (Stiglitz, 2002) who appeared to play "second fiddle" to Wall Street, many of the IMF's and the Treasury Department's key decision-makers seeming to rotate in and out of Wall Street; i.e. Stan Fischer⁴⁸⁰ and Robert Rubin.⁴⁸¹ Very often, the very policies imposed on other countries were the opposite of those that

⁴⁸⁰ Fischer went from Deputy Managing Director of IMF to vice chairman of Citigroup.

⁴⁸¹ Robert Rubin went from chairman of Citigroup to Secretary of Treasury, where he had a central role in IMF policies.

Stiglitz recommended as chairman of the Council of Economic Advisors to the President of the United States during the William (Bill) Jefferson Clinton Administration. For instance, the Washington Consensus believed in the ideology of trickle-down economics, that is growth trickling down to the poor, a policy the Clinton administration argued against in favor of active programs to help the poor (Stiglitz, 2002). Dr. Stiglitz was forced to resign from the World Bank for his stance over these issues; for speaking out (Palast, 2001).

It will be seen below that many of these same policies are plaguing Africa and from an economic, development and conservation standpoint, have been catastrophic to the continent's people and their future. Dr. Stiglitz, the 2001 Nobel Prize winner in economics, has called for a Post-Washington Consensus. Since the early 1980s, the "Washington Consensus" of free-market fundamentalism and its hegemonic ideology-shaped economic policy has been imposed to the detriment of billions of people worldwide. This free-market formula is being rejected in many spheres, especially since the East Asian crisis of 1997 (Bond & Manyanya, 2003). As discussed, even the USA protects many of its fragile economic sectors against international competition in order for them to survive, rebuild and continue employing people.

12.3.2 IMF and the World Bank, Instruments of the Cold War

"The World Bank and IMF were important instruments of Western powers during the Cold War in both economic and political terms. They performed a political function by subordinating development objectives to geo-strategic interests. They also promoted an economic agenda that sought to preserve Western dominance in the global economy. Not surprisingly, the governments of the world's richest countries direct the World Bank and IMF. Combined, the 'Group of 7'⁴⁸² (U.S., Britain, Canada, France, Germany, Italy and Japan), hold more than 40% of the votes on the Boards of Directors of these institutions. The U.S. alone accounts for almost 20%" (Colgan, 2002).

⁴⁸² The G-7 is now the G-8 with Russia joining the group.

During the Cold War, Africa became a chessboard where the ideological differences between the West (North America and Europe) and East (Former Soviet Union, China and Cuba) were played out, while the people of Africa were expendable “pawns” who suffered the consequences. The key for the West was to keep the physical and ideological presence of the East off the African continent at all costs, to maintain the West’s presence on the continent and to secure the vote of African countries in key international forums, such as the United Nations and even the Convention on International Trade in Endangered Species (CITES).

Both sides were at fault.

“First, the displacement of democracies in poor countries, particularly in Africa, often occurred during the Cold War with the connivance of the great powers. Whenever a military strongman displaced a democratic government, the new military dictatorship tended to get support from the Soviet Union (if the new military rulers were pro-Soviet) or from the United States and its allies (if the new rulers were anti-Soviet and pro-West). So there is culpability on the part of the dominant powers in the world, given past history, and there is some responsibility now for rich countries to help facilitate the expansion of democratic governance in the world” (Sen, 2002).

“The U.S. Central Intelligence Agency (CIA) reported in 1995 that money from International Monetary Fund (IMF) loans was going to Swiss banks. President Bill Clinton and Secretary of State Madeleine Albright acknowledged the United States’ Cold War ‘complicity with tyrants and warlords across Africa’. Now that the tyrants are gone, the men, women and children of Africa carry the debt burden. The debts include those incurred by Liberian Samuel Doe for US \$1.3 billion; Somalia’s Mohammad Siad Barre for \$2.4 billion and Sudan’s Gafaar Nimeiri for an astonishing \$16.7 billion, etc. When Mobutu Sese Seko⁴⁸³ was overthrown and died in 1998, the debt was over \$13 billion. The West backed Mobutu as a loyal ally in the Cold War. As early as 1974 there were warnings of loans being stolen. In 1978 the IMF’s Erwin Blumenthal resigned from a key post in Zaire’s central bank saying that ‘the corruptive

⁴⁸³ Of the former Zaire, today’s the Democratic Republic of Congo.

system in Zaire with all its wicked and ugly manifestations' was so serious that there is 'no (repeat: no) prospect for Zaire's creditors to get their money back.' After Blumenthal's report to the IMF, it tripled its lending to Zaire. In 1987, when Mobutu made his territory available for U.S. covert action against neighboring Angola, the U.S. pushed through yet another IMF loan to Zaire – this time over the objections of some IMF officials. Nigeria estimates that former military governments have stolen billions of dollars, and deposited these in British, U.S. and Swiss banks. Nigeria's foreign debt is now \$34 billion (a country rich in oil that has no reason to be indebted to anyone). The U.S.-based Citibank has a special 'private banking division' which was set up to deal with just this sort of money. On 8 November 1999, it gave the U.S. Senate Governmental Affairs Committee details of accounts of four wealthy developing country leaders, Raul Salinas, brother of a former President of Mexico, \$80-\$100 million; former Pakistan Prime Minister Benazir Bhutto, \$40 million; Gabon President Omar Bongo, \$130 million; and the sons of Nigeria's former dictator Sani Abacha, \$110 million" (Hanlon & Pettifor, 2002).

Dakar, Senegal was an emergency "Transoceanic Abort Landing (TAL) site for the Space Shuttle until July 1988 when Banjul International Airport in the Republic of the Gambia was activated (NASA, 2006). Additionally, Dakar is the furthest western point in West Africa. During the Cold War of the 1970s and 80s, it is said that deepwater channels off of Dakar served as important areas of movement for Western submarines. So-called Russian fishing vessels, which among them were alleged spy vessels, were only allowed to dock in Dakar to exchange crews via a periodic Aeroflot flight. It is alleged that both France and the USA dumped money directly into government coffers to pay functionaries and it is known that France/EU helped subsidize Senegal's peanut economy (see Chapter 5, Section 5.6.3.2, Foreign assistance in Sahel goes for large scale as opposed to improving traditional agriculture - Cold War Politics and Western Donor Impacts on Food Production, Senegal and Chapter 11, Section 11.6.7, Foreign Aid and Puppet Governments – "Donor Democracy"). In other words, Senegal, as a geo-strategic location, had an "artificial economy" propped up by the West at all costs, as long as it remained on the side of the West and minimized

the presence of Russia and other communist regimes. For instance, China's only presence in the region was in the form of building soccer stadiums and providing some doctors in rural areas, but ideologically, Senegal was pro-Western with a lot of "influence" from both France and the United States. It seemed like debts were written off and/or rescheduled/restructured on a regular basis linked to the adoption of structural adjustment policies (Colgan, 2001). Western donors, including the IMF and World Bank, played a major role in assuring allegiance to the West.

More recently, the Wall Street Journal and the Washington Times have run articles in 2005/2006 accusing the IMF of supporting debt relief to the Denis Sassou-Nguesso regime of Congo Brazzaville (see Chapter 13, Section 13.10.1.4, Petroleum war, Congo Brazzaville), even after audits indicate siphoning off oil money into front companies run by his son and the chief of the new state oil company, *Société Nationale des Pétroles du Congo* (SNPC). The IMF executive board approved a key December 2004 agreement with Congo Brazzaville just weeks after Congo Brazzaville engaged a revolving-door Washington-based consulting firm made up of former IMF senior officials, up to and including a former deputy managing director. There is a call for the world's multi-national institutions such as the UN (Oil-for Food debacle in the Iraq), the IMF and the World Bank and their bureaucrats to be held accountable for their performance and conflict of interest (Rahn, 2006). To this should be added bilateral donors, international consulting firms and NGOs (see Chapter 11, Section 11.7.2, Foreign Assistance Conditionalities Good Business For Donor County Not Recipient/Host Country), as well as the international private sector in general (see Chapter 13 in general and Section 13.12.1 "Publish What You Pay" an Attempt at Developing Transparency in Distribution of Wealth from Africa's Natural Resources).

Post Cold War or African Independence transitions to democracy were merely negotiated elite power-transfers. Below the façade of multi-partyism, the overall parameters were set in Washington. Most deals left the economic status quo intact no matter how unequal and unsustainable. Transitions replaced the repression of generals/politicians with neo-liberals favored by bankers and businessmen. The new ruling elite went along for the ride and/or bought into the Washington Consensus ideology (Bond & Manyanya, 2003).

12.3.3 Structural Adjustment and Cross Conditionalities

“World Bank and IMF (structural) adjustment programs differ according to the role of each institution. In general, IMF loan conditions focus on monetary and fiscal issues. They emphasize programs to address inflation and Balance of Payments (BOP)⁴⁸⁴ problems, often requiring specific levels of cutbacks in total government spending. The adjustment programs of the World Bank are wider in scope, with a more long-term development focus. They highlight market liberalization and public sector reforms, seen as promoting growth through expanding exports, particularly of cash crops. Despite these differences, World Bank and IMF adjustment programs reinforce each other. One way is called ‘cross-conditionality.’ This means that a government generally must first be approved by the IMF, before qualifying for an adjustment loan from the World Bank. Their agendas also overlap in the financial sector in particular. Both work to impose fiscal austerity and to eliminate subsidies for workers, for example. The market-oriented perspective of both institutions makes their policy prescriptions complementary” (Colgan, 2002).

⁴⁸⁴ A comprehensive statement of a country’s economic transactions with the rest of the world for a given period of time - normally a quarter or a year - composed of the current account (measures transactions associated with trade in goods and services, investment income and transfers) and the capital account (measures financial flows such as purchases of bonds and equities or direct investment activities). BOP not to be confused with the balance of trade - a narrower concept that measures only trade in goods and services (GOC, 2005).

12.3.4 Structural Adjustment, U.S. Movement to Control Developing Economies

As a result of structural adjustment policies,

“many are caught in a series of vicious spirals: lack of food leads to poor health, which limits their earning ability, leading to still poorer health. Barely surviving they cannot send their children to school, and without an education, their children are condemned to a life of poverty”, this poverty being passed on to the next generations (Stiglitz, 2002).

Structural adjustment programs have failed to induce sustainable growth, let alone development in any African country. They have also failed to alter the way in which politics works in contemporary Sub-Saharan Africa. African elites have instrumentalized structural adjustment politically as a scapegoat for national economic crises, while extracting continual foreign aid to maintain their power base (Chabal & Daloz, 1999).

“It was U.S. policy during the Reagan Administration in the early 1980s, to expand the role of the World Bank and IMF in managing developing economies. The dependence of African countries on new loans gave the World Bank and IMF great leverage. The conditions attached to these loans required African countries to submit to economic changes that favored ‘free-markets.’ This standard policy package imposed by the World Bank and IMF was termed ‘structural adjustment.’ This referred to the purpose of correcting trade imbalances and government deficits. It involved cutting back the role of the state and promoting the role of the private sector. The ideology behind these policies is often labeled ‘neoliberalism,’ ‘free-market fundamentalism,’ or the ‘Washington Consensus.’ From the 1970s on, this orientation became the dominant economic paradigm for rich country governments and for the International Finance Institutions (IFIs).

The basic assumption behind structural adjustment was that an increased role for the market would bring benefits to both poor and rich (trickle down economics). In the Darwinian world of international markets, the strongest would win out. This would encourage others to follow their example. The development of a market economy with a greater role for the private sector was therefore seen as the key to stimulating economic growth. The crisis experienced by African countries in the early 1980s did expose the need for economic adjustments. With declining incomes and rising expenses, African economies were becoming badly distorted. Corrective reforms became increasingly necessary. The key issue with adjustments of this kind, however, is whether they build the capacity to recover and whether they promote long-term development. The adjustments dictated by the World Bank and IMF did neither" (Colgan, 2002).

Geo-politically, by keeping countries indebted, while pouring in large amount of "foreign aid", the West was able to keep Sub-Saharan African countries poor, dependent and exploitable by the West, both from the standpoint of natural resources and for ideological/political purposes.

Structural adjustment grew out of the World Bank's prognosis in the early 1980s of the sources of economic decline in Africa (Martin & O'Meara, 1995):

- Structural: History, politics, geography and climate;
- External: Disadvantaged position of African economies in the international market place; and
- Domestic Policies: Exchange rates, agriculture and the government's role in the economy.

The major problem for Sub-Saharan Africa began in the 1970s and 1980s when prices for most of their primary exports (e.g., coffee, cocoa, copper, oil) collapsed.

"In the early 1980s, Africa's debt crisis worsened. The ratio of its foreign debt to its export income grew to 500%. African countries needed increasing amounts of 'hard currency' to repay their external debts (i.e. convertible foreign currencies such as dollars and deutschmarks). But their share of world trade was decreasing and their export earnings dropped as global prices for primary commodities fell. The reliance of many African countries on imports of manufactured goods, which they themselves did not produce, left them importing more while they exported less. Their Balance of Payments problems worsened and their foreign debt burdens became unsustainable.

African governments needed new loans to pay their outstanding debts and to meet critical domestic needs. The World Bank and IMF became key providers of loans to countries that were unable to borrow elsewhere. They took over from wealthy governments and private banks as the main source of loans for poor countries. These institutions provided 'hard currency' loans to African countries to insure repayment of their external debts and to restore economic stability" (Smith, 2001).

While African countries needed sources of finance, Western banks sought outlets for monetary reserves, which the Organization of the Petroleum Exporting Countries (OPEC) had placed with them as a result of oil price hikes, which also hurt the emerging African nations. Loans were provided to African nations, with low interest rates, which were rolled over to the point that it became difficult to pay off the interest, let alone the loans. In turn, the IMF provided loans to these countries, undertook debt swaps or rescheduled debt under the conditions they followed prescribed economic policy reforms under the guidance of the IMF and World Bank (Colgan, 2001; Legum, 2002). Rescheduling became a ritual; by 1990, 30 African countries negotiated 120 debt reschedulings (Meredith, 2004). Between 1985 and 1990, Sub-Saharan Africa paid out more in interest to the IMF and the World Bank combined than it received from them in foreign grants and loans (Helleiner, 1992 *In: Martin & O'Meara, 1995*).

The structural adjustment programs of the early 1980s were meant to provide temporary financing to borrowing countries to stabilize their economies. These loans were intended to enable governments to repay their debts, reduce deficits in spending and close the gap between imports and exports. Gradually, these loans evolved into a core set of economic policy changes required by the World Bank and IMF. They were designed to further integrate Sub-Saharan African countries into the global economy, to strengthen the role of the international private sector and to encourage growth through trade. Faced with the threat of a cutoff of external funds needed to service the mounting debts they had incurred from the Western private banks that had gone on a lending binge in the 1970s, these countries had no choice, but to implement the painful measures called “conditionalities” demanded by the Bank and Fund. These usually included (Bello & Cunningham, 1994; Martin & O’Meara, 1995; Colgan, 2002; Stiglitz, 2002):

- Cutbacks in government expenditures, especially in social spending (e.g., education and health);
- Rollback or containment of wages;
- Privatization of state enterprises and deregulation of the economy;
- Elimination or reduction of protection for the domestic market and less restrictions on the operations of foreign investors;
- Successive devaluations of the local currency in the name of achieving export competitiveness;
- Increased interest rates; and
- Elimination of food and agricultural subsidies.

The underlying intention was to minimize the role of the state (Martin & O’Meara, 1995; Chabal & Daloz, 1999, Colgan, 2002; Stiglitz, 2002). Rosenblum & Williamson (1987) consider IMF measures a “pernicious form of neo-colonialism”.

12.3.4.1 Downsizing governments

Regardless of fiscal measures taken, many African governments and countries as currently delineated are not economically viable. For every resource rich Angola, The Democratic Republic of Congo and Gabon, that has a wealth of resources, there is a resource poor Gambia, Mauritania, Niger, *République Centrale Africaine* (RCA)/Central African Republic (CAR) and Somalia (see Chapter 11, Section 11.2.2, Economic viability of Sub-Saharan African countries at independence and Chapter 13, Section 13.18.1, Going Local Where Necessary, Development of Regional Markets).

This is a major reason that central governments are reluctant to return Sub-Saharan Africa's natural resources to their rightful owners, the rural communities living with these resources (see Chapter 9, Section 9.7.2, Reluctance to Devolve Control and Ownership of Resources to Landholders). Top heavy, expensive bureaucracies feel they need the wealth directly from these resources in order to survive, as opposed to taxation of the rural resource owners, allowing this wealth to stay in the rural areas, trickling its way up to the capital as it exchanges hands many times, creating a vibrant consumer economy. The political elite in the governments often go into partnership with the private sector, Western NGOs and donors to extract the wealth of rural Sub-Saharan Africa (e.g., timber, wildlife, fish and minerals) to the benefit of these stakeholders, while rural Africans only become poorer (see Chapters nine and 11). This has stymied the evolution of a formal African private sector, keeping most entrepreneurs small and driven into underground non-formal economies; African governments acting as both "player and referee" setting the rules and extracting the benefits directly.

A major problem that structural adjustment was to address, the over-dependence on African governments as the major employer of educated people, resulted from

there being little of a “formal” private sector. As René Dumont (1966) put it, one cannot develop a country by doubling the employees in administrative services or by “distributing sinecures”⁴⁸⁵ to one’s friends, as was the case when the principal author first arrived in Africa in the mid-1970s. René Dumont (1966) explained (see Section 11.2.2, Economic Viability of Sub-Saharan African Countries at Independence),

“we imposed an administrative structure on a backward economy that could not support the weight; and a trade structure which benefits industrial countries but blocks African growth”.

Dumont went on to say that the principle “industry” of these countries at the moment is administration, that is work in the government bureaucracies. Bureaucrats do not create wealth. They only spend money and thus cannot be the driving force of a country’s economy. Bureaucrats cost money and with little or no formal private sector or industries, currency strapped African governments fell into the trap of donor dependency and debt relief, which, in theory, structural adjustment (SAP) was to address through downsizing.

Downsizing government was a controversial move, since with a very small formal sector, most educated people in Sub-Saharan Africa were/are tied to government service and for every employee approximately 20-30 people in the extended family were dependent on a government salary (Rosenblum & Williamson, 1990). With no private sector to absorb these people, millions of individuals would potentially be without basic life support. A major problem is the sequencing of privatization so that as public retrenchments take place, there is an adequate private sector to absorb those laid off from the dismantling of state run institutions, be they bureaucracies or parastatals, otherwise there will be a major disruption of social and economic support (Alemayehu, 2000). The principal

⁴⁸⁵ Creation of salaried jobs of little substance or responsibility as part of a patronage system, as described in Chapter 11.

author remembers that in the 1980s, while working in Guinea-Conakry, the concern that his counterparts had on what such actions would do to social support networks potentially impacting a couple hundred thousand people, linked to the extended family.

With the loss of this support network afforded by the patronage system of the bureaucracy linked to the extended family, structural adjustment also required user fees for health care, education and basic social infrastructure. Many people could not afford these fees, resulting in a decline in the quality of basic services available to the average person, which we in the West take for granted. The immediate consequence of these changes was to weaken the already precarious situation of a very large number of Africans. Urban dwellers in particular, suffered high levels of unemployment and a serious fall in their standard of living, often leading to civil strife (Chabal & Daloz, 1999; Chomsky, 1999; Sogge, 2002; Stiglitz, 2002). The World Bank has shown that civil strife is systematically related to adverse economic factors, including unemployment resulting from excessive austerity; better to moderate inflation than violence and civil strife, resulting from unreasonable structural adjustment conditionalities (Stiglitz, 2002). It is clear that neo-liberal doctrines undermined education, health, increased inequality and reduced labor's share in income (Chabal & Daloz, 1999; Chomsky, 1999; Bond, 2002; Sogge, 2002; Stiglitz, 2002).

12.3.4.2 Structural adjustment and privatization of parastatals

A major shortcoming of structural adjustment is that it is based on government-to-government loans. Governments are not entrepreneurial by nature.

"The very nature of structural adjustment was itself contradictory: the adjustment reforms were to be implemented by the very state which was intended to be 'reduced.' Furthermore the reward for adjustment was renewal of financial aid to the state" (Chabal & Daloz, 1999), resulting in even more debt.

African politicians/elite spent this money with little impact on the economy. Many of the loans and foreign aid grants over the last 30 years have gone to fund government parastatals that were not dismantled and which are inefficient, wasteful by nature and are financial failures, putting the country further into debt and taking away from the basic services (e.g., health, education and roads) which is the role of the government to provide its citizens. Martin and O'Meara (1995) reported that between 1986 and 1992, only five countries had divested more than 40% of their parastatals and these five had the fewest parastatals of 100 or less. Countries with more than 200 parastatals, such as Kenya and Tanzania, had divested less than 10% of their public enterprises. Meredith (2004) discusses how 67% of IMF/World Bank loans between 1989 and 1991 went to parastatal reform with little oversight. African leaders sold off these government assets to political cronies and select businessmen at minimal prices on highly favorable terms, including low-interest loans and lengthy pay-off time in return for kickbacks.

Options for those retrenched could potentially be 1) Leave with compensation, 2) Continue with private sector owner or 3) Management employee buy-out (Alemayehu, 2000). In essence, option three is an employee-owned company in which all workers are shareholders, having not only experience in running the company, but also vested interests due to profit sharing in seeing the company grow and become successful. The worker gets this profit not the state, but the state collects income tax from the worker and the company (see declining terms of trade below for further discussion).

12.3.4.3 Structural adjustment and creation of government bourgeoisie

René Dumont (1966) believed the use of foreign aid to balance budgets relieved African governments from becoming economically mature and created a new bourgeoisie of the civil service “delinked” from the impoverished rural masses.

Very often, the IMF/World Bank loans were used to service interest rates on debt, instead of paying off the debt. These loans in turn, add to the national debt, since they have to be paid off and they have interest rates attached to them (Stiglitz, 2002). By the end of the 1980s, debt service accounted for 25% of exports of goods and services from Africa (Meredith, 2004). Thus, the developing world became caught in a downward spiral from which it could never escape. Government elites did not mind. In Swahili, these elite are called “*Wa-Benzis*” – literally in the eyes of local people, they have turned into a tribe, driving vehicles which they otherwise could never afford, taking free trips overseas and skimming loan/grant money, which is often not very well accounted for.

In many cases, IMF interventions have left countries just as impoverished, but with more debt and an even richer ruling elite (Stiglitz, 2002). Artificially balancing budgets also makes artificially high salaries possible and financial investment in urban construction, such as the villas of Dakar. The elite practiced what Chabal and Daloz (1999) call ‘politics of the mirror’, going through the motions of fulfilling World Bank, IMF and donor condition precedents, but with little actualization at the implementation stage. In turn, the elites redistributed much of the foreign aid to maintain their power through neo-patrimonial relationships. Structural adjustment was “Africanized” (Chabal & Daloz, 1999). Structural adjustment is akin to reorganizing a bankrupt company, along with a massive infusion of capital and then putting it back into the hands of the incompetent managers who ruined it in the first place (Guest, 2004).

12.3.4.4 Trade and structural adjustment policies (SAP)

Impacts of Currency Devaluation

Among SAP policies “is the stipulation that countries receiving Structural Adjustment Loans (SALs) must concentrate on increasing their exports so as to increase their income of ‘hard’ currency, needed for servicing their debts. The IMF priority here is to sort out BOP (Balance of Payments) deficits as fast as possible. For the majority of countries, particularly those on the African continent, this means increasing their production and exports of cash crops, raw materials for use in ‘developed countries’ industries” (Copeland, 2000).

“Another condition also designed to increase exports and bring more money into LDCs, is the devaluation of currencies. So as to make exports more attractive on the global market, countries receiving SALs (Structural Adjustment Loans) have had to devalue their currencies, something that was arguably necessary in many countries. However, currency devaluation in conjunction with liberalization, especially if we bear in mind that a large number of countries - all exporting the same crops - have been subject to these structural adjustments, has led to a marked drop in income to most ‘beneficiaries’ (Farmers, marketing boards/wholesalers and governments).

Thus, devaluing currencies automatically mean the exporting countries earn less. Furthermore, an obvious consequence of having a large number of, for example, coffee exporting countries all increasing their exports simultaneously, is for the market price to go down. This has indeed been the case whilst Sub-Saharan African countries doubled their exports over the 1980s, their share of world trade halved, from 4% to 2%” (Copeland, 2000).

The Commission for Africa (2005) places the drop in Africa’s share in world trade from 6% in 1980 to less than 2% in 2002.

Usually commodities [(unprocessed cotton, coffee, sugarcane, cocoa, bananas) and raw materials (oil, gold, diamonds, COLTAN (columbite-tantalite), platinum

and bauxite] are exported. Historically, this has been a partial reason for dependent economies and poor nations. To export commodities (which are cheap), to be denied industrial capital and real technology transfer and to, therefore, import finished products (which are more expensive due to the added labor to make a product from resources), nations that are primarily commodity exporters are likely to lose out as there would be little multiplier effect in their own economies. This was the role/rule enforced on former colonies under imperial or colonial rule (Shah, 2002; Hilary, 2002) and in recent times encouraged under structural adjustment.

Commodity Crisis

“The commodity crisis is the principal challenge to the achievement of economic and social development, and ecological sustainability in the majority of developing countries today...In 2001, real commodity prices for agricultural raw materials and minerals, ores and metals have fallen to 60% of their price levels in 1980” (Tan, 2002 *In:* Shah, 2002).

“In only seven years, the price of a tractor for Tanzania, measured by the export value of Tanzanian sisal, doubled. The relative value for rubber exporters dropped 300% between 1960 and 1975. Cotton exporters lost 60% of their buying power in the same time span. The prices of primary commodities that the developing countries export have collapsed to the same price as 21 years earlier while prices for manufactured products have soared, forcing the developing countries to export more and more while importing less and less” (Smith, 2001).

“The history of commodity price stabilization efforts and the collapse of commodity agreements is indicative of the vested interest of northern industrialized countries (under pressure from domestic corporate lobbies) to keep commodity prices at consistently low prices. It is also illustrative of the legacy of colonial economic relations between the north and south that continues today under the guise of structural adjustment programs and multilateral trade rules favoring developed countries. Inappropriate policy advice from International Finance Institutions (IFIs), notably the World Bank and

the IMF, and enforced through lending conditionalities have exacerbated the situation of overproduction” (Tan, 2002 *In:* Shah, 2002).

For instance, if many developing countries are encouraged to grow coffee, the global market becomes saturated and prices fall. If devaluation results in the costs to the producer going up because of increased costs of inputs, while he is paid the same or less, but his buying power decreases, to compensate he may produce even more to make up for the relative loss in buying power. This creates a saturated market and a cycle of declining prices, and can result in possibly mining and degrading soils, and even expanding into marginal areas for short-term gains where the needs for inputs are initially less (see Section 12.2.4.4, Cotton subsidies and protected markets).

Declining “Terms of Trade” Associated With Structural Adjustment

Therein lays the problem. Sub-Saharan Africa exports mostly raw products, whose value continues to decline, and then buys them back transformed for more than they paid for them, resulting in declining terms of trade⁴⁸⁶ (Commission for Africa, 2005).

On average in Africa, 78.6% of exports are primary products which contribute to 21.2% of the GDP, with resource rich African countries (e.g., especially those with minerals) having among the lowest quality of life rankings⁴⁸⁷ in the world (Commission for Africa, 2005). This latter issue will be discussed in some detail in Chapter 13.

⁴⁸⁶ Weighted average of a nation’s export prices relative to its import prices. Deteriorating “terms of trade” means the price of exports has decreased relative to the price of imports.

⁴⁸⁷ Human Development Index (HDI): “The UNDP ranks countries from 1 (highest) to 177 based on an aggregate of three indicators: life expectancy, education as measured by literacy and school enrolment rates, and standard of living as measured by per capita GDP and purchasing power” (Commission for Africa, 2005).

Combined with devaluated currencies where trade liberalization occurred, by taking away trade barriers and government subsidies, African producers were ill equipped to cope with increased competition from cheap foreign goods (Martin & O'Meara, 1995). This is “unequal” trade:

“At first glance it may seem that the growth in development of export goods such as coffee, cotton, sugar, and lumber, would be beneficial to the exporting country, since it brings in revenue. In fact, it represents a type of exploitation called unequal exchange. A country that exports raw or unprocessed materials may gain currency for their sale, but they lose it if they import processed goods. The reason is that processed goods -- goods that require additional labor -- are more costly. Thus a country that exports lumber but does not have the capacity to process it must then re-import it in the form of finished lumber products, at a cost that is greater than the price it received for the raw product. The country that processes the materials gets the added revenue contributed by its laborers” (Shah, 2002).

“Reliance on just a few commodities makes countries even more vulnerable to global market conditions and other political and economic influences. More than 50 developing countries depend on three or fewer commodities (raw products) for over half of their export earnings. Twenty countries are dependent on commodities for over 90% of their total foreign exchange earnings, says the World Bank” (Shah, 2002).

“Falling [commodity] prices have meant that large increases in export volume by commodity producers have not translated into greater export revenues, leading to severely declining ‘terms of trade’ for many commodity producing countries. When the purchasing power⁴⁸⁸ of a country's exports declines, a country is unable to purchase imported goods and services necessary for its sustenance, as well as generating income for the implementation of sustainable development programs. A vast majority of developing countries depend on commodities as a main source of revenue. Primary commodities account for about half of the export revenues

⁴⁸⁸ Purchasing power of money is measured by the quantity and quality of products and services it can buy, also called buying power.

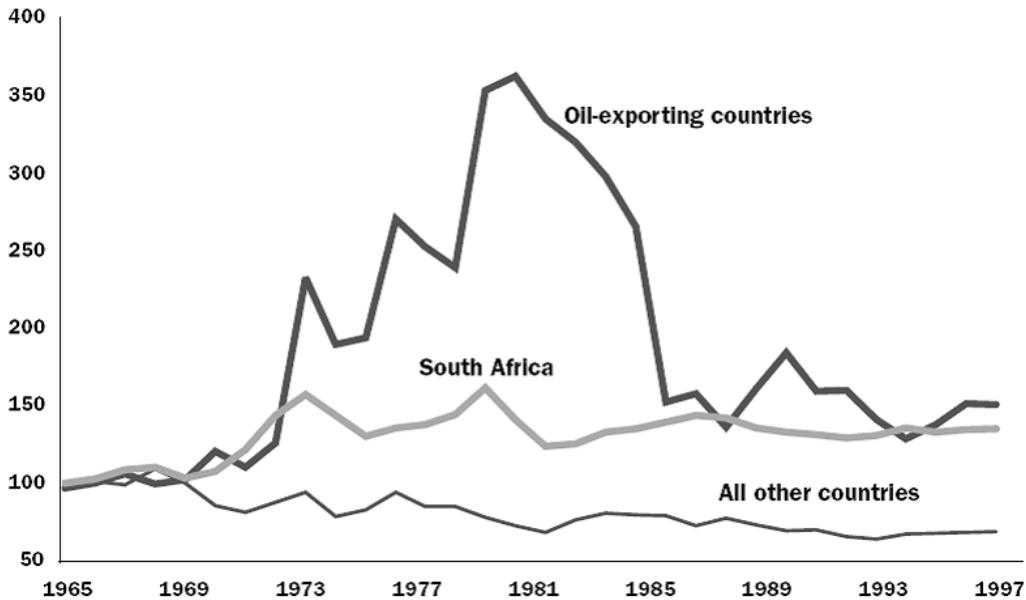

of developing countries and many developing countries continue to rely heavily on one or two primary commodities for the bulk of their export earnings" (Shah, 2002).

After a decade of structural adjustment reforms, little progress has been made in either reducing African economies' foreign debts or in expanding and diversifying their productive capacities, let alone improving the living standards of the vast majority of the people. The World Bank found that in adjusting countries, between 1981-86 and 1987-91, the annual rate of economic growth⁴⁸⁹ increased for half, but declined for half. Generous flows of "external aid" for adjusting countries accounts for any positive results, while deteriorating "terms of trade" for exports – mostly of raw products – accounts for the decline in economic growth (Martin & O'Meara, 1995) (Figure 12.1).

For example, according to the International Coffee Organization (ICO), the free on board (f.o.b.) value of coffee dropped from US\$ 10-12 billion in the early 1990s to US\$ 5.5 billion today. This affected the livelihoods of 125 million people in the developing world, while retail sales, mostly in the West, jumped from US\$ 30 to 70 billion in the same time frame. Without an Organization of the Petroleum Exporting Countries (OPEC) for coffee and other raw commodities to control availability and negotiate prices, producing more only gets Sub-Saharan Africa and the rest of the developing world less (Kousari, 2004).

⁴⁸⁹ Economic growth is the annual percentage rate change (from year to year) in a nation's "real" (adjusted to remove the effects of inflation) gross domestic product (real GDP)

Index: 1965 = 100

Figure 12.1: Sub-Saharan Africa's "Terms of Trade" by country group, 1965-1997

Colgan (2002) concluded that “During the 1980s, when most African countries came under World Bank and IMF tutelage, per capita income declined by 25% in most of Sub-Saharan Africa. The removal of food and agricultural subsidies caused prices to rise and created increased food insecurity”.

“Left to its own devices, the market will not bring about serious economic growth in Africa: indeed, open the borders and the export of primary products have not led to sustained development anywhere in the world” (Chabal & Daloz, 1999).

“In response to poor economic performance and insecurity, there has been substantial capital flight, together with unmanageable external debt over-hang, which currently is equal to 80% of Africa’s GDP” (Mule, 2003).

The net result of SAP policies in Sub-Saharan Africa was a major decline in GDP. Between 1960 and 1980, per capita GDP increased by 36%, while between 1980 and 1998, during the period of structural adjustment (free-market

fundamentalism), the per capita GDP fell by 15% in SSA, showing SAP policies to be bogus (Sogge, 2002). Zack-Williams (2002 *In: Zack-Williams, et al., 2002*) estimates that Sub-Saharan Africa's per capita GDP fell from US\$ 671 in 1975 to US\$ 245 by 1997. This “shock therapy” resulted in income inequalities with redistribution of wealth upwards, heightening the gap between the poor and the rich elite, along with cuts in social services. The winners were the industrialists and the upper 10-20% income bracket, while the losers were the bottom 80% on the socio-economic scale – the uneducated impoverished masses (Sogge, 2002). UNECA (2004) estimates for African countries, which are not oil exporters, the cumulative terms of trade losses in 1970-97, represented almost 120% of GDP, a massive and persistent drain of purchasing power.

Trade Agreements Linked to SAP, to the Benefit of Whom?

“When the universal result is low resource export prices and increased poverty, the IMF/World Bank/GATT/NAFTA/WTO/MAI/military colossus can hardly claim their intent was to develop those countries. Just as the proto-mercantilist cities of the Middle Ages controlled the countryside’s production and trade to lay claim to their wealth, mercantilist and neo-mercantilist empires claimed the wealth of their colonies (their countryside), the developing countries are today the ‘dependent countryside’ producing cheap resources for emerging corporate mercantilists” (Smith, 2001).

Transnational Corporations (TNCs) from the world's richest countries, which control both the World Bank and IMF, profit from the steady supply of cheap commodities and the investment opportunities that SAPs guarantee. Privatization of state enterprises, a central theme in structural adjustment, has allowed TNCs to expand their activities across the south, just as public sector redundancies have provided a ready pool of unemployed people desperate for work at any rates (Hilary, 2002).

In southern Africa, TNCs market the food and control our food systems. Altria, the Philip Morris group of companies, which includes Kraft and Miller, made over US\$ 8 billion in profits last year (Fortune Magazine Online, 2002 *In: Patel & Delwiche, 2002*). In the past six months, Switzerland-based Nestlé S.A. posted profits of a little under US\$ 4 billion on sales of US\$ 29 billion (Nestlé S.A., 2002 *In: Patel & Delwiche, 2002*). To put this in perspective, the entire gross domestic product for all six countries in the famine region was a little over US\$ 20 billion in 2001 (World Bank, 1999 *In: Patel & Delwiche, 2002*). These corporations depend on cheap inputs (e.g., cocoa), such as the agricultural products grown in the Third World, to make their food processing profitable. Cheap labor and lower environmental standards in developing countries add to these profits.

NAFTA Free-Trade Agreement, a Benefit to Whom – Lessons for Africa

The North American Free-Trade Agreement (NAFTA) has transformed Mexico into a cheap source of manufactured goods, with wages 10% (1/10th) of the U.S. The decrease in wages was hailed as an inducement to foreign investment, along with labor repression and lax enforcement of environmental restrictions. “Free-trade agreements” extend control over the global economy to the benefit of a few, while impoverishing the masses (Chomsky, 1999). NAFTA is exactly what AGOA and NEPAD, (to be discussed in the next chapter) should not be – another way of maximizing profits at the expense of the worker and the environment. Yet America wonders why illegal aliens are flocking across its borders, in turn providing cheap illegal farm, construction and other manual labor that the middleclass will no longer undertake – thus benefiting the private sector on both sides of the border. In essence, another form of subsidy – cheap labor and no environmental controls – has been brought about by intervention of the U.S. Government on the behalf of the American private sector, resulting in good capitalism – a maximization of the profits, regardless of the consequences to

people or the environment. Attempts are being made to deal with environmental issues (see Chapter 13, Section 13.13.4, NAFTA, Maquiladora and the Environment, Lessons for Sub-Saharan Africa)

Meanwhile, NAFTA has been used to subordinate workers in America, with actual or threatened exports of jobs overseas, when increased salaries or worker benefits are demanded. Real wages have fallen since the 1960s for production and non-supervisory workers, and concern exists that “free-trade” deals like NAFTA, will harm not only local workers, but lock the United States into a low-wage, low-productivity, high profit (for the corporate elite) future, with increasing polarization between the rich and poor, with possible social disintegration (Chomsky, 1999). Africa beware!

12.4 STRUCTURAL ADJUSTMENT FOOD PRODUCTION AND LAND/RESOURCE DEGRADATION IN SUB-SAHARAN AFRICA

Hypocritical structural adjustment policies, often a prerequisite to foreign aid, have forced African countries to cut agricultural subsidies (McCann, 1999), as well as support to agricultural research and extension services (Mule, 2003; Roman, 2003). Meanwhile, these subsidies continue in America and Europe, providing a comparative advantage for Western farmers over African farmers. This will also be discussed in greater detail in Section 12.4.1.1, Structural adjustment and agriculture.

At the beginning of the 1980s, African states had a very clear idea of what their economies and societies needed in order to flourish. In the Lagos Plan of Action (OAU, 1981 *In:* Patel & Delwiche, 2002), Heads of State called for a type of economic growth disconnected from the ever-changing world market, relying on import-substitution policies, food sovereignty and trade within Africa and,

critically, a reduction in the level of external indebtedness that was systematically siphoning value out of Africa.

The World Bank disagreed, insisting in its Berg Report (World Bank, 1981 *In: Patel & Delwiche, 2002*) that State interference in the smooth functioning of the market was precisely the cause of low levels of growth (Arrighi, 2002), even though America and Europe were, and are, doing just that (e.g., subsidizing farmers, protecting fragile markets with trade tariffs and setting import quotas), while purporting to support “free-trade”. As most African governments were buried in debt, their futures mortgaged on declining commodity prices, the Bank’s plan prevailed (Danaher & Riak, 1995). Under the Bank’s regime, African nations were forced to produce foreign exchange-earning (i.e., cash crops) to pay off increasing debt and found themselves importing more and more food. In a perfect, stable market, this would not pose a problem: the farmer would grow an export crop in which she or he has a comparative advantage and will use the cash to buy imported food, goods and services. In the real world, however, this model increases farming communities’ vulnerability to a number of risks (Patel & Delwiche, 2002):

- **Commodity Price Fluctuations and Decline:** Primary commodity prices have been falling consistently for 30 years. In part, the World Bank is to blame; its structural adjustment programs enforced the export of a few key commodities, “in the raw” in high demand in the North, putting southern countries on the receiving end of volatile and decreasing prices for their exports (Peters, 2000 *In: Patel & Delwiche, 2002*).
- **Currency Fluctuations:** Even the most efficient farmers are unable to buy food on the world market if their currency is undervalued. Yet this is what every economic model suggests will happen when countries follow World

Bank recommendations to liberalize exchange markets (Greenhill & Pettifor, 2002 *In: Patel & Delwiche, 2002*).

12.4.1 Impacts of Structural Adjustment on Sub-Saharan Africa's Natural Resources

12.4.1.1 Structural adjustment and agriculture

The Bank's prescriptive approach focused solely on domestic policies targeting agricultural policies, macro-economic policies and the government's role in the economy. The rejuvenation of the agricultural sector was a core concern of structural adjustment programs, especially price reforms, which attempted to stop the underpayment of African farmers by coffee, maize and other "control boards", or by keeping prices artificially low in order to keep the urban masses happy, their primary supporters. Structural adjustment programs mandated abolishing price controls through government agricultural marketing boards and liberalizing exchange rates in order to allow farmers to earn a larger share of world prices for their exports. Governments were also required to improve roads and extension services (neither possible under SAP) and to reduce interference in seed and fertilizer markets, as well as in credit schemes (Martin & O'Meara, 1995). It was assumed that higher prices and lower taxation of the farmer would stimulate production.

It would appear that this was based primarily on economic considerations, with little regard for structural limitations. Limitations on agricultural production in Africa include physical and chemical limitations of the soils (see Chapter 5, Section 5.5, LAND USE POTENTIAL AND CONSTRAINTS IN SUB-SAHARAN AFRICA). This is especially true in the savanna lands, where a majority of the people live and which are not conducive to permanent commercial

agriculture. These lands experience low rainfall, exhibit poor physical and chemical characteristics, have declining land available/person to cultivate, an uneducated poorly nourished populace, and often very repressive climates and disease, unlike more temperate climate zones; in addition to inadequate market infrastructure, such as roads and storage facilities and in general, the already stressed ecosystems on which an over-populated continent was trying to farm (see Chapter 5) (Martin & O'Meara, 1995). Thus, the declining “terms of trade” for primary products and ecological constraints on much of Africa's soils make great strides in agricultural production questionable (see Section, 12.3.4.4, Trade and structural adjustment policies [SAP], Declining “Terms Of Trade” Associated With Structural Adjustment). The biggest strides are likely to be made in developing industries in Sub-Saharan Africa that transform these products prior to export and for local/regional consumption, as opposed to exporting them raw and having to buy them back transformed.

SAP policies have also resulted in the best agricultural land being used for the growing cash crops to raise hard currency to service unpayable debts, while farmers trying to grow food crops are often left with land virtually unfit for agriculture, or they chose the best land for cash crops and apply inputs, while choosing marginal land for agriculture, using little or no inputs with the strong risk of nutrient mining and soil degradation (ANON, 1998; Copeland, 2000). Madeley (2002) raises concern that structural adjustment policies (SAPs) which encourage production of export crops by small farmers, convert the best land, formerly in food production, into commercial crops. Food production then takes place on the more marginal lands, thus risking to increase food insecurity, and increasing mal- under-nutrition as money from commercial crops is often used for things other than food, such as school fees and health care, since SAPs eliminated these government sponsored programs. SAPs, which push increased production on a global level, also result in declining commodity prices and thus, do not mean that the farmer's income will necessarily increase significantly even though his

production increases (see Section 12.1.2, Today, Raw Products Continue Flowing and 12.2.5, ILO Demands an End to Subsidies and Trade Barriers). As an example, about 70% of coffee growers are small-scale farmers globally. In 2001, the world price of coffee reached its lowest price in 30 years, well below the cost of production (Madeley, 2002).

At the same time, SAP requirements to liberalize their economy and open their markets allow the USA and EU, with a glut of agricultural produce, to find needy markets in Sub-Saharan Africa and the rest of the developing world for this produce where it is sold below the normal prices. This undercuts local small farmers who, unable to compete with the agro-industry of the U.S. and EU, are forced out of business (ANON, 1998; Copeland, 2000). This would be fine if the cash crops were transformed in Africa, but they are generally exported raw and the consequences, as described, make commodity dependent countries vulnerable to market flooding and decreased prices, for both local and export commodities.

12.4.2 Structural Adjustment, a Disincentive to Sustainable Resource Management

“Serious environmental destruction began in many Third World countries in the 1970s and 1980s. Easy money was available from industrialized countries for ‘development’. Much of it was spent on large dam projects (see Chapter 7), power plants and charcoal driven industries. These usually didn’t help the poor, and did damage the environment” (Jubilee Plus, 2002).

“IMF and Bank-supported adjustment policies have been among the major contributors to environmental destruction in the Third World. By pushing countries to increase their foreign exchange to service their foreign debt, structural adjustment programs have forced them to super-exploit their exportable resources” (Bello & Cunningham, 1994),

milking the earth's resources for the hard cash they brought in, while cutting back on environmental conservation programs (Jubilee Plus, 2002). The “export-led growth” model on which the IMF and the World Bank insist, is a purely extractive one, involving more the “mining” than the management - much less the conservation - of resources (e.g., timber, mining, fishing, soils) (Bello & Cunningham, 1994; Welch, 2001; Smith, 2001). In other words,

“Depressed commodity prices have meant that many countries dependent on primary exports have been forced to increase production in attempts to compensate for falling prices. This has led to a situation of more land resources being used for export crop production, reducing land available for domestic food cultivation, and increasing deforestation of non-agricultural land” (Tan, 2002),

undermining peasant agriculture, while reinforcing export-oriented agribusiness and its dependence on dangerous agrochemicals if used improperly (Bello & Cunningham, 1994; Welch, 2001). The net result has been:

- Allowing over-fishing of their waters so that fish stocks are damaged and local fishing economies and cultures are often degraded (see Chapter 4);
- Allowing multinational companies logging rights to their forests, destroying the lifestyle of those who live there (see Chapter 11, Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the “Dobi Dobi”, More Parks and Protected Areas); and
- Chopping down forests to make room for beef cattle grazing or crop farming (see Chapter 5, Sections, 5.9.4, Forest Losses Linked to Over-Population and Commercial Agricultural and Land Scarcity).

As noted under Section 12.2.4.4 (Cotton subsidies and protected markets, U.S. Cotton Subsidies and Africa, Cultivating Poverty), one potential consequence of getting less for producing more is soil mining, and misuse of fertilizers and pesticides to get more out of the ground. This may even result in expanding

production onto more land, even marginal lands; often into key wildlife or livestock habitat in savannas, as a means of increasing overall yields. The net result of declining economies linked to structural adjustment has also been an increase in poaching, as the unemployed return from the cities to their rural roots and/or rural people begin searching for alternative incomes to supplement that lost from devaluating currencies, loss of government support, etc. linked to structural adjustment. Examples of such activities are contained in:

- Chapter 5, Section 5.12.1.2, Green revolution technologies, Green Revolution, Zimbabwe;
- Chapter 9, Section 9.7.2, Reluctance to Devolve Control and Ownership of Resources to Landholders;
- Chapter 9, Section 9.7.8.3, Need for non-rural livelihood alternatives through industrialization;
- Chapter 9, Section 9.8.4, Devolution and CAMPFIRE, Zimbabwe;
- Chapter 10, Section 10.3.2.3, Politics of despair;
- Chapter 10, Section 10.5, RHINO, TRADE OR TRADE CONTROL, WHAT'S BEST FOR CONSERVATION;
- Chapter 11, Section 11.11.6.2, Modern conservation and the Baka Pygmy
- Section 12.4.3.2, Impacts of structural adjustment on fertilizer use and intensification in Senegal's groundnut basin;
- Section 12.4.3.3, Impacts of structural adjustment on maize production and fertilizer use in Zambia and Zimbabwe;
- Section, 12.4.4.2 Impacts of structural adjustment on Central Ghana cash crop economies, fallow and virgin forests;
- Section, 12.4.4.3, Impacts of structural adjustment on sustainable rice production in Madagascar;
- Section, 12.4.4.4, Impacts of structural adjustment on land hunger in Zimbabwe; and

- Section 12.7.1.12, Impacts of structural adjustment on the wildlife and parks estate in Zimbabwe

12.4.3 Declining Fertilizer Use in Sub-Saharan Africa

The Green Revolution, through a combination of high yielding wheat and rice, fertilizer and irrigation, resulted in a doubling of yields/ha in the Far East. However, lack of an economically enabling environment in Sub-Saharan Africa constrained a take-off of enhanced fertilizer use, even though on-farm trials demonstrated similar results as in Asia; the increased yield (kg)/ha/kg of nutrients added being 8 kg/ha for cereals and up to 30 kg/ha for root and tuber crops in parts of Sub-Saharan Africa. However, while global consumption of fertilizer grew from 31 million tons in 1961 to 135 million tons in 1997, averaging 90 kg/ha of cropped land, Sub-Saharan Africa averaged only 9-10 kg fertilizer/ha of arable land (Winterbottom & Neme, 1997; Reardon, Barrett, Kelly & Savadogo, 1999; Gruhn, Goletti & Yudelman, 2000; Dudal, 2002 *In:* Vanlauwe, Diels, Singinga & Merckx, 2002; NEPAD, 2002) and many do not have either access to fertilizer stocks or cash/credit to purchase fertilizers (Winterbottom & Neme, 1997). FAO (2002) estimates that small farmers in SSA applied five kg/ha/year of fertilizer. Similarly, NEPAD (2002) estimates that fertilizer use in all of Africa as a whole, is only 21 kg (nutrients)/ha of arable land/year, and only 9 kg/ha arable land in Sub-Saharan Africa. Outside Africa, as much as 75% of crop-yield increases world-wide since the mid-1960s are directly or indirectly attributable to fertilizer use (Reardon, *et al.*, 1999).

By comparison, global fertilizer use in the rest of the World reached approximately optimal management levels (Gruhn, *et al.*, 2000; NEPAD, 2002). In 1997, an average of 206 kg/ha of fertilizers were used in industrialized countries, 80 kg/ha in the Near East and North Africa, 73 kg/ha in Latin America,

79 kg/ha in South Asia and 147 kg/ha in East Asia. The 9 kg/ha reflects large extensive areas in Africa using no fertilizer, with intensively managed commercial areas using the most fertilizer. The net result has been nutrient mining and a declining per capita food production in Sub-Saharan Africa (Dudal, 2002 *In: Vanlauwe, et al., 2002*).

“The use of chemical fertilizers in Sub-Saharan Africa has hovered at only 2 million metric tons (per year) since 1980. Most of the fertilizer is used in only four countries: South Africa (832,000 tons), Nigeria (394,000), Zimbabwe (171,000) and Kenya (134,000). Application rates are among the highest in Mauritius (261 kg/ha of arable land), Zimbabwe (60 kg/ha) and Kenya (48 kg/ha). The only other SSA countries with significant rates of use of fertilizer are Togo, Malawi, Tanzania, Lesotho, Nigeria, Congo and Cote d’Ivoire — generally coastal countries or with a concentration of high-input farming for export markets” (Winterbottom & Neme, 1997).

In many cases, on the marginal agricultural lands constituting approximately 70% of SSA (see Chapter 5, Section 5.5.1, Land Use Potential for Rainfed Agriculture in Africa), the cost of inputs such as commercial fertilizer versus increases in yields, may not be cost-effective. As marginal land that is already low in productivity becomes degraded, it is cheaper to bring additional land into production rather than invest in maintaining or improving the long-term productivity of cultivated land. This is not necessarily a bad land use practice, particularly if the cropland is simply being abandoned temporarily and left fallow until its productivity is restored, as discussed in Chapter 2. However, as discussed in Chapter 5, fallow periods are disappearing across the continent and soils are rapidly degrading. In simple terms, there may not be any easy high tech solutions to these marginal areas, under high human population pressure, to produce, that worked well under traditional management when under low human populations.

It is believed that until the 1960s, more than adequate land was available for fallow agriculture, allowing any expansion in agricultural production to occur through opening up new land, which was cheaper for the farmer than purchasing fertilizers. This resulted in an expansion from 120 to 154 million hectares (34 million hectares converted) in arable land between 1961 and 1997 in Sub-Saharan Africa, a 28% increase in land conversion (Dudal, 2002 *In: Vanlauwe, et al.*, 2002). Gruhn, *et al.* (2000) estimate an increase of 14 million hectares of land converted in Sub-Saharan Africa to agriculture from 1973-1988.

This level of expansion can no longer continue without jeopardizing many of Africa's unique natural areas and without going into areas where other environmental constraints inhibit production (e.g. soil moisture, soil structure, soil depth, acidity, alkalinity, etc.). The only hope for increasing food production will be through various ways of increasing soil fertility, optimizing the use of the most productive lands and possibly using improved seed varieties (see Chapter 5, Section 5.12.1, Technological Solutions to Africa Food Crisis and Land Degradation).

“FAO estimates show that between 1995/7 and 2030 about 75% of the projected growth in crop production in Sub-Saharan Africa will come from intensification in the form of yield increases (62%) and higher cropping intensities (13%), with the remaining 25% coming from arable land expansion” (NEPAD, 2002).

In other words, if Sub-Saharan Africa does not move towards achieving the FAO scenario, it will be in trouble as a result of increasingly poor crop yields, degraded soils, encroachment on important natural systems and increasing dependency on food aid that may not be forthcoming if global grain deficits continue (see Chapter 5, Section 5.3.1.2, Keeping up with future demand – global deficits of the 21st century). FAO (2002) is concerned that by 2020-2030, climate change could depress cereal production in Africa by 2-3%, affecting 10 million people.

Intensification, using improved seeds and increased fertilizer use, will be needed to compensate.

Land tenure, positive cost/benefit ratios of yield to fertilizer input, product price, access to markets (e.g., infrastructure) to sell surpluses and credit are other incentives farmers will need to induce them to adopt fertilizers and other techniques. Also, farmers need to be sensitized to the inter-generational benefits of maintaining soil fertility, even though short-term gains can be obtained from nutrient mining (Dudal, 2002 *In: Vanlauwe, et al., 2002*).

However, in much of Africa input intensive technologies are not economical when farmers must pay three to five times the world market price for their fertilizer and receive only 30 to 60% of the market value for their products (Hazell, 2001) (see Chapter 5, Section 5.12.1, Technological Solutions to Africa Food Crisis and Land Degradation).

Regardless of the type of crop produced and despite the cost of fertilizer, three factors appear to be key in determining whether farmers use commercial fertilizers. First, fertilizers should help farmers obtain sufficiently high yields. Second, farmers should be near major towns, where agricultural input distributors are located, in order to benefit from lower prices for inputs and higher prices and lower marketing costs for outputs. Third, farmers should be able to store at least part of their output, so that they can take advantage of higher out-of-season prices (Donovan & Casey, 1998 *In: Gruhn, et al., 2000*). When these three factors are in place, farmers are more willing and able to use fertilizer to increase income and sustain soils for the long term (Gruhn, *et al.*, 2000). Thus, very often the cost of inputs cannot be justified compared to the increase in crop yield, given local and world market prices and/or the risks of drought, locusts and other pests/factors significantly reducing his/her yield. Often, the small farmer risks going further into debt from using these inputs.

Additionally, fertilizers alone cannot maintain the soil productivity and if continuous cultivation is to be adopted, then new ways of maintaining soil organic matter must be found if the fallow is to be reduced or abandoned and accelerated erosion is to be checked (de Vos, 1975). Potential solutions to intensification are discussed in Chapter 5, Section 5.12, THE WAY FORWARD.

12.4.3.1 Impacts of structural adjustment on fertilizer use

Structural adjustment policies (SAPs), including declining subsidies for fertilizers and pesticides, are a major constraint to declining application of these inputs in Sub-Saharan Africa. Likewise, increasing interest rates, as part of structural adjustment, has made it difficult for small farmers to find affordable credit to purchase inputs (e.g., fertilizer, pesticides and seeds) (Stiglitz, 2002). Other SAP policies, such as currency devaluation and encouraging mono-culture export economies of raw products, resulting in market flooding and commodity price declines, make it often difficult and unaffordable for small farmers to purchase fertilizers.

Nitrogen-to-maize price ratios in Ghana, Tanzania and Zambia were substantially higher during the 1990s, after the SAPs were instituted, than during the 1980s, when price controls and subsidies were in effect (Heiney & Mwangi, 1997 *In: Gruhn, et al.*, 2000). The SAPs and higher input prices have consequently reduced the profitability of using fertilizer to increase the production of food grains for domestic consumption (Gruhn, *et al.*, 2000).

Farmers growing export crops have however, benefited from the restructuring of currencies, and increased their fertilizer use (Gruhn, *et al.*, 2000). Only profitable, commercial farms (even if small-scale and of food or nonfood products) induce investment by African farmers in inorganic fertilizer use, animal traction, organic matter use and soil conservation investments (Reardon, *et al.*, 1999):

- **In Burkina Faso**, farmers use 13 times more manure on cotton and maize, both cash crops, than on sorghum and millet, the main subsistence food grains;
- **In Zimbabwe**, farmers mainly use improved tillage practices and fertilizers where there are profitable cash crops;
- **In Northern Ghana**, fertilizer use is low on average and very variable over farms, but tends to be applied only to crops-for-sale (hybrid maize, cotton and rice) and not on subsistence-food crops such as sorghum, millet and cowpea; and
- **In the highlands of Tanzania and Rwanda**, farmers confine fertilizer and soil conservation practices to cash crops.

However, given the vast acreage devoted to subsistence food crops compared with the modest area under export and/or cash crops, the devaluation of currencies and the reduction of fertilizer subsidies on balance have been detrimental to increased application of imported fertilizers (Gruhn, *et al.*, 2000). Since commercially viable land makes up only about 7-11% of the African continent, maybe 27% of SSA, much of this being constrained by over-population or other land use priorities (e.g., dispersal areas for wildlife), there are few areas in SSA that can support these expensive inputs without subsidies, which most African countries cannot afford and which many macro-economic policies dissuade.

12.4.3.2 Impacts of structural adjustment on fertilizer use and intensification in Senegal's groundnut basin

Seed, fertilizer, credit subsidies and animal traction equipment programs greatly reduced input and equipment costs to peanut farmers in the Senegalese Peanut Basin from the 1960s to the early 1980s, prior to structural adjustment (Kelly, Diagana, Reardon, Gaye & Crawford, 1996; Reardon, *et al.*, 1999). Under this *Program Agricole*, fertilizers were subsidized from 40-60% (Kelly, *et al.*, 1996). This fostered sustainable intensification as input use/ha climbed sharply in the production of peanuts sold as a cash crop in a guaranteed export market (Reardon, *et al.*, 1999).

“Production increased from 892,000 tons in 1960/61 to 1,168,000 tons in 1965/66, and marketed peanuts went from 786,000 tons to 1,089,000 tons - meeting the established target of increasing output by 25%. Much of the gain was through increased planting (1,114,000 ha in 1965 versus 977,000 ha in 1960), but increased productivity per hectare was also evident (1,007 kg/ha in 1965 versus 913 kg/ha in 1960)...Although Senegal's fertilizer consumption rate was one of the highest in Africa in the mid-1970s, it represented an average application of only 11 kg/ha” (Kelly, *et al.*, 1996).

However, as a policy pursued since colonialism, little emphasis was placed on increasing cereal production, with deficits being made up by imports of rice from Asia. Thus, farmers grew cereals for personal consumption, and with little or no market/marketing saw little value in wasting fertilizers. Kelly, *et al.* (1996) state that

“aggregate millet production increased steadily from 392,000 tons in 1960/61 to 514,000 tons in 1964/65. This increase was due to expansion of the area cultivated, as yields/ha declined from 574 kilograms in 1960/61 to 508 kilograms in 1964/65”.

Liberalization (Structural Adjustment) brought the removal of those government subsidies and guarantees. This led to a relative de-intensification of peanut production and a precipitous decline in inorganic fertilizer use. This is a response, in part, to decreases in expected profitability of improved input use, due to changes in subsidy and financial services policies in the 1980s. It also reflects a risky and deteriorating physical environment, the result of low and variable rainfall, plus decades of continuous peanut/millet cultivation with limited use of fallow, organic matter and chemical fertilizers (Reardon, *et al.*, 1999).

“Fertilizer use dropped from 74 to 44 thousand metric tons between 1980/81 and 1981/82. Precipitous drops continued to occur throughout the 1980s. A reduction in the fertilizer subsidy almost doubled the farm-gate fertilizer price between 1982 and 1983, further exacerbating the problem. Use fell from 41,000 to 27,000 tons between 1984 and 1985, when the government imposed a *retenue* system, taxing farmers when they marketed peanuts to pay for fertilizer that would be delivered for the following season” (Kelly, *et al.*, 1996).

Following the sharp drop in fertilizer consumption during the 1980s, farmers began increasing peanut seeding densities to improve yields and incomes, at least in the short-term, and to compensate for the declining soil quality that they believed was slowing down the growth of peanut ground cover and, therefore, causing weed problems. Survey data show that many farmers are using more than twice the recommended quantity of seed/ha. Although raising peanut seed density appears to be a logical short-term solution, agronomic research suggests that it is not a sustainable practice. Without supplementary fertilizer and organic matter, increased seeding densities not only lead to further soil mining, but also undermine seed quality over time (Reardon, *et al.*, 1999).

Diagana and Kelly (1996) found that peanut production was the most profitable way to use agricultural land and labor in the Groundnut Basin of Senegal, after the currency devaluation (50/1 to 100/1 CFA/French Franc) as a result of structural adjustment. Households would pursue peanut mono-cropping were it not for food security and land rotation constraints – the need to maintain 50% of their land in millet for food security, rotating with nitrogen fixing peanuts. Soil degradation was projected to continue and perhaps accelerate due to the increased profitability of peanuts because chemical fertilizers are not economically competitive with the soil-mining practices of increasing seeding densities. Thus, although the devaluation increased gross margins and nominal income in the short-run, it also increased the negative impact of agriculture on the environment by encouraging farmers to raise peanut production without adopting technologies that would return nutrients to the soil, guard against soil erosion and improve the quality of their seed stock.

12.4.3.3 Impacts of structural adjustment on maize production and fertilizer use in Zimbabwe

At independence in 1980, Zimbabwe inherited a dual agrarian structure of 6,500 commercial “white” farmers producing 90% of the maize and cotton and 99% of the tobacco, while 700,000 smallholders produced the remainder (Eicher, 1990 *In: Eicher & Staatz, 1990*).

Before the structural adjustment programs of the second half of the 1980s and the first half of the 1990s, governments had developed rural feeder roads and depots to provide reliable market access, subsidized farm credit programs, subsidized fertilizer and seed inputs, and expanded extension services to smallholders - conditions that in the early 1980s, provided the incentive and capacity for smallholders to adopt long-available hybrid maize varieties. It is important to

note that it took 28 years of research in Zimbabwe to develop a hybrid variety of maize (SR-52) for commercial farmers in 1960 and to develop shorter season (110-120 day) hybrid varieties for smallholders in the 1970s (Eicher, 1990 *In: Eicher & Staatz, 1990*). By 1990, all commercial farmers, as well as 80% of the smallholders, used plant hybrids, the highest percentage in Africa (Eicher, 1990 *In: Eicher & Staatz, 1990*).

This technology was essential to “sustainable agriculture intensification” among smallholders in the most environmentally fragile areas of the country and there was a boom, a local Green Revolution. However, Zimbabwe could not afford the public expenditures demanded by depot provision and subsidies for seed, fertilizer and financial services, and under pressure from International Finance Institutions (IFIs) concerned about fiscal deficits, the system was dismantled in the second half of the 1980s and early 1990s.

From 1979-1985, Zimbabwean smallholders were producing 30% of the marketed surplus maize (tripling their maize production), up from 10% in 1980. They sold 60% of this increase in maize output. However, 70% of this increase came from only 10% of the smallholders who had the best watered land in high rainfall areas (Eicher, 1990 *In: Eicher & Staatz, 1990*).

Since structural adjustment, smallholders have shifted away from fertilizer use on maize toward “labor-led” intensification that threatens soil fertility.

12.4.4 Impacts of Structural Adjustment on Peasant Production Systems

12.4.4.1 Impacts of structural adjustment on peasant farmers along the Senegal River

Under the second phase of Senegal's structural adjustment program linked to the *Nouveau Politique Agricole* (New Agricultural Policy), what at first appeared in the interest of the small farmer, turned out to support a private sector of local politicians and civil servants through SAED (*Société d'Aménagement et d'Exploitation des Terres du Delta du Fleuve Sénégal*), the body that controlled the construction of irrigated perimeters along the Senegal River. Between 1987 and 1992, 20,000 hectares were put into operation in the Delta, the most successful schemes going to SAED cadres with access to land and financial support. However, due to many factors, especially soil salinization from hastily built and ill conceived perimeters and the cost of pumped irrigation versus the lower cost of imported rice, loan repayments decreased between 1990 and 1993. At first people decreased the area under irrigation and then started giving up all together. USAID consultants tried to make entrepreneurial farmers out of cinema owners, etc. instead of working with small farmers. This failed and not one hectare was irrigated. Small farmers, through their federation, sought funding to rehabilitate irrigation perimeters. Structural adjustment resulted in the loss of any agricultural subsidies. Farmers reduced inputs at the cost of lower yields, emigrated in search of work, or took cash advances from wealthier people. In essence, they became share-croppers, allowing outsiders to invest in irrigation without having been granted land. In the end, many sold their land or simply walked away. The State could no longer play the role of the private sector and yet the small farmer, who should have played an important role, did not count (Adams, 2000) (see Chapter 5, Section 5.12.1.3, Irrigation potential, Major

Constraints to Irrigation as an Alternative to Production and Chapter 7, Section 7.10.5.1, Senegal River).

In fact, because of declining food production, as a result of the slow pace of irrigation expansion and the rarity of useful floods since the Manantali and Diama dams were finished a decade ago, there has been an out migration by young males. In addition, households depend on remittances to buy food they no longer produce, there is an increase in malnutrition, especially among women, children and ethnic minorities, and increased vulnerability to respiratory and parasitic diseases from declining nutrition (Finger & Teodoru, 2003).

René Dumont (1966) described tenant farming as inhumane exploitation. Because of the poor profit margin to the tenant, the majority of profits often go to absentee elite living in the city. Thus, there is little or no incentive to reinvest capital back into the necessary infrastructure and technologies (e.g., soil conservation, fertilizers, & drainage) to maintain the productivity of the land, which is thus mined for short-term benefits by the impoverished tenant farmer. René Dumont (1966) considered programs like SAED as a “crime against the nation”.

12.4.4.2 Impacts of structural adjustment on Central Ghana cash crop economies, fallow and virgin forests

“In the future, the need for forest biodiversity conservation will stem not from human action of the past but from the imperatives of the world economy of development in the present” (McCann, 1999).

From 1880 to 1920, Central Ghana entered into the global economy, first supplying palm oil by taking wild seeds and creating plantations and once this market was saturated, producing cocoa. Cocoa linked small farmers into the global cash economy. The addition of tree crops into the fallow system mimicked

the forest through the creation of a shade canopy (Amanor, 1994 *In:* McCann, 1999). However, the process resulted in the systematic cultivation of coca trees in the “virgin forest” (Hill, 1963 *In:* McCann, 1999). Clearing was identical to the classic fallow sequence: 1) Clearing and burning, 2) Three years of maize, yams and vegetables, 3) Shade crops of cassava, coco yam and plantain to protect the cocoa seedlings and 4) By year five, the cocoa trees were mature and the next section of forest was harvested. Rail and the motorized transport resulted in Ghana becoming the largest cocoa producer in the World, going from 500 tons in 1900 to 200,000 tons by 1930 (McCann, 1999).

Due to declining cocoa production, in the final quarter of the 20th century of - 71.1% (ILO, 2004), farmers turned to maize. Between 1975 and 1991, maize production increased from 319,700 ha to 610,400 ha; a 125%⁴⁹⁰ increase in area and a 230%⁴⁹¹ increase in yield (1 to 1.5 tons/ha) (McCann, 1999). About 67% of the farmers used maize as a cash crop in addition to feeding the household. In the 1990s, the Sasakawa/Global 2000 project introduced maize as part of a “Green Revolution” package, using hybrid seeds, fertilizer, herbicides, no-till and intercropping with legumes. Concern exists that relying completely on hybrids, will result in the loss of local varieties of maize and associated genetic germ plasm. This requires placing fields under permanent cultivation and using expensive inputs that must be subsidized by governments. The loss of farm subsidies under the World Bank Structural Adjustment program is encouraging farmers to continue clearing new lands in order to maintain enough fertility to produce the high yields of these hybrid varieties. In addition, this high yielding hybrid maize, unlike traditional maize, requires sunlight and complete elimination of forest cover – both primary and secondary. Cocoa can grow within a forest canopy. Concern is raised that with growing urban populations and the demand for food in the 21st century, the spread of this kind of maize farming spells dire consequences

⁴⁹⁰ Appears to be 91 %.

⁴⁹¹ Appears to be 50 % increase.

for both the forest fallow cultivation system and the forest canopy (McCann, 1999).

12.4.4.3 Impacts of structural adjustment on sustainable rice production in Madagascar

Until economic reforms in the 1980s, the state-controlled rice prices were kept low and stable. With reforms, prices were decontrolled, rose and became more volatile, due in part to sharp exchange rate devaluation and in part to the weakening state of private marketing infrastructure and financial markets. Fiscal cutbacks effectively ended rural road maintenance and reduction in public credit further increased price volatility and reduced the access of smallholders to cash for inputs. The increased mean and variance of rice prices induced Malagasy rice producers – most of whom were net rice buyers - to stimulate output by expanding the area in cultivation through further shortening of fallow periods and extensification into fragile forest margins. Moreover, cash constraints and the effects of devaluation on imported inputs reduced the traditionally low fertilizer use even further, thereby further de-intensifying production and forcing extensification (Reardon, *et al.*, 1999).

12.4.4.4 Impacts of structural adjustment on land hunger in Zimbabwe

Many Zimbabweans feel that the collapse of industrialization, strongly linked to World Bank and International Monetary Fund (IMF) Policies, resulted in massive retrenchments in urban centers, forcing people back onto the land (Murphree, 2001), exasperating an already existing land hunger in the over-crowded homelands. In a book written by Zimbabwean economists on the history of industrialization in this country, they explain the worst thing that has happened to

African countries is “Structural Adjustment” of the IMF/World Bank (Milambo, Pangeti & Phimister, 2000).

12.4.4.5 Impacts of structural adjustment on maize production in Malawi

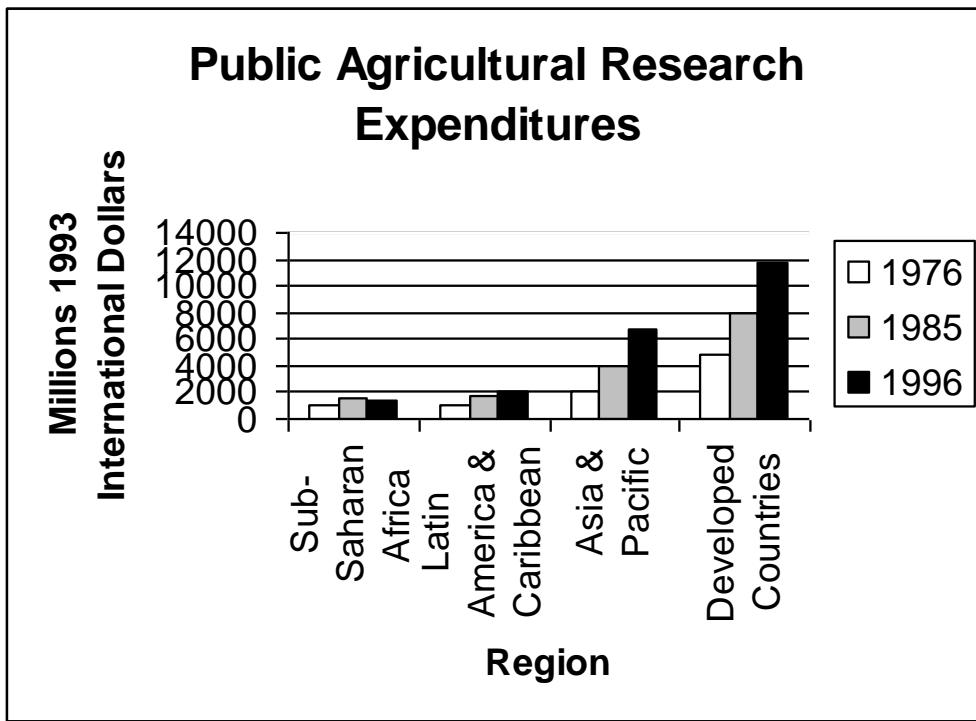

The IMF/World Bank Structural adjustment program advised the Malawian government to reduce free seed and fertilizer inputs in 1998, resulting in a decline in maize production from 2.4 million tons/year to 1.4 million tons/year. At the same time, the body that provided inputs and bought maize from farmers, the Agricultural Development and Marketing Corporation (ADMARC), was privatized. Thus, many farmers could not afford these inputs, a major reason production declined. The international donors, including the IMF, advised drawing down the National Strategic Grain Reserves from 167,000 tons to 30-60,000 tons, enough to last for a couple of months in an emergency prior to the arrival of international food aid. Somehow, the entire reserve was sold, flooding the local market, in turn resulting in a major decline in maize prices. This reduced incomes to local farmers and reduced their ability to buy seed and fertilizer. Because of structural adjustment disallowing government controls of food prices and due to shortfalls, maize prices went up for the population at large, becoming unaffordable and affecting diets. Cut backs in conditionalities reduced the government’s ability to plan through the national surveillance system and react to disasters. It was alleged that a small cartel of government elite manipulated food prices to their advantage. This was exacerbated by drought in 2001 and 2002 (Christian Aid, 2002).

12.4.5 Decline in Research and Extension as a Result of Structural Adjustment

Because of structural adjustment programs, there has been public under-investment in agriculture, from basic research to subsidization of inputs. In most of the African countries, public expenditures on agriculture, both capital and recurrent, amount to less than 10% of total government budget. This is a low rate of investment considering that for the majority of countries, agriculture accounts for more than 33% of GDP (Mule, 2003), while others say 20% of the GDP, (Maxwell, 2001 *In: Devereux & Maxwell, 2001; Roman, 2003*).

World Bank lending to agricultural support in Africa declined from almost 38-40% of its total lending in 1978, to 10% in 1996 and 7-10% in 2000 (UNECA, 2003; Roman, 2003). The FAO State of Food Insecurity in the World (FAO, 2002 *In: UNECA, 2003*) indicates that Official Development Assistance (ODA) to agriculture in developing countries declined by an alarming 48% in real terms between 1990 and 1999. These have negatively affected support to agricultural research and extension services in most African countries. Research and extension services are almost non-existent or dead. This has contributed to the decline in yields, as well as continued food insecurity (UNECA, 2003).

“Public spending for agricultural research in Africa stagnated in the 1980s and the 1990s at about US\$ 1,200 million(1.2 billion) per year, slightly higher than the level reached in 1976 (Figure 12.2). This contrasts to the situation of the 1960s and 1970s when public spending on agricultural research more than doubled, from about US \$360 million in 1961 to US \$993 million in 1976” (NEPAD, 2002).

Source: Extracted from NEPAD (2002), with permission NEPAD.

Figure 12.2: Public agricultural research expenditures, 1976-1996

“Public spending on agricultural research in Africa in comparison to agricultural GDP has also declined, from a peak in 1981 of 0.93% to 0.69% in 1991. By contrast, public spending in industrial countries on agricultural research amounted to about 2.4% of agricultural GDP in 1991...Reductions in government support for agricultural research and extension reflect in part pressures on African governments to reduce spending generally (structural adjustment). But spending on agricultural research has also declined in proportion to total government spending, as priorities have shifted and governments question the value of research and extension given the lack of improvement in agricultural productivity in Africa. Similarly, donor support to agricultural research has declined because of shifting priorities, until very recently, away from agricultural production to environmental protection, health, education, water and sanitation, and the like” (NEPAD, 2002).

“Even while funding for agricultural research stagnated in the 1980s and early 1990s, the number of scientists of national agricultural research systems (NARS) and the scope of their activities continued to grow. To meet rising staff costs, many NARS have been forced to cut non-wage operating expenses, starving programs of the many goods and services they need to be effective: laboratory supplies, equipment, spare parts, training, maintenance, fuel, and the like...Linkages between farmers, extension agents, and research systems in Africa are weak. Often researchers have little interaction with extension services and farmers, and do not reflect their priorities in the research agenda” (NEPAD, 2002).

This has been a similar problem in other resource sectors, including forestry, fisheries and wildlife.

Of major concern is the apparent rapid dissolution of agricultural research in South Africa. Traditionally, South Africa and Zimbabwe could feed all of southern Africa in basic food stuff, maize. In South Africa 35,000 farmers,⁴⁹² less than 0.1% of the population, feed 45 million South Africans, while producing a surplus of maize to carry the country over in lean times and to export regionally. Agricultural research and extension are the backbone of maintaining agricultural production and competitiveness in any country. The Agricultural Research Council (ARC) of South Africa, with its 81 branches, has declined from 4,800 employees in 1994, at the time of transition to a post-Apartheid government, to 2,554 at the end of March 2003. The ARC is responsible not only for agricultural research, but for veterinary research in its world famous Onderstepoort facility. The ARC plays a major role, not only in the food security of South Africa, but a major role in southern Africa, providing vaccines, for instance, for lung sickness to Zambia’s farmers (du Toit, 2004). The Government claims that these changes are, as the result of a transformation process, to make the ARC economically viable (Ryan, 2004). Agricultural research and its dissemination to farmers are

⁴⁹² National Department of Agriculture (2003) puts the number of commercial farmers at 50,000.

critical in assuring that South Africa is able to feed itself and the region. With Zimbabwe's virtual elimination of commercial farming, South Africa is the only country left on the continent that is food self-sufficient, to a large part relying on its competitive ability to adapt/adopt the latest technology through agricultural research. South African universities may have to play an increasingly important role in filling the gap in agricultural research.

12.5 DEBT AND STRUCTURAL ADJUSTMENT POLICIES

Debt is a discipline wielded over southern countries (Patel & Delwiche, 2002).

"Debt is an efficient tool. It ensures access to other peoples' raw materials and infrastructure on the cheapest possible terms. Dozens of countries must compete for shrinking export markets and can export only a limited range of products because of Northern protectionism and their lack of cash to invest in diversification. Market saturation ensues, reducing exporters' income to a bare minimum while the North enjoys huge savings. The IMF cannot seem to understand that investing in ... [a] healthy, well-fed, literate population ... is the most intelligent economic choice a country can make" (Shah, 2002).

"Many developing nations are in debt and poverty partly due to the policies of institutions such as the International Monetary Fund (IMF) and the World Bank. Their programs have been heavily criticized for many years for resulting in an increased dependency and poverty by the developing countries upon the richer nations. This is despite the IMF and World Bank's claim that they will reduce poverty. They impose Structural Adjustment Policies (SAPs) to ensure debt repayment in such a way that social spending and development must be cut back and debt repayment must be made the priority. In effect, the IMF and World Bank demand that these poor nations lower the standard of living of their people" (Shah, 2002).

Perkins (2006) documents how the West, especially the U.S., uses multilateral and bilateral loans to developing countries by setting conditions that require

employing the donor country's contractors (see Chapter 11, Section 11.7.2, Foreign Assistance Conditionalities Good Business For Donor County Not Recipient/Host Country). Many of these loans are based on faulty economic forecasts purposely made so that the developing country is strapped with debt, which it cannot pay off, becoming forever beholden to the donor country. The developing country becomes obliged to vote as requested in the UN, provide sites for military bases, and access to cheap oil and natural resources. The general tendency, because of such loans based on faulty economic projections, is that a few elite within a country become rich, while the poor become poorer.

Sub-Saharan Africa's debt crisis worsened during the 1980s, as the ratios of foreign debt to the continent's Gross National Product (GNP) rose from 51% in 1982 to 100% in 1992 and its debt grew to four times its export income in the early 1990s. In 1998, Sub-Saharan Africa's debt stock was estimated at \$236 billion and that of the whole continent was over \$300 billion. Africa's debt burden is twice that of any other region in the world -- it carries 11% of the developing world's debt, with only 5% of its income. GNP in Sub-Saharan Africa is \$308 per capita, while external debt stands at \$365 per capita (Colgan, 2001).

In 2000, 78% of SSA's debt was due to bilateral and multilateral donors. This debt amounted to 113% of exported goods and service (World Bank, 2001 *In: Sogge, 2002*). In 1998, in SSA, US\$ 16 billion was received in foreign aid, but only US\$ 3 billion went directly into general government budgets, while US\$ 9 billion was required to service debts (Sogge, 2002) (see Chapter 11, Section 11.7.1, Foreign Aid as Portion of Donor Country GNP).

“Each year developing countries pay the West nine times more in debt repayments than they receive in grants:

- The UK Charity Comic Relief⁴⁹³ raised £26 million (≈\$US 42 million) in 1997. Africa paid this back in debt service in just over a day.
- Each person in the Third World owes about £250 (≈\$US 408) to the West - much more than a year's wage for many.
- Of the 32 countries classified as severely indebted low-income countries, 25 are in Sub-Saharan Africa.
- Africa spends 4 times as much on debt repayment as she does on healthcare.
- In 1960, the income of the wealthiest 20% of the world’s population was 30 times greater than that of the poorest 20%. Today it is over 60 times greater.
- For a billion people, development is being thrown into reverse. After decades of steady economic advance, large areas of the world are sliding back into poverty.

Millions of people around the world are living in poverty because of Third World debt and its consequences...Sub-Saharan Africa owes £140 billion (≈\$US 228 billion) (83% of its total GNP). These enormous debts mean that repayments to Western Creditors take priority and ordinary people suffer: in poor health, in restricted access to education, in lack of employment and in limited ability to trade and provide for themselves” (ANON, 1998).

The Commission for Africa (2005) estimates that “for every \$US 2 Africa currently receives in aid, it pays back nearly \$US 1 in debt payments. Sub-Saharan Africa’s total external public debt totaled \$US 185 billion in 2003”.

⁴⁹³ Comic Relief was set up by comedians and uses comedy and laughter to get serious messages across and is committed to helping end poverty and social injustice, <http://www.comicrelief.com/>.

12.5.1 The HIPC Initiative - Half-hearted, Inadequate, Piecemeal Cancellation “Debt Relief”

In 1996, under intense pressure from popular movements in the North and South, western government creditors buckled.

“They launched a ‘half-hearted debt cancellation initiative’ – the Heavily Indebted Poor Countries (HIPCs) Initiative – under the World Bank’s aegis... Three and a half years later, at the beginning of June 1999, only 2.6% of the debts of 41 countries had been written off; and only 4 countries had received some debt relief (Uganda, Bolivia, Mozambique and Guyana). The rise in interest payments made by HIPCs wiped out any benefit gained by the four. The total debt of 41 HIPCs remained unchanged; \$216 billion in 1996; and \$216 billion in 1998. Even more disturbing, under the debt relief scheme, debt service paid by the poorest most indebted nations of the world, rose from \$25 billion a year to \$28 billion in 1998” (Hanlon & Pettifor, 2002).

Sachs (2005) believes that the “HIPC initiative itself was a recognition that the structural adjustment era had failed”.

The continent of Africa contains the most severely indebted countries in the world. Twenty-six countries (Palmer & Kline, 2003), 38 according to Lerrick (2005), are now receiving debt relief under the Heavily Indebted Poor Countries (HIPCs) Initiative (Palmer & Kline, 2003). Of these, 19 still spend more than 10% of government revenues on debt repayments. For some of the world’s poorest countries, this amounts to a massive transfer of scarce resources. Zambia, for example, is spending more on debt repayments – US\$ 183 million a year – than it spends on health or primary education (Palmer & Kline, 2003). Lerrick (2005) places HIPC debt globally at US\$ 144 billion, of which 94% are official loans from Western donors; US\$ 57 billion (39.6%) in bilateral debt and \$US 79 billion (54.9%) in multilateral debt. Of this HIPC debt, about US\$ 118 billion is

in Sub-Saharan Africa that contains 32 of the current 38 HIPC countries (Lerrick, 2005). Bilateral aid comes from national donors (see Chapter 11, Section 11.7.1, Foreign Aid as Portion of Donor Country GNP). Multilateral donors in Sub-Saharan Africa include:

- The International Monetary Fund (IMF)'s "bank" is the General Resources Account (GRA) that borrows from its members and re-lends the proceeds;
- The IMF: Special Disbursement Account /Poverty Reduction and Growth Facility (SDA/PRGF) Trust Funds: The IMF's "fund" is composed of a series of trusts and special lending facilities;
- The International Bank for Reconstruction and Development (IBRD) at the World Bank.
- The International Development Association (IDA) fund at the World Bank gathers contributions from rich countries and redistributes resources to poor members through 30-40 year loans at virtually non-existent 0.5-2% interest; and
- The African Development Bank/*Banque Africaine de Developpement* (ADB/BAD) and Fund.

The Secretary General of the UN, the United Nations Children's Fund (UNICEF), the Organization for African Unity, religious leaders and non-government organizations all expressed concern that too little debt relief was being delivered too late. A related concern was that the HIPC framework had not been integrated into a wider strategy for poverty reduction (OXFAM, 1998). The U.S. Congressional sponsored Meltzer Commission (2000) recommended that HIPC debt should be forgiven in its entirety, conditional on the debtor countries implementing institutional reforms and an effective development strategy.

"Finally on 8 February 2000, three countries were announced as having reached 'decision point' and therefore qualifying for HIPC II debt relief. They were Bolivia, Uganda and Mauritania. Whilst this modest announcement was welcomed, campaigners were amazed that Mozambique and Guyana, who had already qualified and received relief under HIPC I, did not automatically qualify for the second *tranche* (portion) of relief, but were being delayed for technical reasons. This became even more shocking when it became apparent that floods in Mozambique had devastated crops in many parts of the country and left thousands homeless. Equally shocking was the case of Madagascar, also hit by hurricanes and floods. Madagascar is on the HIPC list and, despite the floods, is not due to receive debt cancellation until 2001 at the earliest, and will have to pay \$233 million in debt service while it tries to rebuild its country.

The current system for qualifying for debt relief (under HIPC II) requires that countries have carried out an IMF austerity economic program for at least 3 years. These conditions are exhaustive and often contradictory. For example, Tanzania's current list of conditions demand that it 'limits public spending' whilst also 'building and maintaining quality public services'.

In response to criticisms from campaign groups and UN agencies that IMF conditions concentrate too much on austerity measures, and not enough on poverty reduction, the World Bank and IMF introduced in September 1999 a new set of economic hurdles for indebted nations to jump" (Hanlon & Pettifor, 2002).

The IMF renamed its structural adjustment facility the Poverty Reduction and Growth Facility (PRGF). In 2000, borrowing countries began preparing Poverty Reduction Strategy Papers (PRSPs) as a prerequisite for a World Bank/IMF adjustment loan. These PRSPs are supposed to outline—after a broad consultative process—a country's poverty-reduction priorities and economic policies to achieve them. These PRSPs serve as a framework for lending by International Finance Institutions (IFIs) such as the World Bank and IMF and from bilateral donors. The September 2005 "African Action Plan" (World Bank, 2005) appears to follow the PRSP process. Its goals (health, clean water, education, nutrition, agricultural development, development of an African private sector, export led

growth, improving infrastructure and debt relief), while laudable, are “old wine in a new bottle”. What must be asked is will this result in more government-to-government foreign assistance (see Chapter 11, Section 11.7.1.1, Overseas Development Assistance [ODA] versus Overseas Assistance [OA]) leading to further spiraling debt or will development be driven by the private sector based on beneficiation of Sub-Saharan Africa’s natural resources?

The UN (2002) says this about IMF and World Bank policies,

“The international community has begun to address these concerns. ‘Ownership’ and ‘participation’ are now buzzwords. The World Bank has introduced a Comprehensive Development Framework to help donors coordinate their support for a country’s chosen strategy. IMF has renamed its Enhanced Structural Adjustment Facility the Poverty Reduction and Growth Facility and has revamped it around the new vehicle of Poverty Reduction Strategy Papers (PRSPs) (which the World Bank also plans to support via Poverty Reduction Credits), which present a country’s own deliberated strategy for tackling poverty. These initiatives go very much in the right direction. The question is whether they go far enough...a new relationship between the donor community and Sub-Saharan Africa is needed if the prospects of that troubled region are to improve...Each potential aid recipient would elaborate its own development strategy, programs and projects, primarily in consultation with its own population but also in a dialogue with donors”.

Many NGOs and civic groups in PRSP countries argue that the fundamentals of SAPs remain unchanged (Welch 2001; Sogge, 2002).

“The PRSP is supposed to be put out to wide civil society consultation. But the IMF told Mozambique and Mauritania that they could obtain rapid approval for debt relief under HIPC only if they did not put the PRSP out for public consultation” (Hanlon & Pettifor, 2002).

Colgan (2001) also questions the adequacy of civil society involvement in this process. Stiglitz (2002) believes that the World Bank is much more open to “participatory poverty assessments” than the IMF. He goes on to say that these joint IMF, World Bank, greater civil society assessments are a step in the right direction, even if there is a gap between rhetoric and reality, but if the gap persists for too long, it could, and is, resulting in disillusionment.

NGOs argue that PRSPs incorporate structural adjustment policies that have consistently failed, reflecting the pressures on governments to conform to the policy expectations of the Bank and IMF; governments writing into the PRSPs what they already know the donors want to hear (Wood, 2000; UNCTAD, 2002). The PRSP process has, so far, failed to change structural adjustment programs or to force the International Finance Institutions (IFIs) to prove how their policies will help poor people and promote sustainable development (Welch, 2001). The PRSP process is also criticized as being too complex.

“The World Bank’s online handbook advising countries on how to prepare such documents (PRSPs) runs well over 1,000 pages and covers such varied topics as macroeconomics, gender, the environment, water management, mining, and information technology. It would be hard for even the most skilled policymakers in the advanced economies to follow such complex (no matter how salutary) advice” (Easterly, 2001).

Surveys by the United Nations Economic Commission for Africa (ECA)

“agreed that PRSPs are broadly pro-poor. But it was not quite as sanguine about the effectiveness of implementation and the likelihood that the poor will actually benefit from pro-poor programs. In Ghana, one of the countries that reduced poverty in the 1990s, a recent survey by the Ghana Statistical Service reported that only a quarter of respondents said they were better off while half said they were worse off” (World Economic Forum, 2004).

The ILO (2004) states,

“Conditions attached to debt relief and cancellation are legitimate if they ensure that the savings are channeled into growth-enhancing, employment-creating and poverty-reducing programs which respond to the needs of people. But they must not reproduce past structural adjustment policies that have not worked, such as dogmatic demands for privatization and reduced public services. The heads of the Bretton Woods Institutions have indicated that this is no longer the case, and recent evidence now shows increases in public spending on education and health associated with the HIPC”.

12.5.2 2005 Debt Cancellation

In mid-June 2005, the G-8 finance ministers agreed to write-off US\$ 40 billion in debt to 18 HIPC countries, 14 in Sub-Saharan Africa. Eventually, 38 nations with 552 million people may get full debt relief (McLaughlin, 2005) with a package amounting to US\$ 55 billion (CNN, 2005).⁴⁹⁴ This will save the 18 countries a total of US\$ 1.03 (DATA, 2005a; 2005b) to 1.5 billion/year (McLaughlin, 2005), that is to be used for health, education and agricultural development. Concern exists that, as has happened in the past, debts will be forgiven and a new set of foreign aid loans will create a new cycle of dependency (Lerrick, 2005; McLaughlin, 2005).

How significant is this debt relief? As per the US\$ 1 billion/year that the US\$ 40 billion debt-relief initiative is projected to save poor African nations, the International Energy Agency expects the rise in oil prices to cost poor African

⁴⁹⁴ Countries currently qualifying for debt relief include in Africa: Benin, Burkina Faso, Ethiopia, Ghana, Madagascar, Mali, Mauritania, Mozambique, Niger, Rwanda, Senegal, Tanzania, Uganda and Zambia. In Latin America: Bolivia, Guyana, Honduras & Nicaragua. Countries that could soon qualify: Cameroon, Chad, Congo, Gambia, Guinea, Guinea-Bissau, Malawi, Sao Tome & Principe, & Sierra Leone (McLaughlin, 2005).

countries US\$ 10 billion (Washington Times, 2005), wiping out potential benefits from debt relief as the key to resolving Sub-Saharan Africa's economic ills.

12.5.3 Why Debt Relief Can't Work

"Debt relief is not new. As long ago as 1967, the UN Conference on Trade and Development argued that debt service payments in many poor nations had reached 'critical situations.' A decade later, official bilateral creditors wrote off \$6 billion in debt to 45 poor countries. In 1984, a World Bank report on Africa suggested that financial support packages for countries in the region should include 'multiyear debt relief and longer grace periods.' Since 1987, successive G-7 summits have offered increasingly lenient terms, such as postponement of repayment deadlines, on debts owed by poor countries. (Ironically, each new batch of terms and conditions was named after the opulent site of the G-7 meeting, such as the 'Venice terms,' the 'Toronto terms,' and the 'London terms.') In the late 1980s and 1990s, the World Bank and International Monetary Fund (IMF) began offering special loan programs to African nations, essentially allowing governments to pay back high-interest loans with low-interest loans—just as real a form of debt relief as partial forgiveness of the loans. The World Bank and IMF's more recent and well-publicized Highly Indebted Poor Countries (HIPC) debt relief program therefore represents but a deepening of earlier efforts to reduce the debt burdens of the world's poorest nations" (Easterly, 2001).

"During the last two decades, the multilateral financial institutions granted 'structural adjustment' loans to developing nations, with the understanding that governments in poor countries would cut their fiscal deficits and enact reforms—including privatization of state-owned enterprises and trade liberalization—that would promote economic growth. The World Bank and IMF made 1,055 separate adjustment loans to 119 poor countries from 1980 to 1999. Had such lending succeeded, poor countries would have experienced more rapid growth, which in turn would have permitted them to service their foreign debts more easily. Thirty-six poor countries received 10 or more adjustment loans in the 1980s and 1990s, and their average percentage growth of per capita income during those two decades was a grand total of zero.

The lesson of structural adjustment programs is that reforms imposed from the outside don't change behavior. Rushing through debt forgiveness and imposing complex reforms from the outside is as doomed to failure as earlier rounds of debt relief and adjustment loans" (Easterly, 2001).

12.5.3.1 Debt relief creates more debt

"In reality the foreign debt of poor countries has always been partly fictional. Whenever debt service became too onerous, the poor nations simply received new loans to repay old ones. Indeed, over the past two decades, new lending to African countries more than covered debt service payments on old loans" (Easterly, 2001).

However, the new loans must be repaid with interest, so the debt only worsens. From 1989 to 2002, 38 of the world's poorest countries, mostly in Africa, received US\$ 40 billion in debt relief and still piled up US\$ 93 million in new loans. By the end of 2004, they owed US\$ 144 billion to multilateral institutions such as the World Bank and IMF, other countries and private banks. Debt cancellation and foreign aid are small pieces to a broader strategy that will reduce poverty, addressing trade issues being the key (Sparshott, 2005). Similarly, Lerrick (2005) concludes,

"the HIPC debt burden is phantom and imposes no demands on impoverished economies. For the last 20 years, each and every HIPC nation, regardless of corruption, waste and failure to comply with conditions, has benefited from an annual net inflow of official funds...a system of 'defensive lending' has miraculously matched the dates and amounts of repayment and interest schedules to disbursements under 'new' loans to create a perpetual rollover of defaulted debt obligations. Adding interest compounds the loans as well as the problem...Only a name separates rotating defaulted loans in perpetuity from the finality of debt cancellation. No real resources have been transferred out of the poorest debtor economies to the multilaterals because the debt has not been effectively repaid. Year by year, every poor

country outflow has been offset by a predictable and assured balancing inflow”.

Meanwhile, poverty continues to increase in most Sub-Saharan African countries as indicated by declining per capita GNIs (GNPs) (Lerrick, 2005).

The Democratic Republic of Congo and Debt Relief

For instance, the Democratic Republic of Congo is requesting a US\$ 10 billion of US\$ 13 billion debt write-off by lenders (Walker, 2002). At the same time, The International Monetary Fund (IMF) has agreed to a \$750 million loan to the Democratic Republic of Congo, intended to help reduce poverty and promote economic growth (IMF, 2002; Walker, 2002). Thus, “...Debt relief encourages borrowers to take on an excessive amount of new loans expecting that they too will be forgiven” (Easterly, 2001). One has to wonder, with possibly the richest mineral and oil wealth in the world, why does the Democratic Republic of Congo need bank loans? (see Chapter 13, Section 13.10.3, Congo-Kinshasa DRC, Africa’s world resource war).

12.5.3.2 Debt relief/cancellation does not reduce poverty

“Debt relief advocates should remember that poor people don't owe foreign debt—their governments do. Poor nations suffer poverty not because of high debt burdens but because spendthrift governments constantly seek to redistribute the existing economic pie to privileged political elites rather than try to make the pie grow larger through sound economic policies... bad governments are likely to engage in new borrowing to replace the forgiven loans, so the debt burden wouldn't fall in the end anyway. And even if irresponsible governments do not run up new debts, they could always finance their redistributive ways by running down government assets (like oil and minerals), leaving future generations condemned to the same overall debt burden. Ultimately, debt relief will only help reduce debt burdens if

government policies make a true shift away from redistributive politics and toward a focus on economic development” (Easterly, 2001) (see Chapter 13, Section 13.9, GLOBALIZATION, AFRICA AND RESOURCE WARS – CAPITALISM WITHOUT A CONSCIENCE – BOOTY FUTURES).

Lerrick (2005), along with the Meltzer Commission (2000) and the present Bush Administration, support full debt cancellation since developing countries will never be able to repay this debt. In turn, they believe foreign aid should consist of performance-based grants, as opposed to loans that will encourage Foreign Direct Investment (FDI) and economies driven by the private sector that help create a middleclass on the subcontinent. Performance-based policies include transparency, good governance and devolution of land and resource tenure to the rightful owners, among others. The U.S. Millennium Challenge Account is based on this principle (see Chapter 13, Section, 13.16, NEW MILLENNIUM CHALLENGE ACCOUNT).

12.5.3.3 Debt relief/cancellation and military spending

“Debt relief enables governments to spend more on weapons, for example. Debt relief clients such as Angola, Ethiopia, and Rwanda all have heavy military spending” (Easterly, 2001).

It is the authors’ experience in Sub-Saharan Africa that writing off or relieving debt is of little value by itself, even if this debt was incurred during the dictatorial, and often repressive, regimes supported by the West during the Cold War to the detriment of civil societies in these countries; “Odious Debt”. Debt relief can only be a temporary fix, a form of welfare, unless Sub-Saharan Africa starts standing on its own two feet and stops relying on continually being propped up by more foreign aid loans with interest rates that it can never hope to repay.

In other words, writing off the bad debt of the Cold War, in which loans were squandered and stashed away in personal Swiss Bank Accounts of the ruling elite, while the West buried its head in the sand, and/or more new debt relief will not solve the subcontinent's long-term economic ills nor reduce poverty.

Stephen Hayes of the Corporate Council on Africa in Washington, referring to the aid and lending paradigms that have dominated development work for decades, “‘I don't think Africa develops without a middleclass,’ he says, ‘and that will emerge only through trade and entrepreneurship’ ” (McLaughlin, 2005). The U.S. and Britain are miles apart on foreign aid, with the U.K. adopting the formula of 0.7% of the GNP, while Washington has declined a numerical commitment preferring trade over aid, such as the African Growth and Opportunity Act (AGOA) (see Chapter 13, Section 13.13.6.2, AGOA) (Latham, 2005; Wolfson, 2005). Regardless, the real issues in the long-term are agricultural subsidies (Latham, 2005) and other protectionist measures, as discussed above (tariffs, quotas, etc.), that adversely impact Sub-Saharan Africa’s economies and the need for Foreign Direct Investment (FDI) in Sub-Saharan Africa.

12.6 IMPACTS OF STRUCTURAL ADJUSTMENT ON SOCIAL WELFARE AND EMPLOYMENT

“The decades in which Asia was investing, the 1970s and 1980s, were the years of crisis when African governments were slashing the budgets of both clinics and schools at the behest of the International Monetary Fund (IMF). Evidence shows that IMF and World Bank economic policy in the 1980s and early 1990s took little account of how these policies would potentially impact on poor people in Africa. Many health and education systems began to break down. And all of this came just as AIDS began to take its deadly toll” (Commission for Africa, 2005).

12.6.1 Health and Structural Adjustment

Health is a fundamental human right, recognized in the Universal Declaration of Human Rights of 1948, and the Constitution of the World Health Organization of 1946. Health is also an essential component of development, vital to a nation's growth and internal stability. Investments in health care by African governments in the 1970s achieved improvements in key health indicators.

The health care systems inherited by most African states after the colonial era were unevenly weighted toward privileged elites and urban centers. In the 1960s and 1970s, substantial progress was made in extending primary health care and to emphasize the development of a public health system to redress the inequalities of the colonial era. The World Health Organization (WHO) emphasized the importance of primary healthcare at the historic Alma Ata Conference in 1978. The Declaration of Alma Ata focused on a community-based approach to health care and resolved that comprehensive health care was a basic right and a responsibility of government (Colgan, 2002).

“These efforts undertaken by African governments after independence were quite successful. There were increases in the numbers of health professionals employed in the public sector, and improvements in health care infrastructure in many countries. There was also some success in extending care to formerly unserved areas and populations. Across the continent, there were improvements in key health care indicators, such as infant mortality rates and life expectancy” (Colgan, 2002):

- “In Zambia, the post-independence government expanded public health care services throughout the country. The number of doctors and nurses was also significantly increased during this time. Infant mortality was reduced from 123 per 1,000 live births in 1965, to 85 in 1984” (Colgan, 2002)
- “In Tanzania, during the first two decades of independence, the government succeeded in expanding access to health care nationwide. By 1977, more than 75% (three-quarters) of

Tanzania's population lived within 5 km of a health care facility" (Colgan, 2002).

- "In Kenya child mortality was reduced by almost 50% in the first two decades after independence in 1963" (Colgan, 2002).
- "Across Sub-Saharan Africa, the first decades after independence saw significant increases in life expectancy, from an average of 44 years to more than 50 years" (Colgan, 2002).

While the progress across the African continent was uneven, it illustrated a commitment by African leaders to the principle of building and developing their health care systems. With the economic crisis of the 1980s and 1990s, as African governments became clients of the World Bank and IMF, they forfeited control over their domestic spending priorities. The loan conditions of these institutions forced contraction in government spending on health and other social services (Colgan, 2002).

World Bank and IMF policies exacerbated poverty, providing fertile ground for the spread of HIV/AIDS and other infectious diseases. Cutbacks in health budgets and privatization of health services eroded previous advances in health care and weakened the capacity of African governments to cope with the growing health crisis. In the 42 poorest countries in Africa, spending on health care fell by 50% during the 1980s.

"The dramatic drop in health expenditure in the 1980s and 1990s resulted in the closure of hundreds of clinics, hospitals and medical facilities across the continent...Thousands of health care professionals throughout the continent lost their jobs as a result of public sector cuts. In Ghana, between 1982 and 1992, the number of doctors in the government health care system dropped from 1,700 to 665. In Senegal, between 1980 and 1993, the number of people per nurse increased six-fold" (Colgan, 2002).

Consequently, during the past two decades the life expectancy of Africans has dropped by 15 years (Colgan, 2002).

By the 1990s, most African countries were spending more repaying foreign debts, than on health or education for their people. By 1997, Sub-Saharan African governments were transferring to Northern creditors four times what they were spending on the health of their people (Colgan, 2002):

- In the 21st century, Zambia is paying three times as much in debt service as on health care (UNDP, 2002 *In:* Patel & Delwiche, 2002), as the result of the structural adjustment program; and
- In 1998, Senegal spent five times as much repaying foreign debts as on health (Colgan, 2002).

By 1992, the U.S. Center for Disease Control in Atlanta was condemning the World Bank and IMF imposed “user fees” as part of SAP policies, resulting in a plummeting utilization of health care facilities in Sub-Saharan Africa with the consequence of exacerbating the spread of HIV/AIDS (Bond & Manyanya, 2003).

12.6.1.1 Increase in poverty and decline in health from structural adjustment

“The relationship between poverty and ill-health is well established. The economic austerity policies attached to World Bank and IMF loans led to intensified poverty in many African countries in the 1980s and 1990s. This increased the vulnerability of African populations to the spread of diseases and to other health problems” (Colgan, 2002) (see Chapter 5, Section 5.4, HUNGER LINKED TO POVERTY).

“The public sector job losses and wage cuts associated with World Bank and IMF programs increased hardship in many African

countries. During the 1980s, when most African countries came under World Bank and IMF tutelage, per capita income declined by 25% in most of Sub-Saharan Africa. The removal of food and agricultural subsidies caused prices to rise and created increased food insecurity. This led to a marked deterioration in nutritional status, especially among women and children.

In Zambia, following the elimination of food subsidies, many poor families had to reduce the number of meals per day from two to one. Malnutrition resulted in low birth weights among infants and stunted growth among children in many countries. It is currently estimated that one in every three children in Africa is underweight. In general, between 25% (one-quarter) and 33% (one-third) of the population of Sub-Saharan Africa is chronically malnourished” (Colgan, 2002).

Low birth weights and malnourished children during the first four to five years of life will impact on their learning ability (see Chapter 5, Section 5.3.1.1, Worldwide over-production of food, a big question in the 21st century and Section 5.3.3, Food Security in Africa and Section 5.4, HUNGER LINKED TO POVERTY).

Some improvements in health, gained over the 1960s and 70s, have been turned back or stopped in many countries since the 1980s, when the debt crisis broke. The number of children who die before the age of five, or before the age of one, has risen in many deeply indebted countries, including Zimbabwe, Zambia, Nicaragua, Chile and Jamaica, after decades of falling numbers. In Zimbabwe, spending per head on healthcare has fallen by 33% (one third) since 1990, when a Structural Adjustment Program was introduced. In Uganda, £2 per person is spent on healthcare, compared with £11.50 per person on debt repayments (ANON, 1998).

“Diseases thought to be eradicated - tuberculosis, yaws, yellow fever - are making a comeback in some countries as treatment and vaccination coverage declines” (ANON, 1998).

“The deepening poverty across the continent has created fertile ground for the spread of infectious diseases. Declining living conditions and reduced access to basic services have led to decreased health status. In Africa today, almost half of the population lacks access to safe water (see Chapter 11, Section 11.13.2.4, Safe drinking water in Africa as a health indicator) and adequate sanitation services. As immune systems have become weakened, the susceptibility of Africa's people to infectious diseases has greatly increased” (Colgan, 2002).

“A joint release issued by the WHO and the Joint UN Program on HIV/AIDS (UNAIDS - Joint United Nations Program on HIV/AIDS) in April 2001 reports that the number of cases of tuberculosis in Africa will reach 3.3 million/year by 2005. The WHO reported in 2001 that almost 3,000 Africans die each day of malaria. Each year in Africa, the disease takes the lives of more than 500,000 children below the age of five” (Colgan, 2002).

Most devastating of all has been the impact of the HIV/AIDS pandemic. The spread of HIV/AIDS in Africa has been facilitated by worsening poverty and by the conditions of inequality intensified by World Bank and IMF policies. Economic insecurity has reinforced migrant labor patterns, which in turn have increased the risk of infection. Reduced access to health care services and health education has increased the spread of sexually transmitted diseases and the vulnerability to HIV infection. More than 17 million Africans have died of HIV/AIDS. It is currently estimated that more than 28 million of the 40 million people living with the disease worldwide are in Sub-Saharan Africa. There are more than 12 million African orphans who have lost their mothers or both parents to AIDS. The social and economic effects of the AIDS crisis are reversing post-independence progress and exacerbating conditions of under-development. The policies imposed by the World Bank and IMF have fueled the spread of the disease and continue to hinder the response to this health emergency (Colgan, 2002) (see Chapter 5, Section 5.8, HIV/AIDS DECLINING AGRICULTURAL PRODUCTION AND FOOD SECURITY IN SSA).

12.6.2 Education and Structural Adjustment

The major decline in GDP, as a result of structural adjustment, meant that while Sub-Saharan Africa's investment in education, compared to the percentage of its GDP, is middle of the road (ILO, 2004) compared to the rest of the world, as Africa's per capita GDP fell from US\$ 671 in 1975 to US\$ 245 by 1997 (Zack-Williams, 2002 *In: Zack-Williams, et al., 2002*), the money available for education significantly declined. Additionally, structural adjustment policies took away free education, requiring the payment of fees, which the majority in Sub-Saharan Africa could not afford to pay. In October 2000, the World Bank was instructed by the U.S. Congress never to impose policies requiring user fees on education and health care, with water being added in 2002 (Bond, 2002). In 2002, the U.S. Congress and the president signed a law requiring the United States to oppose proposals for International Finance Institutions (IFIs) to charge fees for primary schools under the name of "cost recovery". However, this appears to have been largely ignored and given the secrecy in which the IMF operates, it is hard to ascertain if this has had any impact on the ground (Stiglitz, 2002).

Yet, education is a key element in a global economy where education, skills and knowledge are increasingly important for economic survival, let alone success (ILO, 2004).

"At Tanzania's independence in 1961, 85% of adults were illiterate, and less than half the country's children were in school. Although some countries were better off—Nigeria and Ghana, in particular, had long histories of educational development at home and study abroad—others were even further behind. At Mozambique's independence in 1975, 93% were illiterate, and less than 33% (a third) of primary-age children were in school. Africa's first post-independence generation—broadly speaking, from the 1960s to the end of political Apartheid in South Africa in 1994 - made significant advances. Most notably, the newly independent

states educated far more of their children than preceding colonial regimes, and many made impressive strides in delivery of basic health care and potable water, expansion of infrastructure, and industrial production for the domestic market" (Minter, 2001).

Structural Adjustment ended this progress.

"As schools are forced to charge fees, fewer people are able to send their children and education is mainly available only to the better-off. In Sub-Saharan Africa the damage to education has been particularly significant: the percentage of 6-11 year olds enrolled in school has fallen from nearly 60% in 1980 to less than 50% in 1990. In Tanzania, school fees have been introduced as part of a Structural Adjustment Program, leading to a drop in primary and secondary school enrolment" (ANON, 1998) (see Chapter 11, Section, 11.13.1.1 Educational situation in Sub-Saharan Africa at the beginning of the new millennium).

Currently, the Tanzanian government spends twice as much per capita on debt repayments as on education and four times as much on debt repayment as on primary education. More than two million Tanzanian children are not in school and illiteracy is rising at 2%/year. In some schools there is one desk for every 38 pupils, one textbook for every four children and one toilet for every 89 pupils. Classrooms crumble unless parents can fund their rebuilding. Teachers have been left demoralized by falling salaries, worsening conditions and increasing class sizes (OXFAM, 2000).

On the other hand, President Museveni of Uganda has ignored IMF advice and has created universal primary education for all, resulting in a massive increase in enrollment of both boys and girls (Stiglitz, 2002), which will help in the transformation of Uganda in what Museveni calls a pre-industrialized society to an industrialized society, straight into the information age. The rigid IMF policies often fail to take into account these important social and development issues needed to transform the continent in favor of strict economic, often short-term,

fixes at all costs, which most of the time have not straightened out the economies, but only made them worse. The principal author was in Uganda in 2002. In some areas, there were schools literally every 5-10 kilometers, indicating not only the success of President Museveni's education platform, but raising an ominous problem facing much of the continent, a very large portion of society under 15 years of age exploding into the workforce, and hoping for a better way of life than their parents.

Much of the impacts of Structural Adjustment and the Washington Consensus on education in Sub-Saharan Africa are summed up in a conversation between the Past President of Tanzania, Julius Nyerere, and a World Bank "expert", when President Nyerere was asked by the expert why he had failed (*In: Legum, 2002*):

" 'The British Empire left us a country with 85% illiterates, 2 engineers and 12 doctors. When I left office in 1985, we had 9% illiterates and thousands of engineers and doctors. At that point our income per capita was 2x what it is today – after the Structural Adjustment program - We now have 33% (one third) less children in our schools, and public health and social services are in ruins. During those years, Tanzania has done everything that the World Bank and the IMF have demanded. So I ask you: Why have you failed?" "

12.6.3 Employment and Structural Adjustment

"The IMF encourages hard-pressed governments to cut back spending and downsize government departments (necessary!). This often means a rise in unemployment and a cut in wages. Real wages in most African countries have fallen by 50-60% since the early 1980s. In Mexico, Costa Rica and Bolivia average wages have fallen by 33% (a third) since 1980. Unemployment has risen in many countries in Africa and Latin America since the 1980s - in Zambia, Tanzania and Ghana, over 20% of the working population are unemployed. High levels of unemployment are counterproductive as there are fewer taxpayers to contribute to the

public purse. So governments raise less through taxation" (ANON, 1998).

12.7 NET RESULT OF STRUCTURAL ADJUSTMENT ON AFRICA – NEGATIVE

"The past two decades of World Bank and IMF structural adjustment in Africa have led to greater social and economic deprivation, and an increased dependence of African countries on external loans. The failure of structural adjustment has been so dramatic that some critics of the World Bank and IMF argue that the policies imposed on African countries were never intended to promote development. On the contrary, they claim that their intention was to keep these countries economically weak and dependent" (Colgan, 2002).

The net result of structural adjustment has been a sharp decline in real income, especially for urban populations dependent on imports for such basic necessities as food and fuel. For example, between 1980 and 1984, the purchasing power of urban worker's wages declined by 50% in Tanzania and by 40% in Ghana (World Bank, 1986 *In: Martin & O'Meara, 1995*). Yet one of the largest economies in the World, the USA, seems to function almost as well under a balanced budget (William (Bill) Jefferson Clinton Era) as under deficit spending (Reagan and Bush Administrations). It would seem that the Third World is being forced to take a medicine often ignored by the First World. Ultimately, SAPs contributed to the proletarianisation of the middleclasses, bringing an army of bureaucrats, intellectuals and professionals into the ranks of workers, peasants and the unemployed.

"Virtually the entire group of development NGOs, like OXFAM, WDM (World Development Movement) and Christian Aid, are highly critical of the policies imposed by the IMF under ESAF (Enhanced Structural Adjustment Facility). They do not reduce poverty and mainly benefit the better off in poor countries; they seem designed more to benefit large corporations by giving them

cheaper raw materials and access to new markets. The Wall Street Journal has waded in to give support to these views. In a searing attack on the retiring managing director of the IMF, Michel Camdessus, the journal accused the IMF, under Camdessus of a bias toward devaluation, which is supposed to 'revive' exports even as the inevitable, resulting inflation quickly diminishes the resident population's incomes and assets. Impoverishing people in this way is morally indefensible and politically unsustainable" (Hanlon & Pettifor, 2002).

In fact, Sub-Saharan African (SSA) people living below a poverty line, as defined at US\$ 1/day, increased from 217 million to 291 million from 1987 to 1998, averaging around 46% of the total population over the period. A more recent study by the UNCTAD secretariat, using the World Bank's definition, but a different methodology (bringing together household survey and national accounts data), estimates that the proportion of the population living on less than US\$ 1 a day in the Least Developed Countries (LDCs) of Africa has increased continuously since 1965–1969; rising from an average of 55.8% in those years to 64.9% in 1995–1999. Over the past two decades, where growth in income in SSA has barely kept pace with population, (structural) adjustment policies, including trade and financial liberalization, privatization and retrenchment of the public sector, have played a significant role in the hollowing out of the middleclass. Poverty alleviation can succeed only if it leads to rapid and sustained growth and job creation (UNCTAD, 2002; Gavlak, 2002). Some people call structural adjustment policies a form of "Economic Apartheid" between the First World and the Developing World (Global Issues, 2002b) (see Section 12.1.1, Historical Perspective).

12.7.1 Structural Adjustment and Zimbabwe

The IMF and World Bank are instruments of Western governments and multi-nationals to extract raw products from Africa and other Third World countries. The net result of the Economic Structural Adjustment Program (ESAP) on Zimbabwe was: 1) Devaluation of the local currency, 2) Inflation, 3) Inability of local people's buying power for locally manufactured products, let alone imported products and 4) Inability to access FOREX to buy spare parts and new machinery to maintain competitiveness in the international market place (Milambo, *et al.*, 2000).

Local industries folded and it was cheaper for the West to come in and take out raw products (e.g., Africa's minerals), in order to obtain the added value of transformation in Europe and America, maybe even selling the transformed product back to Africa. Countries like Zimbabwe remain welfare states forever, dependent on Western donors who take much more than they give (Milambo, *et al.*, 2000).

In 1998, Zimbabwe spent 38% of its export earnings to service foreign debt. The “Economic Structural Adjustment Program” (ESAP), designed in 1990 by the World Bank and IMF to deregulate and indebt an economy seen as over-protected and inefficient, was adhered to by the Zimbabwe ruling party, Zimbabwe African National Union – Patriotic Front (ZANU-PF). Its failure was fundamental to the model imposed on Zimbabwe (Bond & Manyanya, 2003).

12.7.1.1 Import substitution

A tentative economic strategy based on substituting imported goods with local products began (import substitution). By 1926, manufacturing contributed 13% of the colony's Gross National Product (GNP), small companies producing products for the local black consumer market. Still, the economy remained extractive based on agriculture and mining exports, which rose to £ 6.6 million by 1929 (Bond & Manyanya, 2003). The worldwide depression of the 1930s saw a 50% decrease in the foreign market for Zimbabwe's goods. This forced Zimbabwe to deglobalize and develop its own internal economy and local industry began to flourish in iron, steel and cotton spinning, along with state credit to help farmers develop their land. White miners were encouraged to operate small independent gold operations, as foreign companies' mineral rights were taken over. The railroad was nationalized (Bond & Manyanya, 2003). In 1933, an all-white election chose self-governance over uniting with South Africa. Output more than tripled over the next decade, the economy growing from £9 to £ 28 million in constant 1929 currency (Barber, 1961 *In:* Bond & Manyanya, 2003).

Successful "import substitution" industrialization polices, mostly run by white entrepreneurs, as opposed to failed state parastatals common across most of the continent in post-independent Sub-Saharan Africa, made the colony increasingly self-reliant. Food processing of agricultural produce provided added value and accounted for 1/3rd (33%) of the manufacturing. Small manufacturers of clothing and textiles grew, aimed at the black consumers whose wages by 1950 composed 25% (1/4) of the national income. Manufacturing grew by an average of 24.4% annually from 1944-1948 (Sowelem, 1967; Stoneman, 1981; Phimister, 1988 *In:* Bond & Manyanya, 2003). However, as in the agricultural economy of the southern United States prior to its Civil War, the high profits of these white-

owned industries were built on the “slave” wages of the black workers whose living conditions remained appalling, with construction of formal Apartheid-style townships (Bond & Manyanya, 2003).

12.7.1.2 Beginning of World Bank interventions

After WWII, investments by multi-national corporations nearly quadrupled the value of their holdings from 1948 to 1951. However, by 1956, huge loans from the World Bank and big commercial banks in London, New York and South Africa resulted in debilitating foreign debt; financial outflows reaching 14% of the Central African Federation (Northern and Southern Rhodesia – today’s Zambia and Zimbabwe, respectively). This was further exasperated by the copper market crash affecting the economy of Northern Rhodesia. State-capitalist planning intervention began to take place in Southern Rhodesia by the late 1950s (Bond & Manyanya, 2003).

12.7.1.3 UDI and second period of deglobalization

By 1965, the Unilateral Declaration of Independence (UDI) led by Ian Smith, in a response to racial reform from Britain and the rest of the World, resulted in international sanctions, forcing Zimbabwe into developing an even greater “import substitution” economy, mostly from domestic demand expansion and diversification of already existing industries. The result was one of the World’s fastest growth rates of 9.5% annually from 1966-1974. Exchange controls trapped local financial resources and profits of multi-nationals (Bond & Manyanya, 2003).

12.7.1.4 Civil war and economy of scale

The civil war of the 1970s (40,000 civilian deaths, 50% of the white population emigrating), drought, high oil prices and lack of foreign exchange began to result in economic stagnation. Local industry began diversifying into luxury goods for the white market, as opposed to the black consumer market; a niche that would have provided a much greater regional outlet after the end of UDI and sanctions. Industrialization was running into economy-of-scale problems with an over-production of these luxury goods to a limited white settler market, which at its maximum was 250,000 compared to the lowly paid black worker whose purchases accounted for more than 50% in the turnover of furniture, clothing, footwear, etc. (Bond & Manyanya, 2003).

The civil war resulted in a 40% reduction in economic output from 1976-1979, leading to the 1979 Lancaster House Agreement (guaranteeing white retention of landholdings). This, along with the indecisive military victory of Zimbabwe African National Union – Patriotic Front (ZANU-PF) – Zimbabwe African People's Union (ZAPU), as well as nationalist infighting, left much of the economic power in the hands of the whites, while conceding political control to black Zimbabweans. White Rhodesians and the West were stunned by the 95% turnout of black voters in April 1980 and the victory of Robert Mugabe's ZANU party (62% of the vote) compared to only 8% for Bishop Abel Muzorewa's moderate collaborationist party whom they hoped would win (Bond & Manyanya, 2003). One of the key components of Mugabe's platform was land reform, already discussed in Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife.

12.7.1.5 Inheritance of colonial debt by newly independent Zimbabwe

Robert Mugabe inherited a colonial debt based on foreign loans (Bond & Manyanya, 2003):

- US\$ 5.3 million in multilateral debt – Kariba Dam debt;
- US\$ 97.9 million in bilateral debt;
- US\$ 593.9 million in private debt;

In 1980 alone, more than US\$ 65 million was required in debt servicing. Bond and Manyanya (2003) have advocated defaulting on these colonial loans, saying that they were used in the uneven development of settler capitalism, and forced black Zimbabweans to pay twice for colonial oppression in what they call “Odious (detestable) Debt”, these loans being taken out to use and repress them as low-paid slave labor to build the colonial economy and then being asked by the International Finance Institutions (IFIs) and banks to pay back the money (Bond & Manyanya, 2003). Colgan (2001), Bond (2002) and Stiglitz (2002) believe that colonial and post-colonial Odious Debt, often part of Cold War politics to assure alignment with the West, contracted by dictatorships or repressive regimes and used to strengthen the hold of these regimes, are illegitimate; including the Apartheid-caused debt inherited by South Africa, and should be cancelled.

12.7.1.6 Beginning of neo-colonialism

With the flight of so many whites, a black middleclass began emerging, moving onto white farms, suburban homes and taking up jobs left behind. By 1974, with the help of the World Bank, local European businessmen created the Whitsun Foundation to make loans to this emerging black middleclass. Bond and

Manyanya (2003) contend that the national development plan laid out by this foundation was a blue print for neo-colonialism:

- Cuts in social spending;
- User fees for social services;
- Opening up (Liberalization) of trade and financial markets (e.g., free-trade – or no trade barriers to protect local industries;
- High interest rates;
- Base economy on exports (even if mostly raw materials);
- Privatization of state parastatals; and
- Deregulation.

Excess production capacity through the 1980s was still a major problem, due to the limited buying power of the majority of Zimbabwe's citizens who remained poor (Bond, 1998 *In: Bond & Manyanya, 2003*).

Throughout the 1980s, the majority of Zimbabwe's white-owned domestic manufacturers were oriented to the global market, but lacking state of the art technologies from a protected national market in which they had no competition. Foreign exchange loans were made to these owners through the World Bank Manufacturing Rehabilitation Loan (1981), the Bank Manufacturing Loan (1983) and the Export Incentive Scheme, in addition to being allowed a generous depreciation. To increase export revenues, currency was periodically devaluated. In 1984/85, the Zimbabwe Dollar was devaluated by 40%, along with budget cuts and a reduction of the maize subsidies. The main beneficiaries were agricultural and mineral exporters – raw products (Bond & Manyanya, 2003), but with no upgrades in manufacturing capabilities allowing for the added value of transformation to be retained in Zimbabwe.

12.7.1.7 Zimbabwe's economic structural adjustment program (ESAP) and de-industrialization

By 1990, Zimbabwe had adopted ESAP and moved towards becoming a one-party state. Export orientation and a high debt crisis allowed what some call, “petite-bourgeois leadership” that abandoned alliances with workers and peasants, emerging as the new ruling class while forming an alliance with foreign and local institutions needed to maintain their power. Real wages were kept low, with excess profit accruing to capital – thus, the majority of the workers would be poorly paid to maximize profits for the owners (Hinds, 1990 *In: Bond & Manyanya, 2003*), but as a result, would have low buying power needed to purchase manufactured products. A lower black middleclass was built through the bureaucracy based on corruption and patronage, which identified more with Washington (i.e. World Bank, IMF and USAID) than the people (Murapa, 1977 *In: Bond & Manyanya, 2003*). This resulted in a high level of foreign debt.

International financial interests gained dominance in the local economy. As trade and financial restrictions were removed, Zimbabwe entered into an economic depression, exacerbated by droughts in 1992 and 1995. More debilitating was Zimbabwe's de-industrialization and crash in workers' standard of living resulting from SAP policies. ESAP failed miserably (Bond & Manyanya, 2003):

- Between 1991 and 1995, GDP growth averaged 1.2%;
- Inflation was 30% from 1991-1995 instead of the targeted 10%; and
- The budget deficit was more than 10% of GDP down from the targeted 5%.

The foreign exchange controls were dismantled, becoming market driven. Leading businessmen benefited from luxury good imports, declining real wages

and newfound ability to move money out of the country. South Africa dropped its free-trade arrangement (1964 - 1992) with Zimbabwe, resulting in a massive trade deficit. The 1991 Open Guaranteed Import License resulted in imports more than doubling beyond projections, many being luxury goods. Under this license raw materials and machinery could also be imported. However, in retaliation for South Africa's refusal to renew the free-trade agreement, South African imports were taxed by Zimbabwe customs, finished products being taxed less than raw products. As a result, the trade deficit exploded (Bond & Manyanya, 2003). The capacity to export was weak:

- Zimbabwe failed to qualify as least-developing country for trading purposes;
- Trade liberalization tended to turn manufacturers into traders, manufacturers tending to import cheaper rather than produce products locally, which were more costly; and
- Because of failures in democracy, they did not qualify for export concessions under the U.S. African Growth and Opportunity Act (AGOA) (see, Chapter 13, Section, 13.13.6.2, AGOA).

The manufacturers' contribution to GDP fell 18% during the 1990s. De-industrialization ravaged the textiles, metals, transport equipment and clothing manufacturers. One problem was that the buying power of the wage earner significantly decreased. Average annual earnings as a percentage of 1980 levels declined (Bond & Manyanya, 2003):

- Civil servants, -65%;
- Domestic workers, -62%;
- Construction workers, -56%;
- Teachers, -50%;

- Farm workers, -48%;
- Miners, -20%; and
- Manufacturing employees -19%.

The manufacturing sector output crashed from peak 1991 levels and the standard of living of the average Zimbabwean worker was devastated. Lower wages did not result in new jobs, as industry was shutting down, not expanding, a tiny fraction of the annual 200,000 school leavers finding employment (Bond & Manyanya, 2003). Local buying power thus collapsed, as did standards of living.

Total formal-sector jobs, including agriculture, rose from just under a million at independence to 1,244,000 in 1991 and then remained flat. Urban employment rose from 454,000 in early 1980 to 620,000 in 1991, falling to 590,000 by the end of 1995. Average annual earnings, after inflation, rose only $\frac{1}{2}$ (0.5) % per year from 1980-1990, then fell by more than 10% annually from 1991-1995.

12.7.1.8 Devaluation

The Zimbabwe dollar lost (Bond & Manyanya, 2003):

- 70% of its value against the U.S. dollar between 1980 and 1990; and
- Another 67% from 1991-1995.

In 1995, there were about ZD\$ 7/US\$ 1. By November, 2003, the official exchange rate was ZD\$ 847/US\$ 1, while the black market rate was ZD\$ 6,000/US\$ 1 (SABC, 2003), climbing to a black market rate in March 2007 of ZD\$ 25,000/US\$ 1 (see Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife).

12.7.1.9 Inflation

Inflation averaged 13.4% from 1980-90 and 27.6% from 1991-95 under ESAP (Bond & Manyanya, 2003), projected to climb to 10,000% inflation by 2008 (see Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife).

12.7.1.10 Decline in social programs

In the early 1990s, under ESAP, workers and poor suffered from cost recovery policies (user fees) for health and education, resulting in a reversal in these sectors made in the 1980s.

In the 1980s, Zimbabwe had (Bond & Manyanya, 2003):

- Reduced infant mortality from 86 to 49/1,000 live births;
- An immunization rate that improved from 25% to 80%;
- A life expectancy that increased from 56 to 62 years; and
- A doubling primary school enrollment.

In the 1990s (Bond & Manyanya, 2003):

- Primary school dropout increased, especially among girls due to school fee increases;
- Per capita spending on health care fell by 20%, while HIV/AIDS hit pandemic levels; and
- Health workers and teachers left the public sector for better paying jobs, often overseas (e.g., nurses recruited for hospitals in England, a similar problem to South Africa in 2004).

In essence, Zimbabwe and the rest of the developing world were forced to adopt structural adjustment policies, taking steps that the Western capitalism had never imposed on itself. In the West, starting in the late 19th century, redistribution softened the harshest effects of capitalism through such social safety-nets as progressive taxation, social security, minimum wage, worker safety regulations, antitrust laws, free education, reasonable health care and unemployment insurance; something that Westerners take for granted. Meanwhile, ESAP policies discouraged such government subsidies, encouraging *laissez-faire* economics, resulting in extremes in lifestyles between the elite, virtually no middleclass and the extreme poor, a form of capitalism abandoned by the West a century ago (Chua, 2003). ESAP policies favored elite, the “market dominant minorities” such as the Lebanese in West Africa, the Indians in East Africa, the Tutsi of Rwanda/Burundi and the whites of Southern Africa. With little or no middleclass as a buffer, these economic inequalities ultimately result in a backlash by the majority poor against the rich minority, disrupting the economy (Chua, 2003) (e.g., irrational land reform against whites in Zimbabwe, riots in Zambia against the Indians, kicking all Indians out of Uganda during the Obote/Amin era, 2003/2004 rioting and violence forcing many French to flee the Ivory Coast, and in Kenya the anti-white movement in 2004 and ethnic Kikuyu cleansing in 2008) and in the extreme, the genocide seen against the Tutsi (see Chapter 5, Section 5.7.1.3, Improperly planned land tenure and impacts on wildlife and conflicts between pastoralists and small-scale farmers, Amboseli and Maasai Mara, Kenya & Chapter 11, Section 11.6.4, Dangers of Economically Repressed Majority Being Handed Political Power through One Man One Vote Elections).

12.7.1.11 Export-led growth a fantasy

As in most of Africa during the neo-liberal epoch, exports increased but the economy declined. As every country was encouraged to export more, the global

prices of raw materials fell dramatically during the 1980s and 1990s (Bond & Manyanya, 2003). Since 1980, the value of a basket of Sub-Saharan export products has been cut by about 50% (half) compared to the value of imports from the North (Toussaint, 2001 *In:* Bond & Manyanya, 2003). Under development could not be solved with more Washington-based loans. The foreign debt treadmill and the Balance of Payments (BOP) crisis pushed foreign debt in Zimbabwe as a percentage of GDP from 8.4% to 21.8% from 1991-1996 (Bond & Manyanya, 2003).

Bond and Manyanya (2003) believe that Zimbabwe's post-independent government was driven into a cul-de-sac by the neo-liberal policies of ESAP, both locally and globally. Around 1997, when it became evident that ESAP was incapable of lifting Zimbabwe from chronic dependency, actually exacerbating under-development, political degeneration was the next logical process as a means of clinging on to power.

12.7.1.12 Impacts of structural adjustment on the wildlife and parks estate in Zimbabwe

The net result of structural adjustment on Zimbabwe's Department of National Parks and Wildlife Management (DNPWM) was a loss of 250 staff, all ministries being required to cut their staff by 10%. This resulted in a loss of an important skill base that had already been fleeing because of low salaries and poor moral, to NGO's and the private sector (Duffy, 2000). Some of the "white flight" can also be attributed to dissatisfaction by white technicians and managers who had fought in the liberation war, over being controlled by a black government. The ESAP reforms resulted in operational expenditures in the Wildlife and Parks Estate declining from US\$ 24/km² in 1988 to US\$ 2.63/ km² by 1993, along with devaluation of the Zimbabwe dollar and rising inflation (Duffy, 2000). This

crippled the ability of the government to undertake the necessary management of its protected areas (see Chapter 10, Section 10.5, RHINO, TRADE OR TRADE CONTROL, WHAT'S BEST FOR CONSERVATION?). Recommendations at privatizing the DNPWM and/or tendering out services, as proposed by the World Bank, were seen by some elements of the ruling ZANU-PF party as intended to empower the whites once again – and rightfully so, since most black Zimbabweans had little training in the tourism and safari industry, links to the markets or the finances to run such operations (see Chapter 11, Section 11.6.3.1, Patronage politics, Zimbabwe's Department of National Parks and Wildlife Management (DNPWM)).

12.7.2 Famine in Malawi

Malawi's 2002 famine was the result of selling off the country's grain stocks to repay commercial bankers at the advice of the IMF (Bond, 2002) (see Section 12.4.4.5, Impacts of structural adjustment on maize production in Malawi).

12.7.3 Famine amongst Food Surpluses in India – Lessons for Africa

Of the 830 million hungry people worldwide, a third (33%) of them live in India (Jensen, 2002; Shiva, 2002). It is estimated that 200 million out of 800 million Indians do not have enough land, income or access to food transfers to secure adequate calories (Eicher & Staatz, 1990; Madeley, 2002). Yet in 1999, the Indian government had 10 million tons of surplus food grains, mainly rice and wheat. In the year 2000, that surplus increased to almost 60 million tons - most of it left in the granaries to rot (Jensen, 2002; Shiva, 2002) while waiting to be exported (Madeley, 2002).

“Instead of giving the surplus food to the hungry, the Indian government was hoping to export the grain to make money. It also

stopped buying grain from its own farmers, leaving them destitute. The farmers, who had gone into debt to purchase expensive chemical fertilizers and pesticides on the advice of the government, were now forced to burn their crops in their fields. At the same time, the government of India was buying grain from Cargill and other American corporations, because the aid India receives from the World Bank stipulates that the government must do so. This means that today India is the largest importer of the same grain it exports. It doesn't make sense - economic or otherwise" (Jensen, 2002).

People are starving (in India) because the policy structures that defended rural livelihoods, access to resources and markets and hence, entitlements and incomes, are being systematically dismantled by structural adjustment programs, driven by the World Bank and by WTO rules imposing trade liberalization. Deregulated imports are a major cause of poverty and famine in countries like India. Globalization has dismantled the systems, which guaranteed domestic market access for farmers, a system which brought food security to the poor. India's domestic production of edible oil has been effectively wiped out, as highly subsidized soya from the U.S. and palm oil from Malaysia flood the market due to lack of adequate import controls. Imports now account for 70% of the domestic consumption of edible oil. This has resulted in coconut farmers in Kerala blockading their local harbor to protest against such imports. Groundnut farmers and soya bean farmers in a number of areas mounted demonstrations against this attack on their livelihood. As a result, they were shot at (Shiva, 2002).

12.8 CORRUPTION AND FAILURE OF IMF/WORLD BANK PROGRAMS

There "is no real impetus for change because the people who are paying the price for this reckless lending and borrowing are the ordinary, poor citizens who are often unable to raise their voices in protest. The lending institutions can keep rescheduling the loan and adding interest; the contractor gets paid, the borrowing government

gets its cut and will probably be long gone when the people find out what has really been going on. The system works very well for elites in both countries, and unless a new open, transparent system is established, it is likely to continue...The World Bank's own evaluation of project performance in the 1990s showed that in the poorest countries, and in South Asia and Africa, between 60% and 70% of projects failed:

...In Nigeria at least 61 development projects financed by more than \$5 billion in foreign loans have either failed or never opened, according to a government commission...

...Tanzania owes the World Bank more than \$575 million for 26 failed agricultural projects, according to the Tanzania Coalition on Debt and Development. The World Bank's own Operations and Evaluations Department admitted in 1998 that it failed to involve Tanzanians in appraising the projects before they went ahead, and that 'pilot projects went to the Board as proven undertakings; early warnings of failings by World Bank technical staff and co-financiers were ignored' " (Hanlon & Pettifor, 2002).

"Structural adjustment policies have placed considerable emphasis on measures to reduce the size of and resources allocated to the civil service in Africa. However, and contrary to expectations, in spite of such measures, corruption has remained unabated, even showing a tendency to rise and penetrate various aspects of economic and social life...role of domestic and international business groups in corrupting the state apparatus is almost totally disregarded...economic corruption related to granting government contracts and privatization of public enterprises do not appear to be a serious source of concern for the African poor" (UNCTAD, 2002) [(see Chapter 11, Section 11.11.6.2, Modern conservation and the Baka Pygmy that discusses impacts of privatizing marketing boards; Section 11.11.7, Case study Bongo in the Congo (Brazzaville) and Chapter 12, Section 12.3.4.3, Structural adjustment and creation of government bourgeoisie].

Poor people are often ignorant of the issues and are too worried about trying to survive to take the time to learn.

12.8.1 South Africa/Lesotho

In the mid-1980s, as the anti-Apartheid sanctions campaign was gaining global force, conservative forces were looking for ways to support Apartheid South Africa. The European Community [now European Union (EU)] and World Bank agreed to back a \$2 billion dam in Lesotho (totally surrounded by South Africa) to supply water to South Africa (see Chapter 7, Section 7.6.1, Lesotho Highlands Water Project [LHWP] and Chapter 13, Section 13.11.2, Lesotho Highlands).

12.8.2 The Meltzer Commission, Restructuring the IMF and World Bank

The U.S. Congressional Meltzer Commission (2000) recommended

“that the IMF be restructured as a smaller institution with three unique responsibilities which, if properly performed, would increase global stability, improve the functioning of markets, and help countries improve domestic monetary and fiscal policies:

1. to act as a quasi-lender of last resort to solvent emerging economies by providing short-term liquidity assistance...that would not retard the development of those institutions within the recipient country that would attract capital from commercial sources;
2. to collect and publish financial and economic data from member countries, and disseminate those data in a timely and uniform manner that permits market participants to draw useful information about member countries' economic performance across time and across countries; and
3. to provide advice (but not impose conditions) relating to economic policy...”.

Similarly, the Zedillo Report (High-Level Panel on Financing for Development) recommended that the IMF streamline conditionalities and that borrowing countries should be given the opportunity to choose their own path to reform (United Nations, 2001).

With regard to the World Bank reform, the Meltzer Commission (2000) recommended that the World Bank be renamed World Development Agency and that the African Development Bank/*Banque Africaine de Developpement* (ADB/BAD) be renamed the African Development Agency. Additional reforms include (Meltzer Commission, 2000):

1. “Grants should replace the traditional Bank tools of loans and guarantees for physical infrastructure and social-service projects. Grant funding should be increased if grants are used effectively...”
2. Development Agencies should be precluded from financial crisis lending...
3. The World Bank should become the principal source of aid for the African continent until the African Development Bank/*Banque Africaine de Developpement* (ADB/BAD) (Agency) is ready to take full responsibility.....
4. The World Development Agency should concentrate on the production of global public goods and serve as a centralized resource for the regional agencies. Global public goods include improved treatment for tropical diseases and AIDS, rational safeguarding of environmental resources, inter-country infrastructure systems, development of tropical agricultural technology, and the creation of best managerial and regulatory practices.....
5. Private-sector involvement by the development institutions should be limited to the provision of technical assistance and the dissemination of best practice standards. Investment, guarantees, and lending to the private sector should be halted....
6. The World Bank and the regional development banks should write off in entirety their claims against all Heavily Indebted Poor Countries (HIPC)s that implement an effective economic development strategy under the Banks' combined supervision.
7. The United States should significantly increase its support of effective programs to reduce poverty. The six dollars per capita currently spent is too much for ineffective programs but too little for effective programs”.

The Bush administration proposes that 50% of the International Development Association (IDA)⁴⁹⁵ resources be distributed as grants, not low-interest loans. Contributions from the USA would be tied to the future effectiveness of IDA (established in 1960 to provide soft “concessional” loans) programs. The US Treasury Secretary Paul O’Neill (now ex-Secretary) has said that giving money to health, education and sanitation projects in developing countries would be more effective than giving loans to governments “ ‘that sometimes waste the resources’ ” (House of Commons, 2002) (see Chapter 11, Section 11.13, AREAS WHERE FOREIGN AID CAN MAKE A DIFFERENCE – HEALTH AND EDUCATION).

It appears that there is little evidence on the ground for these reforms (Madeley, 2002). While lauding the National Security Strategy of the United States that would aid countries with appropriate national reforms, improve the effectiveness of the World Bank and other development banks to raise living standards, insist on measurable indicators of development, provide large amounts of development assistance in the forms of grants over loans, secure public health, emphasize education and continue aiding agricultural development, Sachs (2005) found a disconnect between rhetoric and financial commitment by the U.S. Government.

⁴⁹⁵ The World Bank is made up of the International Bank for Reconstruction and Development (IBRD) plus the International Development Association (IDA).

12.9 THE WAY FORWARD

The International Labor Organization (ILO) (2004) believes that there is a glaring inequity in the global trading system in trade barriers by the North against labor-intensive goods produced in the South.

“These are items in which the South has comparative advantage, and which are vital for their growth and development prospects. On this, we share the broadly held view that unfair barriers to market access must be substantially reduced, and that this will provide important opportunities to developing countries. But we must also point out that this will not be a panacea. The interests of the LDCs will have to be safeguarded through the WTO provisions for Special and Differential Treatment to nurture their export potential. South-South trade barriers remain high and developing countries can do much to help themselves through reducing these. In addition, certain principles other than just fair market access must also be respected in order to make the global trading system fully fair to all” (ILO, 2004).

12.9.1 Export Transformed Products; It’s Not Rocket Science

“If a society spends one hundred dollars to manufacture a product within its borders, the money that is used to pay for materials, labor and, other costs moves through the economy as each recipient spends it. Due to this multiplier effect, a hundred dollars worth of primary production can add several hundred dollars to the Gross National Product (GNP) of that country. If money is spent in another country (e.g., buying transformed products from another country), circulation of that money is within the exporting country. This is the reason an industrialized product-exporting/commodity-importing country is wealthy and an undeveloped product-importing/commodity-exporting country is poor” (Smith, 1994 *In:* Shah, 2002).

“An economy with a higher share of manufacturing in total value added is generally less exposed to external shocks, price fluctuations, climatic conditions and unfair competition policies” (UNECA, 2004).

This is where Africa must head, into transforming raw products in Africa, prior to exporting them.

12.9.2 Changes Needed by OECD “Developed” Countries

There is a need for a more collective voice and through regional organizations, such as the New Partnership for Africa’s Development (NEPAD), comes the capacity to negotiate international agreements (United Nations, 2002). Palmer and Kline (2003) believe that “to fight a war on unfair-trade rules, the G-8 countries (G-7 + Russia) should:

- Immediately stop using subsidies and export credits that cause over-production and dumping of surpluses in developing countries.
- Open their own markets to all products from Africa and other low-income countries.
- Amend WTO patent rules in order to improve developing countries’ access to affordable, generic medicines for HIV/AIDS and other diseases, as promised in Doha in 2001”.

To some degree, less expensive generic anti-retro viral drugs are beginning to become available and/or drug companies have drastically reduced the prices in Africa (see Chapter 11, Section 11.13.2.2, HIV/AIDS).

“Documented in previous UNCTAD reports, such countries continue to face significant trade barriers in their more affluent trading partners, notably the industrial countries, in the two sectors which can make the greatest contribution in these respects, i.e. agriculture and labor-intensive manufactures. In this respect, some recent initiatives, including the Everything but Arms (EBA) initiative of the European Union (EU) (see Chapter 13 Section 13.13.6.3, Other agreements) and the African Growth and Opportunity Act (AGOA) of the United States (see Chapter 13,

Section 13.13.6.2, AGOA) are significant steps in the right direction. Nevertheless, continued protectionism in agriculture constitutes perhaps the most important external impediment to resource mobilization in many developing countries in Africa, where this sector could provide considerable ‘vent for surplus’ needed to generate resources for creating jobs in industry...The expansion of industry requires exports and this is one of the major external obstacles which, far from having been eliminated, is becoming worse...Clearly, the long-term solution lies in improving the productive capacity of the region and resolving the deep-seated imbalances and distortions in the international trading system in areas of export interest to African countries. There is now a consensus among the major international institutions that the cost of protectionism in industrial countries for Africa tends to be very high and that market access for African products needs to be improved. However, the trade policy advice to the African countries needs to be based on a realistic assessment of what can be achieved in this respect. Many of the increased Balance of Payments difficulties in developing countries today, including those in SSA, have their origin in the failure to pay adequate attention to forces of protectionism in industrial countries in designing trade policies in structural adjustment programs” (UNCTAD, 2002).

Additional Recommendations (Welch, 2001):

- The U.S. should work to refocus the IMF on short-term lending and ensure that PRSPs provide for genuine country-driven economic development plans;
- Washington’s priority should be the encouragement of sustainable, equitable development that benefits local people rather than (just) Transnational Corporations (TNCs); and
- The U.S. should push for greater transparency and for social and environmental impact assessments of adjustment lending. The U.S. should also insist on delinking structural adjustment conditions from debt relief.

12.9.3 Role of Sub-Saharan African Governments in Diversification through Industrialization

Trade liberalization policies should clearly benefit the poor and trade liberalization in the South should not be encouraged in economic sectors where the U.S. and Europe retain trade barriers (Welch, 2001).

While some economists believe that opening markets will result in economic growth and development, making one more competitive, many economists analyzing the developing world believe that countries should open markets once they become competitive (Steenkamp, *pers. comm.*).⁴⁹⁶ UNECA (2004) sums up this issue by stating that

“the industrialized countries need to be aware of the need for a generous timeframe for liberalization if African economies are to be able to strengthen supply-side capacities and compete adequately in global markets...export diversification is rarely, if ever, achieved in a strictly laissez-faire policy environment”.

Quoting the Zedillo Report (High-Level Panel on Financing for Development), it is argued that a priority for any Development Round of the WTO is the need to consider how to legitimize time-bound protection of certain industries, by country, in the early stages of industrialization (UNECA, 2004):

“ ‘However misguided the old model of blanket protection intended to nurture import substitute industries, it would be a mistake to go to the other extreme and deny developing countries the opportunity of actively nurturing the development of an industrial sector.’ ”

⁴⁹⁶ Ezra Steenkamp, Department of Agriculture, Private Bag X791, PRETORIA, 0001, Tel: +27 12 319 6110, e-mail: <mailto:ezras@nda.agric.za>.

One such example is that the “East Asian Miracle” (Singapore, China and Malaysia) was brought about by state interventions, including states playing an important role in fostering export competitiveness and by using mechanisms, including the maintenance of export-friendly effective exchange rates and the granting of large subsidies to exporters; trade policies being part and parcel of broader national development strategies (UNECA, 2004). The Asian Newly Industrialized Countries (NICs) tended to adopt import substitution in the 1950s and 1960s until their nascent industries were competitive, followed by export-led industrialization in the 1970s and 1980s, at all times government playing a major role in helping these economies develop (Alemayehu, 2000). In the East Asian Miracle, government took a more active role in promoting economic growth, abandoning the religion that the market knows best, intervening, as in the West, in technology transfer, education and health, and industrial planning and coordination (Chomsky, 1999). In the East Asian Miracle,

“There are important lessons to be learned here for Africa, although this goes against the contemporary paradigm concerning the merits of trade liberalization, which focuses excessively on removing the impediments to imports, but provides little guidance regarding how to strengthen export capacity and promote diversification” (UNECA, 2004).

Alemayehu (2000) argues that opening up a nascent industry to “free-trade” prior to the industry becoming competitive in the global market is “tantamount to forcing a baby to run before crawling” and results in deindustrialization, as they cannot compete against established industries with strong market links.

Sanctions, in essence, created a protected market in both Zimbabwe (Southern Rhodesia) (see Section 12.7.1.1, Import substitution) (Alemayehu, 2000) and South Africa. South Africa would likely not have developed its automotive and arms industries, among others, if it had not been for sanctions, in essence, *de facto*

protected industries. South Africa, the only truly industrialized nation in Sub-Saharan Africa, maintains a number of protective trade tariffs, just as the OECD countries, such as anti-dumping controls to protect key industries (Mabiletsa, 2003). For instance, South Africa protects their sugar industry with import tariffs, making it about twice as expensive for local consumers than the world price (Steenkamp, *pers. comm.*). Section 12.2.4 (Agricultural Tariffs and Subsidies, Hiding Domestic Trade and Production Subsidies, Green, Blue and Amber Boxes) discusses percent Producer Subsidy Equivalent/Producer Support Estimate (PSE)/(%PSE) that help make South African products competitive internationally and/or protect South African producers.

Likewise, Mauritius, whose economy is based on textiles, sugar and tourism, has a market that is very protected from imports. Its export sector has been kept open by segregating the export sector from the import sector (UNECA, 2004):

- Duty-free access provided to all imported inputs (e.g., raw products used in manufacturing), resulting in a competitive export sector;
- Tax incentives to firms operating in the Export Processing Zone (EPZ); and
- Labor market for the export sector segmented from the rest of the economy, with greater flexibility in the EPZ regarding overtime payments and discharging workers.

UNECA (2004) found that

“over the last two decades many African countries have abandoned attempts at providing financial and technical support for domestic industry. Yet providing such support need not be controversial”:

- Selective interventions by governments in overcoming the market and institutional failures in building the capabilities required for export sector development;
- Develop generalized industrial policy targeted at certain kinds of activities (e.g., investment, research and development, training, etc.) rather than selective interventions to support particular industries or firms;⁴⁹⁷ and
- Coherent policies are required across ministries, including trade, employment, education agriculture, transport, etc. to increase competitiveness of African economies.

A Trade Competitiveness Index (TCI) for African countries has been developed as a tool for policy makers in Africa to be able to identify where the competitive shortcomings of their countries lie compared to other African countries.

“Using a total of 34 indicators, the TCI is divided into three components, each capturing a different dimension of trade competitiveness: a Trade Enabling Index, reflecting the overall economic and political environment's conduciveness to trade; a Productive Resource Index, measuring the availability of direct inputs to production, such as land and labor force; and an Infrastructure Index, measuring the availability of indirect inputs such as a physical infrastructure that enables the movement of goods and services. These three sub-indices received equal weighting to comprise the TCI, which in turn allows the identification of the most competitive countries in terms of trade as well as identification of bottlenecks to an improved trade performance” (UNECA, 2004).

This authors believe that a major emphasis on education and moving into an industrial/high technology information age economy is the only hope of saving the people and the natural systems which traditionally supported them, but which

⁴⁹⁷ This is the path that industrialized countries like the U.S. took supporting national research and development programs and infrastructure projects, along with a complicated system of tax breaks, etc. (UNECA, 2004).

are being mined in an unsustainable manner as a result of being out of balance with the ever-growing human population and antiquated government policies regarding resource and land tenure. UNECA (2004) believes placing an emphasis on industrialization will be critical to economic development. This also means diversification through transforming the raw products, which are currently the basis of most Africa's economies, in Africa rather than in the West. Obtaining this added value will 1) employ more people, 2) increase their standard of living assuming Africa assures that slave wages are not paid, 3) help urbanize Africa in a civil manner, avoiding the slums, pollution and poverty of places like Nairobi, Kenya, that support the current industrial process based on slave labor and little or no environmental pollution controls, 4) urbanization will take pressure off the rural natural resources and be more conducive to seeing a bit of "Wild Africa" survive, linked to empowering the people in rural Africa to become "owners of these natural systems" and the right to manage and benefit from them, 5) an urbanized and better educated society will be more environmentally conscience since they will hopefully no longer only worry about survival from day to day – "the subsistence mentality", 6) birth rates will decline as children go from being producers in the rural economies (free or cheap farm labor – an asset) to consumers – a deficit in an urban economy and 7) with an educated middleclass there is a strong likelihood that leaders will be held accountable and that Africa will begin finding its own solutions to democracy.

Foreign capital goes where the economy is already working and the prospects of low-risk profit are good (Legum, 2002). Thus, the conditions for transparency, good governance, reinvesting national assets into infrastructure and into assuring a healthy and educated work force, will be required by African governments if they wish to attract Foreign Direct Investment (FDI).

12.9.4 Consumer Beware

“But no one at the UN or in the First World is willing to acknowledge the dream’s impossibility: the unsustainability of a world in which the Third World’s large population were to reach and maintain current First World living standards. It is impossible for the First World to resolve that dilemma by blocking the Third World’s efforts to catch up...impossible for the First World alone to maintain its present course...depleting its own resources as well as those imported from the Third World...untenable politically for First World leaders to propose to their own citizens that they lower their living standards, as measured by lower resource consumption and waste production rates. What will happen when it finally dawns on all those people in the Third World that current First World standards are unreachable for them, and that the First World refuses to abandon those standards for itself...the crudest tradeoff...encouraging and helping all people to achieve a higher standard of living, without undermining that standard through overstressing global resources” (Diamond, 2005).

Hoogvelt (2002 *In: Zack-Williams, et al.*, 2002) believes that Westerners must change their lifestyles, which are dependent on the rapacious extraction of wealth from the African continent. The first step is the recognition at the collective intellectual and emotional level that what is wrong with Africa is actually wrong with us (Westerners). In commenting on an interview with a Shell Oil Executive who blames everyone, but themselves for the human and environmental tragedy in the Niger Delta (see Chapter 13, Section 13.10.1.3, Oil and Repression in the Niger Delta – Nigeria), including a corrupt Nigerian Government and the consumer, she goes on to say:

“We are involved. We in the center and the heartland of the global capitalist system are the cause, and the excuse of much plunder, degradation and dereliction in the margins of the world. It is our own humanity that is at stake if we continue profit from this stake. Blaming Africans for complicity in this trade does not let us off the hook. Our lifestyle, and our conditions of socio-economic well-being depend on environmental plunder and pauperization in large

parts of the world, including Africa" (Hoogvelt, 2002 *In: Zack-Williams, et al.*, 2002).

12.10 CONCLUSION

Agricultural subsidies and protected markets in Europe and America have been a disincentive to the development of commercial agriculture, for both food and export in Sub-Saharan Africa. Subsidies are so contentious that talks broke down at the September 2003 World Trade Organization (WTO) meeting in Cancun, Mexico. Africa and many developing countries, feel that they have a comparative advantage for certain crops (e.g., cotton) if subsidies and trade barriers were dropped by the West, including barriers against transformed products. In July 2004 in Geneva, Switzerland, a tentative agreement was reached between the developing world and the G-8 to eliminate certain export subsidies for Western farmers in return for developing countries opening their borders to more finished products from the West. The devil is in the details and if this is a continuation of Africa exporting raw products while importing transformed products, then nothing really changes. Time will tell.

Furthermore, in many cases, subsidies to Western farmers have produced food surpluses that would otherwise be non-competitive. This surplus food, through such programs as the U.S. PL 480 Food for Peace Program and the World Food Program (WFP), is dumped into Africa and other developing countries at below market prices. While of value for drought relief and famine caused by civil wars, needless food dumping puts small and commercial farmers out of business unnecessarily. For instance, rather than dumping cheap American/European subsidized grains/food into Sub-Saharan Africa, it is preferable to help Africa feed Africa, such as by buying maize from South Africa to make up for food shortages during drought in southern Africa (see Chapter 11, Section 11.8.8, Food Aid and Impacts on Grain Production in Southern Africa), or by allowing the

sustainable harvesting of Kenya's wildlife on ranches to feed refugees in the Horn of Africa (see Chapter 11, Section 11.8.3.1, "Food for Peace" or "food for poverty", Western donor impacts on food production and wildlife management in Laikipia, Kenya). This encourages the subcontinent to continue the development of commercial agriculture to feed itself. Unnecessary external food aid shuts down agriculture. Unnecessary food dumping is not only a disincentive to grow food, but can be a disincentive to use costly agricultural inputs (e.g., fertilizers and pesticides), resulting in soil "mining", decreased production capacity, expansion into marginal areas and ultimately, deterioration of the natural resource base. The end result is short-term gains in favor of long-term declines in production capacity and biodiversity in order to maintain their income/buying power as currencies devalue and world commodity prices fall because of Structural Adjustment Policies.

Foreign aid, subsidies, structural adjustment and debt relief are all neo-colonial tools of the West to create welfare states on the African continent. We know in America, that once on welfare, it is tough to break out of this mold; it is addictive. During the Cold War, these tools of dependency were used to keep the Russians and Chinese out of Sub-Saharan Africa and to obtain critical votes in the UN. In some cases, as in Zaire (today's Democratic Republic of Congo), they were used to obtain staging grounds by the West to battle the Eastern Bloc on the African continent. The Super-Powers were the "Kings, Queens and Knights", while the people of Africa were the "Pawns" who suffered the consequences.

With the closing of the Cold War one would have thought that the West would want to help Sub-Saharan Africa, one of the resource richest subcontinents in the World while being the poorest, evolve beyond subsistence and mono-culture economies. This was not the case.

The West and the materialistic lifestyle it has created, continues to depend on cheap raw materials for its industrial complex. What struck the principal author while visiting the USA in June 2003 was how American lifestyles had changed since the 1950s. In the past, during the heat of the summer, houses were designed with screen porches, so people could literally sleep out-of-doors, while being protected from mosquitoes. Cross-ventilation and shade trees helped keep houses cool. Fireplaces were commonly used to heat homes, not just for decoration as today. Today, architectural design has changed all buildings to “closed living” conditions. Windows are not meant to be opened other than for brief periods of the year. Central heating in the winter and central air-conditioning in the summer are used in climate controlled environments, not only in the home, but the workplace and shopping malls, and where fireplaces are more for decoration and atmosphere than warmth. This lifestyle requires cheap energy. Here in South Africa, we must wear our winter coats in both our homes and workplace, while using mobile “spot” heaters to warm ourselves, or among the poor - air polluting coal.

Thus, these neo-colonial tools (subsidies, tariffs, quotas, food dumping, structural adjustment, foreign aid and debt relief) are still used to manipulate economies to allow access by the West to cheap resources on the African continent, from petroleum to COLTAN used in microchips, to coffee, cacao and timber; raw resources needed by the West to stimulate its consumer economies and supply the demands of its citizens (see Chapter 13 for details), while assuring Western farmers continue producing food, regardless of the cost.

The net result, even in 2008, is resource plundering, food dependency, spiraling poverty and low educational levels that are linked to the HIV/AIDS pandemic, loss of biodiversity, habitat degradation and poor governance. Governments living on international welfare tend to be more responsive to donors and IFIs than their

citizenry, since that is where their “bread and butter” comes from; Euros and U.S. dollars and not local taxes. The political elite, from Africa and the West, the Beltway Bandits and the multi-nationals, score big time at the expense of the masses.

Government-to-government loans do not make sense, since most of Africa does not have enough of a tax base to allow these loans to ever be paid off. In addition, such loans will not create economies that must be linked to creating enabling environments that allow the private sector to compete in a global market place. Initially, this may require some protection until emerging industries become competitive.

The next chapter will outline in some detail the traditional role of the Western private sector in Sub-Saharan Africa and innovative initiatives, such as AGOA and NEPAD, which have the potential to create a partnership with the West, instead of the current “Master-Servant” relationship that is not sustainable. If the West wishes to not only access Africa’s rich resources, but also access the wonders of its charismatic mega-fauna and unique cultures, then this is the direction we must all be moving towards as a global community. It will also help create a middleclass and related benefits; accountable governments, educated and healthy people able to participate in a global economy, as well as declining HIV/AIDS rates, among others.

African governments will be required, with initial help from the West in foreign aid that subsidizes health and education (see Chapter 11, Section 11.13, AREAS WHERE FOREIGN AID CAN MAKE A DIFFERENCE – EDUCATION AND HEALTH), until Sub-Saharan Africa’s tax base is large enough to support these areas of social welfare on their own in order to produce productive members of society that can fit into a global economy.

America and Europe should be flexible enough to negotiate the lifting of certain subsides where Sub-Saharan Africa has a comparative advantage. America and Europe need to export their technologies to Africa and, along with African countries, find incentives (e.g., low interest loans or even grants) to attract foreign investment to jumpstart the transformation of Africa's raw products on the continent, leading to industrialization and urbanization where the majority of job opportunities will be in 50 years. Industrialization may be considered a form of diversification. The developing world, including Sub-Saharan Africa, may have to consider the creation of more "OPEC" type bodies to control the availability and negotiate prices of unique or rare raw materials, and even products transformed in Africa, with the developed world.

Chapter 13

13.0 THE CURRENT AND FUTURE ROLE OF THE PRIVATE SECTOR IN SUB-SAHARAN AFRICA, RESOURCES WARS OR NEPAD?

“Behind rhetoric about self-determination, U.S. and European powers have used aid to compete with one another through colonial and neo-colonial systems. Trade and investment wars have gone on in the name of a super-project of social engineering called ‘development’ ” (Sogge, 2002).

The five pillars of American global sway in the 20th century include: “The international reach of U.S. investment banking, the emerging giantism of the military-industrial complex, the ballooning of the CIA and kindred intelligence operations, the drive for U.S. control of global oil supplies, and a close alliance with Britain and the English-speaking community” (Phillips, 2004).

“America’s Africa policy is morally bankrupt. Its commercially-influenced policy has directly promoted ethnic rivalries and some of the worst bloodshed of the 20th century. U.S. military and intelligence involvement in Africa, far from creating a sanguine and stable environment for a ‘new world order,’ has taken the continent back to another era – namely the ‘old world order’ of Western tutelage, tribal preferences, commercial chicanery and continued under-development...human rights means very little in the new world order crafted by military and economic planners in Washington. Only maximum profits engendered by unhindered access to raw materials dictate the foreign policies of Washington and its allies in London and Ottawa...America’s mercenary-influenced African foreign policy has dealt a severe blow to its traditional support for human rights” (Madsen, 1999).

This is both a global war pitting France against America and its allies, as well as an intra-continental war in which American and French proxies are used to fight

their battles where the victors reap the benefits to the detriment of Africa and Africans.

“This is like a guy who is falling from the Empire State Building who reassures his friend on the 20th floor: ‘Cool it, man. No crisis yet.’ We have already pushed Africa off the Empire State Building. But it hasn’t hit the pavement yet” (Jared Diamond, University of California *In: Rosenblum & Williamson, 1990*).

Weaknesses in global governance

“have contributed to the uneven social and economic impact of globalization. There are two main channels through which this has happened. The first is the creation of a system of rules governing the global economy that has been prejudicial to the interests of most developing countries, especially the poor within them. The second is the failure to put in place a coherent set of international economic (environmental) and social policies to achieve a pattern of globalization that benefits all people” (ILO, 2004).

The irony of the African continent is that one of the resource richest continents in the world is among the poorest and most backwards. One must ask why, but one must realize that this dichotomy between the extremes of rich and poor, in not only Africa, but also the Developing World in general, could jeopardize the idyllic quality of life of the Western Developed World. The West must come to realize, that as the largest consumer of natural resources, it cannot consume them at the expense of the rest of the World.

“But I also have a practical view, which derives from seeing people struggle to survive by exploiting the only resources available to them – namely, the natural world around them. Aiding their struggle while halting the destruction of those resources is humanity’s greatest challenge for the next century. It can be done, but only if the different needs of rich and poor countries are acknowledged. It will fail if the richer nations try to impose

solutions that effectively freeze the citizens of the less-developed nations in permanent poverty” (Leakey & Lewin, 1995).

This chapter will discuss the current and future role of the Western private sector and how they impact Africa’s economies and natural resources.

Aid agencies miss the point when they judge the rich world's rescue plans for Africa in terms of aid and debt relief. Africa's needs are on a far greater scale than the extra \$6 billion⁴⁹⁸ a year that the G-8 (G-7⁴⁹⁹ + Russia) governments plan to assign to Africa out of the \$12 billion increase pledged at the United Nations Conference on Finance for Development in Monterrey (Mexico). The total combined annual economic output of the 48 African (Sub-Saharan) countries is US\$ 300 billion, which is roughly the same as Argentina, with a human population of only 30 million compared with Africa's population of 818 million. Africa receives less than 1% of global Foreign Direct Investment (FDI) (see Section 13.13.5, Foreign Direct Investment in Sub-Saharan Africa). Aid flows are actually declining in real terms, having descended to less than half their level of two decades ago (Hampshire, 2002) (see Chapter 11, Section 11.7.1 Foreign Aid as Portion of Donor Country GNP).

To halve African poverty by 2015 in line with the UN Millennium Summit's goal, the economies of Sub-Saharan Africa will have to grow between 7% and 8% a year in real terms (World Bank, 2000; Hampshire, 2002), well above their average of a little over 2% from 1991 to 1997. This is a tall order for a continent containing most of the poorest countries in the world, the world's lowest life expectancy, the highest child mortality rates and an HIV/AIDS epidemic (Hampshire, 2002).

⁴⁹⁸Note in 2002 was US\$ 17.2 billion (see Chapter 11, Section 11.6.7, Foreign Aid and Puppet Governments – “Donor Democracy”, Table 11.4: Official 2002 development assistance (ODA = foreign aid) as a percentage of all investment inflows to Sub-Saharan Africa

⁴⁹⁹G7 consists of France, United States, Britain, Germany, Japan, Italy and Canada.

“The way to Africa's economic salvation is to build confidence in its future as a place where it is both safe and profitable to invest, persuading investors to disregard generalizations and seize the opportunities that individual countries and sectors offer” (Hampshire, 2002).

As discussed in Chapters 11 and 12, food aid and development aid strengthen the institutions that prevent progress, while weakening the institutions of the Third World, which could bring true prosperity. Aid increases the role of government and bureaucracy in the economic life of the Third World, while minimizing the role of markets and private entrepreneurship. One way of aiding Third World nations is through true “free-trade”, maybe best called “fair-trade”, lowering import barriers by the First World, allowing the Third World private sector easier access to Western markets. This will result in the opportunity to develop new industries or expand old ones. Commercial intercourse with the West, has transformed economic life in the Far East, South-East Asia, parts of Africa and Latin America (Majewski, 2002).

“It must be emphasized that free-trade alone will not solve all the problems of Third World poverty. Free-trade only increases the opportunities of the less developed nations. It will not eliminate the shackles of government regulation and intervention that dominate Third World economies. That task can only be done by the people of the Third World themselves. Yet, eliminating foreign aid and instituting free-trade will at least encourage Third World peoples to develop institutions such as private property rights and free-markets which will lead to growth and prosperity” (Majewski, 2002).

“In most of these countries - I'm thinking of Africa - people are not developing economically because they're not being allowed to. They're being oppressed politically. If you look at the development that's taken place in Asia in the past 15 or 20 years, none of that can be attributed to foreign aid. It's all investment; it all came about through change in government policies that allowed people to invest their money. I had a friend who had a business in Nairobi

a number of years ago who said he wanted to keep the business small because if you stuck your head up too high they'd chop it off. The President of Kenya (Moi) basically stole most of the successful businesses in the country, and now owns them. That's not the kind of policy that's going to foster large economic growth.⁵⁰⁰ And if the Asian model is going to apply to Africa, it's got to start slowly, and it has to start with good government. And to a certain extent, NGOs and aid organizations in these countries now help fortify a lot of bad governments" (Might Magazine, 2002).

13.1 CURRENT STATE OF AFRICAN ECONOMIES

Since Africa is still largely an agrarian region, falling agricultural productivity affects all other sectors of the economy. As discussed in Chapter 5, about 67% (2/3rds) of the labor force is employed in agriculture and 70% of the population lives in rural areas. Agricultural exports make up about 33% (1/3rd) of the total economic output and of total exports (Martin & O'Meara, 1995).

Over the last 30-40 years, agriculture and food production has grown more slowly than the population. Low and declining levels of domestic food production have been offset only partially by rapidly rising food imports. Africa has become the largest per capita importer of food globally and the largest per capita recipient of food aid. Average daily caloric intake, as a measure of well-being, was around 90-93% of minimal daily requirements between 1985 and 1995; 12-14% below less-developed countries (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*) (see Chapter 5, Section 5.3.3, Food Security in Africa and Section 5.4, HUNGER LINKED TO POVERTY).

⁵⁰⁰ Economic growth is the annual percentage rate change (from year to year) in a nation's "real" (adjusted to remove the effects of inflation) gross domestic product (real GDP).

Agricultural exports have stagnated or declined in most African countries (e.g. coffee, cocoa, cotton, groundnuts and timber). The proportion of global exports from Africa shrank from 2.5% in 1970 to 1.2% by the early 1990s. Africa's share of the world's primary commodity market has fallen from 7% to 3% over the past two decades (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*). The World Bank (2005) estimates that Africa's share of world exports has dropped from 3.5% in 1970 to less than 2.0% in 2003. If South Africa is left out, the cumulative trade losses between 1970 and 1997 were 120% of the GDP (Guest, 2004). Since most African countries depend on one to three export commodities, whose production is declining. This has resulted in a decline in foreign exchange and a reduced capacity to import needed goods (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*). From 1980 to 1993, imports to France from Sub-Saharan Africa (SSA) dropped from 10.8 to 5.3% of all imports, and exports from France to SSA dropped respectively from 13.5% to 6.9% of all exports (Huliaras, 2002) (see Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA).

The per capita GNP or Gross National Income (GNI)⁵⁰¹ in Sub-Saharan Africa has actually declined by 0.2% between 1990 and 2001, while life expectancy has decreased and people living in poverty have increased (Ignatius, 2003). Sub-Saharan Africa currently has 11% of the world's population, but only 1% of global trade. Since the 1970s, deteriorating terms of trade have cost Africa more than seven times the amount it has gained in development aid (Palmer & Kline, 2003) (see Chapter 12, Section 12.3.4.4, Trade and structural adjustment policies (SAP), Declining "Terms Of Trade" Associated With Structural Adjustment).

⁵⁰¹ Previous terminology

Gross National Product (GNP)

per capita GNP

Source: World Bank (2004)

New terminology

Gross National Income (GNI)

per capita GNI

Some countries have seen growth in their GDP⁵⁰² in recent times (Commission for Africa, 2005). What this means is that,

“while many African countries have historically managed to generate periods of rapid growth, few have been able to sustain it for long periods at the levels needed... (a) 5% annual growth is needed simply to keep the number of poor from rising and halving severe poverty by 2015 will require annual growth of more than 7% along with a more equitable distribution of income... A highly unequal distribution of income significantly reduces the positive impact of growth on poverty. Inequality is particularly high in Lesotho, Botswana, Sierra Leone, the Central African Republic, Swaziland and South Africa. But it is most severe in Namibia, which has one of the highest levels of inequality in the world. Relatively equal distributions of income in Ghana and Uganda have meant that growth in these countries has been linked more strongly to poverty reduction... The critical challenge is to ensure poor people are able to participate in these opportunities. That requires government action. Strengthening the assets of poor people – including their human capital, such as health and skills, physical capital, such as land and property, access to finance and their natural environment – enables them to participate more effectively in markets, while the economic, legal and governance environments shape the opportunities open to them” (Commission for Africa, 2005).

However, Sub-Saharan Africa is also the only region where the annual growth of per capita GDP or Gross Domestic Product⁵⁰³ has been negative, at -1.0% between 1975 – 1999, compared with 6.0% for East Asia and the Pacific and 2.3% for South Asia (Roman, 2003). Similarly, according to Sogge (2002), between 1960 and 1980 per capita GDP increased by 36%, while between 1980 and 1998, during the period of structural adjustment (free-market

⁵⁰² For an explanation of GDP versus GNP/GNI, see Footnote 48, Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA.

⁵⁰³ Of Africa’s ten richest countries, with a per capita GDP over US\$ 3,500, nine lie partly or entirely in temperate zones: Egypt, Libya, Tunisia, Algeria and Morocco north of Sub-Saharan Africa, as well as Swaziland, South Africa, Botswana and Namibia in Sub-Saharan Africa, with Gabon being the continent’s only truly tropical country making the list (Diamond, 2005).

fundamentalism), the per capita GDP fell by 15% in SSA. Zack-Williams (2002 *In: Zack-Williams, Frost & Thomson, 2002*) estimates that Sub-Saharan Africa's per capita GDP fell from US\$ 671 in 1975 to US\$ 245 by 1997 [see Chapter 12, Section 12.3.4.4, Trade and structural adjustment policies (SAP)]. This implies that, among other things, the human population is growing faster than the GDP (Alemayehu, 2000; Sachs, 2005), making it difficult for Sub-Saharan African economies to improve the standard of living of the average family. To put it in simple terms, based on defining poverty as living on less than US\$ 1/day,⁵⁰⁴ unimaginable to most Westerners, unless there are major changes in the status quo of Sub-Saharan Africa's economies per capita, the population living in poverty will only increase,

“46.4% of the population in Sub-Saharan Africa were living in households with incomes/person of less than \$US 1/day in 2001. This compared to 31.3% in South Asia, 14.9% in East Asia, 9.5% in Latin America and the Caribbean, 3.6% in Eastern Europe and Central Asia, 2.4% in Middle East and North Africa. In terms of absolute numbers, India had more poor people than all Sub-Saharan African countries put together (358.6 million compared to 312.7 million). However, it is projected that by 2015, Sub-Saharan Africa will have the largest number of poor people (366 million below \$US 1/day), and will be the region with the highest proportion of poor people (42.3%)” (Commission for Africa, 2005).

In 1981, SSA had approximately 150 million extremely poor. The majority of countries in SSA are classified as having extreme poverty; that is at least 25% of the households living on less than US\$ 1/day (Sachs, 2005). This chapter will delve into changes that could reverse this decline in quality of live on the subcontinent.

⁵⁰⁴ World Bank definitions include “Extreme Poor” living on less than US\$ 1/day measured at purchasing power parity and “Moderately Poor” living on US\$ 1-2/day (Sachs, 2005).

Since Africa is the least developed region of the world, it imports the bulk of its machinery and equipment used in local production, as well as a substantial portion of its consumer goods. Only 10% of Africa's exports are manufactured goods. Africa has actually experienced a de-industrialization; experiencing a decline in total manufacturing output and a decline or stagnation in the proportion of the labor force in manufacturing (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*) [see Chapter 12, Section 12.3.4.4, Trade and structural adjustment policies (SAP)].

In Africa's "industrial" sectors, only mining and petroleum production continued to grow over the past two decades. Part of the problem has been the Third World's, including Africa's compulsory economic liberalism in the 19th and 20th centuries. This is a major element in explaining the delay in industrialization, or in the case of India, de-industrialization in the 19th century, where Great Britain exported raw cotton from India for its industry, while shutting down India's textile industry through protectionist measures, as well as shipbuilding, steel, locomotives and other industries through "free-market" principles (Chomsky, 1999) (see Chapter 12, Section 12.1, COMMODITY DEPENDENT, AFRICAN GOVERNMENTS FALL IN-DEBT – SPIDER WEB OF THE WORLD BANK AND IMF).

As discussed, African economies are very small and based on the production and export of a handful of primary commodities with minimal industrial processing. This size and dependency is a result of colonial domination and a world economic order, which has severely constrained the growth opportunities for the "last and least" seeking to develop. As a result, Africa is extremely vulnerable to external forces beyond its control, such as when global prices for the raw products, which it has to export, are low compared to the manufactured products from the West and increasingly from the East, which it must import. It is estimated that about

25% of the purchasing power⁵⁰⁵ of Sub-Saharan Africa exports was lost over the 1980s due to the global recession of the early 1980s. This resulted in new lows for African commodity (raw products) prices, with continued declines in prices for coffee and cocoa (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*) [see Chapter 12, Section 12.2.5, ILO Demands an End to Subsidies and Trade Barriers and Section 12.3.4.4, Trade and structural adjustment policies (SAP)].

Servicing Africa's debt is estimated to absorb more than 20% of all export earnings each year, which is four times higher than annual expenditures for health and education (see Chapter 12, Section 12.5, DEBT AND STRUCTURAL ADJUSTMENT POLICIES and Section 12.6, IMPACTS OF STRUCTURAL ADJUSTMENT ON SOCIAL WELFARE AND EMPLOYMENT). This problem is compounded by the highest rate of population growth in the world, a large percentage of the population coming into the work force (see Chapter 5, Section 5.9, OVER-POPULATION, SOIL DEGRADATION AND DECLINING AGRICULTURAL PRODUCTIVITY), combined with the highest HIV/AIDS rate in the world, averaging 3%/year. HIV/AIDS in the long-term will counter the high birth rate, but could devastate the productive portion of the population, leaving mainly non-working, under-aged youth and the elderly behind to fend for themselves (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*) (see Chapter 5, Section 5.8, HIV/AIDS DECLINING AGRICULTURAL PRODUCTION AND FOOD SECURITY IN SSA).

⁵⁰⁵ Purchasing power of money is measured by the quantity and quality of products and services it can buy, also called buying power.

This continues to place increasing pressures on Sub-Saharan Africa's already over-used land and natural resource base by a predominantly rural subsistence population, while in the cities there is tremendous competition for the few available jobs, with little opportunity for upward mobility. Tropical soils are very fragile [see Chapter 5, Section 5.5.2, Physical and Environmental Constraints to Overcoming Food Production in Sub-Saharan Africa (SSA)] and the pressures of rapid population growth and intensive economic exploitation are causing widespread ecological damage, and contributing to the reduced agricultural yields. Arable land per person is declining, as discussed in Chapter 5 (Section 5.9.1, Overpopulation, Land Scarcity and Decreasing Agricultural Production in Sub-Saharan Africa). Fallow periods are no longer sufficient to restore soil fertility (see Chapter 5, Section 5.9.3, Fallow Agriculture, Over-Population and Agricultural Production) and the costs of increasing yields by external inputs of fertilizers and pesticides versus the increase in yields, are not cost-effective in much of Sub-Saharan Africa as there are often other limiting factors to production, such as chemical and physical qualities of the soils, climate, economies of scale, under-training in the latest technologies, poor market transport, storage and processing infrastructure (see Chapter 5, Section 5.12.1.8, Infrastructure technology as an incentive to increased agricultural production). Factors such as drought, locusts, quelea, rodents and other pests often make it too risky for most subsistence farmers to purchase inputs (e.g., pesticides and fertilizers) without large subsidies, which African countries cannot afford (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*) and which structural adjustment policies (SAPs) have discouraged (see Chapter 12, Section 12.4.3, Declining Fertilizer Use in Sub-Saharan Africa).

Meanwhile, forest areas are being invaded across the continent, first for timber and charcoal and then for cultivation and grazing, while the opportunity for the forests to regenerate is nil (see Chapter 5, Section 5.6.1.1, Impacts of colonialism

on agriculture and pastoralism in the Sahel, Section 5.9.4, Forest Losses Linked to Over-Population and Agricultural Land Scarcity and Chapter 11, Section 11.7.7.2, Mismanagement, corruption and classified forests, Senegal). At the same time, growing numbers of people and livestock are being forced into more and more marginal areas, increasing erosion and desertification (Stryker & Ndegwa, 1995 *In: Martin & O'Meara, 1995*) (see Chapter 6, Section 6.1.4.7, Impacts on pastoralism and range ecology from increases of human and livestock populations in the 20th century). Very often civil wars and conflict result from a collision between traditional pastoralists moving south and itinerant farmers moving both north and south (see Chapter 5, Section 5.11, CONFLICT LINKED TO OVERPOPULATION AND DESERTIFICATION).

Where is Sub-Saharan Africa going economically and how can this seemingly hopeless situation be overcome? Economies should be driven by the private sector, while governments should play a regulatory role and create an enabling environment in which the private sector can operate. Up until now, Sub-Saharan African governments have tried to take on the role of both the private sector and government, as “player and referee” in controlling economies (see Chapter 12, Section 12.3.4.2, Structural adjustment and privatization of parastatals), or have been in cahoots with the private sector in exploiting African natural resources to their advantage, but to the disadvantage of the rural poor living among these resources, be they mineral, wildlife, timber or other [see Chapter 11, Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the “Dobi Dobi”, More Parks and Protected Areas and Section 11.11.7, Case Study Bongo in the Congo (Brazzaville)].

The United Nations Draft Declaration on the Rights of Indigenous Peoples, presently under negotiation, will likely demand (see Chapter 11, Section 11.10.1, Foreign Aid for “Conservation”?):

“recognition of prior rights of indigenous peoples over lands and resources they have occupied and nurtured since time immemorial. The refusal or inability of indigenous peoples to take advantage of modern land titling processes, which do not recognize their indigenous land tenure systems and resource rights systems, should not be used as grounds for their dispossession in favor of other interests” (ILO, 2004).

However, as seen from case studies throughout this book, African governments currently declare ownership over both land and these natural resources and, in turn, use the multi-nationals and/or foreign companies to extract these resources and obtain added value on the international market, with little or none of the value going to rural people.

While a partnership with the international private sector is imperative, as will be described below, the private sector’s attitude towards Sub-Saharan Africa, in collusion with Western governments, was, and too often still is, short-term and exploitative with what appears to be explicit collaboration and backing by international donors and financial institutions. Perkins (2006) describes the inter-relationship between corporations, banks, governments and related multilateral financial institutions and bilateral donors as “corporatocracy”, in which a global empire is developing, run and controlled by multi-nationals. Since the first Arab and European slavers entered Africa, the relationship has been one of plunder, Africa’s rich resources being mined off the continent with little or no reinvestment in the infrastructure or the people. Like America, the best developed countries in Sub-Saharan Africa are or were those in southern Africa, where the white settlers came to stay and reinvested the wealth they generated back into the

infrastructure of the country, but (unfortunately) too often not back into its people, though this is changing.

13.2 INSECURITY AMONG THE PRIVATE SECTOR

Often the only way the private sector survives in Sub-Saharan Africa is through under-the-table payoffs to corrupt government officials linked to a system of patronage and clientelism, which is how many poorly paid bureaucrats with large extended families earn the majority of their salaries (see Chapter 11, Section 11.6.3, Neo-Patrimonial Clientelism, The Big Man and “Cosmetic Democracy”). With little security and an uncertain future, even the private sector in Africa tends to take a subsistence approach to business “living for today”. This is very disconcerting when one speaks of natural resources such as wildlife, forests and fishes; where because of the insecurity, there is a tendency to “mine” them as though they were non-renewable.

As one professional hunter said (Anon., *pers. comm.*),⁵⁰⁶ “In Africa’s safari industry you have to make your investment back in the first 3 years. Then you may get a few years of net profits and only God knows when it will end”. When the principal author first hunted in Tanzania, safari operator Franz Wengert (*pers. comm.*)⁵⁰⁷ sat him down and in exasperation explained, “I used to hunt, but today, I spend most of my time fighting the government trying to keep what I have”. Here was a man who for 22 years successfully ran and operated a safari hunting and ecotourism company. He started from scratch and built it into a company that generated US\$ 600,000/year for the Tanzanian government. He operated, managed and marketed up to 13 hunting blocks at a time, amounting to 2,000 km²/block at a minimum. He averaged 40-60 hunts per year or somewhere between 60-80

⁵⁰⁶ ANON (2001). Anonymous to protect the professional hunter.

⁵⁰⁷ Franz Wengert (1991). Former owner of Wengert-Windrose Safaris, Arusha, Tanzania. Now residing in the Dominican Republic. franzwengert@web.de.

clients/year. Yet, for a small payoff to a mid-level bureaucrat, the Tanzanian government was prepared to give away his hunting blocks. He was basically told to pay his fees on a national holiday, which was impossible, and this failure of timely payment used to confiscate two of his hunting blocks. The principal author prepared a document with Mr. Wengert (Wengert, 1998), which he used through the Lawyers Environmental Action Team (LEAT) (Majamba, 2001) to take the Tanzania Wildlife Division to court over this trumped up excuse on the timely payment of government fees as a basis to confiscate some of his blocks. He won the case, the High Court of Tanzania declaring the action by the Director of Wildlife a nullity due to a clear abuse of powers vested in the Director of wildlife by the law (Majamba, 2001). LEAT also helped safari operator George Alexiou (now deceased) to win a similar case, while safari operator Raoul Ramoni was also obliged to take the Wildlife Division to court, winning a case against the confiscation of one of his hunting blocks. It is said that the then Wildlife Director, Mr. Muhidin Ndolanga, retired as one of the richest men in the history of game management, globally.

Until the private sector has security in Sub-Saharan Africa, be it a local community, individual or multi-national corporation, there will be a tendency to “mine” the subcontinent’s resources. Much of the Western private sector will be reluctant to invest in the continent or, like carpet baggers after the American Civil war going into the impoverished South, will only come to milk the continent, with little reinvestment into its development. This is a good summary of the situation at the beginning of the 21st century on the African subcontinent, other than maybe South Africa.

13.3 CAPITALISM WITHOUT A CONSCIENCE

The U.S. Defense Science Board concluded in a

“1997 report ‘Historical data show a strong correlation between U.S. involvement in international situations and an increase in terrorist attacks against the United States’ ” (Phillips, 2004).

As the world enters the 21st century, the new religion appears to be materialism, regardless of the consequences to nature or fellow man.

“ ‘The Bank and IMF are instruments of a few rich governments, which hold a majority of the dollar-based votes, and would rather pretend that all is well than ask their tax payers to address the urgent problems of the poor...The IMF has no business trying to run dozens of poor countries...its policy recommendations have left Africa every bit as dependent on primary commodities as it was 29 years ago’ ” (Jeffery Sachs⁵⁰⁸ In: Legum, 2002).

Things are not okay and 911⁵⁰⁹ should have been a wake-up call to the citizens of the West. Given media bias, this is not evident.

“ ‘When the ruler of a country fails to apportion wealth to those in need, poverty becomes prevalent. Poverty being prevalent, theft becomes prevalent, weapons become prevalent. When weapons become prevalent killing and maiming become prevalent, lying becomes prevalent...slander...sexual infidelity...abuse and frivolity...covetousness and jealousy...wrong understanding becomes prevalent’ ” (The Buddha 545 BC In: Legum 2002).

⁵⁰⁸ Jeffery Sachs, Director of the Centre for International Development at Harvard, from a speech at the World Bank in April 2000 and a Financial Times article of September 26, 2000. By 2005, Director of the Earth Institute, Columbia University and Special Advisor to UN Secretary-General Kofi Annan on the Millennium Development Goals.

⁵⁰⁹ September 11, 2001, planes crashed into World Trade Center, believed linked to Muslim fundamentalist group, *al-Qaeda* headed by Osama Bin Laden.

At the beginning of the 21st century, this applies to much of the failed states on the African subcontinent who have helped improve Western prosperity at the expense of the African people through globalization, and even to South Africa as a legacy of Apartheid and the poverty and backwardness, it created.

As early as the 1960s, René Dumont (1966) saw the growing gap between the rich and the poor in the world as a “dangerous international threat” to “world peace”. This gap has increased significantly since the 1960s and can be clearly expressed by the growing difference in GDP’s between the 20 richest and poorest countries. In 1960-62 the per capita GDP in the 20 poorest countries was US\$ 212 versus 11,417 in the 20 richest countries as opposed to 2000-02 where the figures are respectively, US\$ 267 versus 32,339 (ILO, 2004). Bodansky (2001) states that

“with destitution and misery growing throughout the developing world, the Islamists ‘hearts and minds’ campaigns are proving extremely successful in building solid and resilient popular bases, encouraging local youth to join the jihadist forces – though the leaders of this Islamic radicalism tend to come from the affluent and privileged segment of society, are highly educated and relatively Westernized”.

Bond (2002) quotes from the New Partnership for Africa’s Development (NEPAD) that the continual marginalization of Africa from globalization and social exclusion for the majority of the people constitutes a serious threat to global stability, but believes this is rhetoric that does not match what is happening on the ground, the continual application of structural adjustment policies and thus, marginalization.

In the December 11, 2001, *Washington Post* an editorial by African American Susan Rice, former Under Secretary of State for African Affairs from 1997-2001 (Rice, 2001), explained:

“ ...Africa is an incubator for the foot soldiers of terrorism. Its poor, young disaffected, unhealthy and under-educated populations often have no stake in government or faith in the future. They harbor an easily exploitable discontent with the status quo. For such people in such places, nihilism,⁵¹⁰ is as natural a response to their circumstances as self-help.”...

It is interesting that this comes from what Madsen (1999) calls an architect of the African Crisis Response Initiative (ACRI), which appears to be a wedge into American hegemony in Africa (see Section 13.8.2, American Imperialism in Sub-Saharan Africa, a Struggle for Control of Francophone Africa), regardless of the cost to humanity on the continent. Is it possible she wishes to repent for past sins?

In a similar article in the South African *Farmers Weekly*, well-known conservationist and founder of Holistic Resource Management fame, Alan Savory, living in New Mexico, USA, who was also a top guerrilla warfare commander in the Southern Rhodesian (Zimbabwe) military for over 20 years and founded the “tracker unit” which became the famed elite Selous Scouts - wrote concerning 911 and the war on terrorism that:

“...The President has called it a war and pledged to win it. This pledge, while understandable because of prevailing emotions, is about as meaningful as the many pledges to win the war against drugs. America and the Western nations, whose way of life is under attack, will need far deeper understanding to bring about peace and to safeguard what we value in our way of life. This is not a new form of warfare – it is one of the oldest forms of welfare. And due to technological advances, it is capable of wreaking unbelievable havoc...I see in America a repeat of what I lived through. Our strength is our greatest weakness. What do I mean? In Rhodesia we had an extremely capable and efficient army for bush warfare. We never lost a single encounter or battle no matter

⁵¹⁰ Nihilism: Conditions in a society are so bad that destruction is desirable.

what the odds, but that guaranteed we would lose the war. I say this because these situations are not wars requiring military solutions but situations requiring civilian policies that deal with the root cause of the people's frustrations and suffering. When all of your attention and funding is focused on revenge, there is little room for looking deeper...American leaders would be wise not to treat this as a war but rather a serious wakeup call to look at an extremely broad and comprehensive strategy involving our foreign and domestic policies and our education and business systems...If America is to provide the leadership needed at this moment, we must try to understand how and why the bin Ladens of the world can have such a pool of angry young men who are prepared to give their lives" (Savory, 2001).

We need to:

- "Heed the cries of people displaced by massive dam construction in India and Africa, or the bulk of the Mexican population whose lives are daily becoming worse under the North American Free-Trade Agreement (NAFTA).
- Realize that we cannot prop up the despots to ensure access to oil while hundreds of thousands under these despots live lives of slow starvation (e.g., Nigeria, Angola, the Democratic Republic of Congo, Congo Brazzaville, etc.).
- Understand that we cannot call on people in poor countries to be good capitalists and then go to war against them for supplying us with drugs our citizens seek.
- Understand that when we ban chemicals that are known to be damaging to humans, we should not allow multinational corporations to increase their manufacture and sale in the Third World countries so that we can profit (e.g., banned pesticides).
- Recognize that we cannot take thousands of years of careful nurturing of genetic material by simple people and patent the genes for the profits of our corporations and their shareholders.

It is not democracy that is under attack but rather certain aspects of our lives that others see as causing their suffering. It is in our own enlightened self-interest to look at our policies and business activities and the effect these are having on the world's natural resources and communities....To win peace, the President's advisors should include men and women who understand the effects on millions of ordinary peace-loving people of our agriculture, trade and arms sales, and other policies as well as the effects of multinational corporations" (Savory, 2001).

“Poverty does not create terrorists – that’s a falsehood and a smear. However, theft of wealth and development denied inevitably seeds resentment, the spark terror’s masters know how to stroke. Corruption and stolen opportunity stalk the streets and hard corners where terrorists recruit. Globalization if properly applied can be a means of relieving mass endemic poverty and a key to defeating terrorism” (Bay, 2002).

“It might be expected that President Bush’s meeting today with Presidents Daniel Arap Moi of Kenya and Meles Zenawi of Ethiopia would be dominated by the war on terrorism. East Africa has been a center of activity for al-Qaeda for some time...Terrorist groups have taken root in the region in part because of the misrule inflicted on nearly 100 million people by these two presidents” (The Washington Post, 2002).

Legum (2002) best sums it up in two quotes:

1. A letter from past Russian Premier Mikhail Gorbachev to Past President George Bush Sr. (current President George W. Bush’s father) entitled: *“The World Doesn’t Want to be American:”*

“ ‘....It is time for the America’s electorate to be told the blunt truth: that the present situation...is not tenable as long as an enormous portion of the world live in abject poverty, degradation and backwardness...Instead of seeing an increase in U.S. security, the end of the Cold War has seen a decline. Should the United States persist in its policies, the international situation will continue to deteriorate’ ” (Legum, 2002)

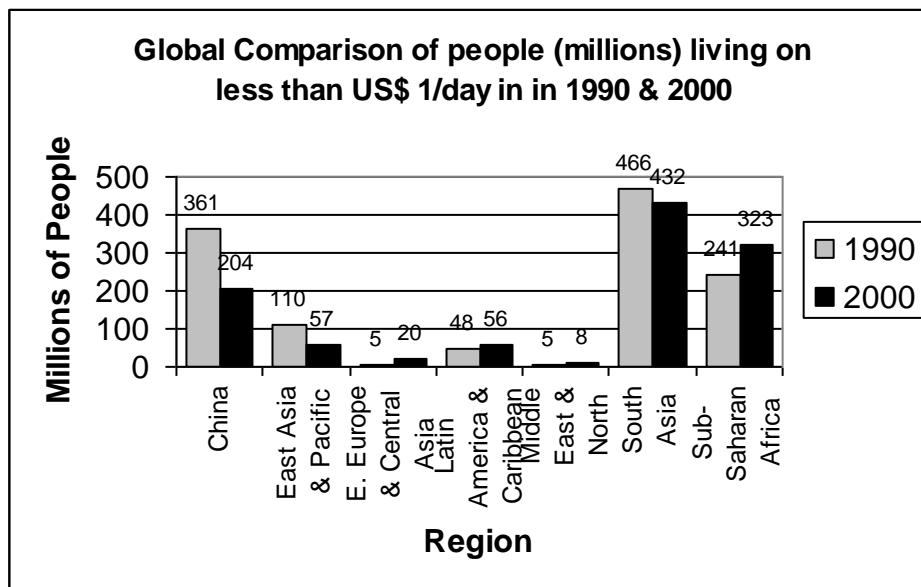

2. “ ‘...Either start caring about the fate of everyone on this planet or be prepared for a slippery slope towards violence that will eventually dominate our daily lives;’ ” (Rabbi Lerner In: Legum, 2002).

Like it or not, America’s global domination of the world economically, culturally, politically, militarily and technologically causes America to be seen globally as

the “world’s dominant minority”, resulting in backlashes no different than the Hutu against the Tutsi (Chua 2003) (see Chapter 11, Section 11.6.3, Neo-Patrimonial Clientelism, The Big Man and “Cosmetic Democracy”; Section 11.6.4, Dangers of Economically Repressed Majority Being Handed Political Power through One Man One Vote Elections and Chapter 13, Section 13.8.6, Former Cold War allies vying for power in the Great Lakes Region). The INTERNET and CNN, outcomes of globalization, fuel this growing discontent as the poor of the developing world become aware (Chua, 2003) of what they do not have, people often living in resource rich countries in which this wealth is squandered, often in collusion with Western governments and multi-nationals. This disproportionate distribution of wealth today has resulted in the richest 1% of the world’s population owning as much as the poorest 57%. Half the world’s population live on less than US\$ 2/day, and more than one billion (about 17% of the World’s population of 6.1-6.3 billion) on less than US\$ 1/day (Chua, 2003; World Economic Forum, 2004), unable to escape from the “poverty trap;” too poor to save for the future and thus unable to escape economic poverty and often consequential environmental degradation (depletion of natural capital) (Sachs, 2005), while the top 20% of those living in high income countries account for 86% of the world’s private consumption (Chua, 2003). While in 1820 the biggest gap in per capita income between the richest country, the United Kingdom (about US\$ 1,600 per capita GDP) and the poorest region, Africa (about US\$ 400 per capita GDP) was only 4/1 by 1998, this gap had increased to 20/1 between the richest country, the United States (about US\$ 26-27,000 per capita GDP) and Africa (US\$ 1,300 per capita GDP) (Sachs, 2005). As discussed in Chapter 5 (see Section 5.4, HUNGER LINKED TO POVERTY), half of Sub-Saharan Africa’s 600 million people live on less than US\$ 1/day (World Economic Forum, 2004) 46.4% in 2001 according to the Commission for Africa (2005), and roughly half lack access to clean water (World Economic Forum, 2004) (see Chapter 11, Section 11.13.2.4, Safe drinking water in Africa as a health indicator). Other than

South Asia, Sub-Saharan Africa's inhabitants may be considered among the poorest in the world (ILO, 2004) (Figure 13.1).

With a recent average economic growth of 3.3% a year in Africa, few countries will achieve the poverty reduction goal for 2015; the number of the poor projected to increase as populations rise (World Economic Forum, 2004).

Source: Redrawn with permission, Copyright © International Labor Organization (ILO) (2004).

Figure 13.1: Global comparison of people living on less than a US\$ 1/day in 1990 and 2000 (in millions)

Meanwhile in the 1990s, where terror lurked around the street corner, two billion people, particularly in Sub-Saharan Africa, the Middle East and the former Soviet Union, have not benefited from globalization, leading to greater inequality, often with a few elites within these countries taking advantage of economic opportunities stemming from globalization (Chua, 2003), at the expense of the majority who remain poor or become poorer and more frustrated, eventually de-linking themselves from any hope of civil society giving them an opportunity. This is mainly due to the extraction of raw resources with a minimal investment, exchange of technologies or stimulation of national and regional economies. In

fact, Sub-Saharan African is a region of under-investment by the international private sector World Economic Forum (2004) (see Chapter 11, Section 11.6.7, Foreign Aid and Puppet Governments – “Donor Democracy” and Section 13.13.5, Foreign Direct Investment in Sub-Saharan Africa).

These hopeless masses are the majority recruits, the “World-Hutus” used as pawns by a fanatical elite minority (Muslim fundamentalists practicing “Political Islam”), no different than the minority educated Hutu elite using the poor uneducated Hutu majority in Rwanda, against the “World-Tutsi”, the United States and the West in general (see Section 13.8.6, Former Cold War allies vying for power in the Great Lakes Region). The World Trade Center was seen as the “High Temple of Capitalism”, housing thousands of highly paid “soldiers” fighting an economic war that forces 80% of mankind to live in poverty. America should not ignore the widespread hatred felt against it as no empire can successfully oppress other nations and cultures indefinitely (Chua, 2003) in order to maintain their lifestyles. Sachs (2005) believes that with only 4.5% of the world’s population, the neoconservative push for unilateralism and the creation of a global U.S. empire is dangerous, as its economy cannot sustain such attempts. Additionally, Sachs (2005) concludes that America has found, as with Iraq and Afghanistan, that it can conquer, but it cannot rule, being seen not as a liberator, but as an occupier, as a result of the rise in the political ideology of nationalism and self-determination throughout the 20th century.

The danger for America is a loss of democracy and the security that Americans have known for the last 150 years. In other words, our accumulation of wealth and lifestyles at the expense of the rest of the world has triggered a backlash – terrorism. Rather than trying to understand “why they hate us”, Americans are turning blindly to the flag and this blind faith in “America the Beautiful”, allowing evil in society to take advantage of misled patriotism to continue living

off the backs of the rest of the world through imperialist aggressions justified on the premise that they are protecting America, when in reality they are controlling the world's resources for America's multi-nationals. Norman Mailer (2003) is concerned that a reaction to terrorism in the U.S. has been a

“ ‘blind promiscuous flag waving patriotism,’ without asking why this happening to us is? In a country with collapsing moral values dominated by materialism, this form of patriotism ‘becomes the hand-maiden of totalitarianism,’ where the freedoms of democracy are slowly eroded away. The ‘country becomes the religion.’ We are asked to live in a state of religious fervor: Love America! Love it because America has become a substitute for religion. But to love your country indiscriminately means that critical distinctions begin to go. And democracy depends upon these distinctions”.

This risks the creation of an endless cycle of violence that will be visiting America's backyards, a phenomenon that up until now America has been insulated against. As the Hutu and Tutsi elite used and misled the masses to their own ends, so are the elite in America misleading their citizens about the real issues that helped to spawn “911”.

“An Africa with failing states and deep resentment can become a source of conflict which is not only internal but spreads across continents in international terrorism and crime. Cells of groups linked to al-Qaeda are thought to be in operation in Kenya, Ethiopia, Somalia and Sudan and terrorist attacks have already taken place in East Africa (August 7, 1998 U.S. Embassy bombings in Kenya and Tanzania)...(in) Africa's population of around 700 to 800 million, there are roughly 350 million Muslims, 400 million Christians and some 100 million followers of indigenous religions” (Commission for Africa, 2005).

It appears the mastermind of the July 2005 London subway bombings may have used southern Africa as an operational base (WJLA, 2005). Geographically, the Muslim religion dominates in a large part of Africa (Figure 13.2). AKL (2005)

estimates that 250,000,000 or 20% of the World's Muslim population live in Sub-Saharan Africa. Though traditionally home to the moderate and more tolerant Islamic Sufi sect, poverty, corruption and political alienation are contributing to the spread of radical Islam in Sub-Saharan Africa, such as in Somalia, Eritrea and Kenya, while Nigeria, with 60 million Muslims, has already seen Islamic law

Figure 13.2: Muslim Africa, 1987

“*Shari'a/Shariah/Sharia*” adopted in the north, often contributing to religious tensions and violence. As a result of hopelessness among many of the youth, Sub-Saharan Africa is serving as the feeding grounds for committed extremists from outside the region to move through and gain local support and assistance, even though the local people may or may not be the ones who are providing most of the foot-soldiers for extremism and terrorism. Africa is on its way to becoming the first Muslim continent (AKL, 2005).

In addition to terrorism, America and Europe are experiencing a major and, one could argue, uncontrollable immigration as the Third World abandons its homeland for these promised lands. This is epitomized in 2005, by 11,000 Sub-Saharan African lumpens trying to scale the razor wire fences in the Spanish enclaves of Ceuta and Melilla on Morocco's Mediterranean coast in hopes of gaining access to the mainland and a new life (Ham, 2005). The Spanish Canary Islands, another gateway into Europe, are also a major destination for West Africans, of which at least 32,000 were prepared to die in 2006, departing the West coast of Africa in unseaworthy boats, rather than remain on a subcontinent that offers them nothing but hopelessness and despair. In Senegal, there are many villages with only women, elderly and children. They have not heard from their husbands, brothers, fathers and sons in months, not knowing if they survived or drowned in their bid to attain Europe (Schlein, 2007a) and a better life, where remittances back home can make a difference in the survival of the family. Women and children are beginning to chance this perilous voyage (Tran, 2007).

This is resulting in a large and growing “South” in the “North”. This is resulting in major urban centers in the West generating stratified dead-end and precarious lives lower on the social ladder. In 1998, a child born in New York City stands a smaller chance of living to five or learning to read than a child born in Shanghai. In Marseille, France, there are North African slums where few policemen dare

venture. If a child survives to adulthood under such conditions, he/she is a prime candidate for terrorism or criminality since he/she will not be trained to integrate into mainstream society (Sogge, 2002). The November 2005 outbreak of violence (burning vehicles and schools) by the North and Sub-Saharan immigrants living in the *bidonvilles* of France is indicative of things to come if Africa does not develop.

The World's economic system has a lot to do with how we relate to each other (Legum, 2002). Unless capitalism develops a "conscience", the West must wake up and realize that its very existence and lifestyle is in jeopardy, and cannot continue to exist on the shoulders of and at the expense of the Developing World. Slavery in the "Deep South", American segregation and South African Apartheid, in which a few benefited off the backs of others, were not sustainable. In this world of global communications, the awareness that the materialistically dominated lifestyles of the West depend on living on the backs of the rest of the world, will also be unsustainable. We are truly a global society and our futures are too intertwined to ignore the plight of the majority poor in the rest of the world.

13.4 EXPROPRIATION OF NATURAL RESOURCES, IMPLICATIONS FOR REGIONAL AND NATIONAL SECURITY

There is increasing concern about the adequacy of the natural resource base of states in Sub-Saharan Africa. Much of the relative economic development in Sub-Saharan Africa is attributable to the exploitation of non-renewable resources, such as fossil fuels and metallic ores, or to non-sustainable rates of exploitation of renewable resources, such as forestry, fisheries, related water systems and agriculture. The increased demand for resources for local, national and export markets, as well as escalating competition for the control of natural resources,

have been a source of insecurity in the southern African region. Adding to this is the prospect of the recolonization of Africa's resources as a result of economic liberalization (Structural Adjustment) since the 1980s. Examples of this include the concession of territorial enclaves rich in mineral, forest and biodiversity resources to direct control of multinational corporations and Western NGOs [see Chapter 11, Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the "Dobi Dobi", More Parks and Protected Areas and Section 11.11.7, Case Study Bongo in the Congo (Brazzaville)]. Recent research indicates that the lack of resources and environmental degradation are playing more prominent roles in factors contributing to destabilization on the continent. "Development", which adversely contributes to environmental change, may also cause instability (Van Wyk, 2000).

13.5 FAILURE TO DEVELOP GOOD GOVERNANCE IN MINERAL RICH COUNTRIES

"Lack of transparency encourages corruption, especially where politicians and officials are members of secret societies, which are common in Africa as in the rest of the world. This lack of openness is a particular problem where income – particularly that derived from oil, minerals and other high-value natural resources – is managed in a way which hides accounts from the public...All the evidence shows that oil, for example, usually enriches only the ruling elite. For the vast majority of the population mineral wealth often appears merely to increase corruption, poverty and political instability" (Commission for Africa, 2005).

Governments with large resource bases tend to be poor at developing state institutions, since revenues from mineral sales reduce the need to levy taxes and thus diminish the need for accountability to citizens. In turn, this revenue can be used to develop political patronage (see Chapter 11, Section 11.6.3, Neo-Patrimonial Clientelism, The Big Man and "Cosmetic Democracy"), maintain power and enrich the political elite and their families, resulting in poor economic

performance and greater socio-economic inequalities (LeBillon, 2000; Reno, 2000 both *In: Cilliers & Dietrich, 2000*). In contrast, where small producers grow coffee or cocoa, or even plantation economies that need a lot of workers to harvest sisal, tea or rubber, very few people are needed to gather oil. Most African states that currently experience major internal strife are dependent on oil or other enclave economy mineral exports for revenues. They include Algeria (with 98% of foreign exchange earnings from oil exports), Angola (83% from oil), Nigeria (96% from oil), Sierra Leone (96% from titanium ore and diamonds), and the Democratic Republic of Congo (78% from copper and cobalt). Developments in Liberia, Sierra Leone and the Democratic Republic of Congo show that strongmen can seize control over small, economically valuable pieces of territory and use them as bases from which to compete for control over what remains of the state and its rich resources (Reno, 2000 *In: Cilliers & Dietrich, 2000*).

“The question begs to be asked whether the different results of UN operations in Angola and Mozambique – one failed, one successful – were at least in part related to the fact that Mozambique is rich in prawns and peanuts, while Angola is rich in diamonds” and oil (de Beer & Gamba, 2000 *In: Cilliers & Dietrich, 2000*).

Countries with a high proportion of their Gross Domestic Product (GDP) consisting of mineral exports are more likely to face conflict, resulting in less democracy, poor economic growth and greed by competing elites. Perverse economic and institutional effects of resource abundance include (LeBillon, 2000 *In: Cilliers & Dietrich, 2000*):

- Poor economic growth;
- Neglect of non-resource sectors and a low level of economic linkages;
- High level of inequalities;
- Corruption of state institutions;
- High economic inefficiency and subsidization of politicized schemes;

- Budgetary mismanagement;
- High level of debt due to over optimistic revenue forecast and use of future revenues as collateral for loans; and
- High vulnerability to external shock, especially on resource prices.

Such regimes divested of a need for popular legitimacy, finance repressive security apparatuses, and reward a close circle of supporters and/or the general population through patronage/clientelism as a means of remaining in power. Lightly or non-taxed populations tend to be less concerned by the state's lack of accountability, legitimacy and "representativeness" than heavily taxed ones. Such populations live in parallel, non-formal economies not recognized by the State or the International Finance Institutions (IFIs). When resources guarantee sufficient rent, there is little incentive for the leadership to develop a diversified economy that could give rise to alternative sources of economic power and political competitors. The resource rent can be used to avoid the emergence of a class demanding political change (e.g., by impeding the growth of a middleclass independent from the resource rent) (LeBillon, 2000 *In: Cilliers & Dietrich, 2000*).

On the other hand, resource scarcity and population pressure can result in socio-economic innovation, including a diversification of the economy, resulting in a more even distribution of power across society. A resource poor country needs to develop and harness human capital rather than protect the weak resource rents of elites. As human capital develops (e.g., through education and institutions), the economy diversifies, governance becomes more representative and accountable and the likelihood of violent conflict decreases. Resource scarcity can also result in conflict, such as land scarcity in over-populated Rwanda and drought (water scarcity) in the Horn of Africa resulting in eco-violence or green wars (LeBillon, 2000 *In: Cilliers & Dietrich, 2000*) in Darfur, northern Nigeria and, in general,

across the Sahel (see Chapter 5, Section 5.11, CONFLICT LINKED TO OVERPOPULATION AND DESERTIFICATION).

Thus, in many African countries rich in natural resources, it may not be in the interest of the political elite, multi-nationals or their Western donors to have an educated middleclass that might demand accountability from its leaders as to what they do with the wealth generated by the country's natural resources with regard to developing the country and its human resources (see Section 13.10, RESOURCE WARS).

13.6 ENVIRONMENTAL STRESS AND POTENTIAL CONFLICTS

A recent study by OXFAM and arms control groups estimate that over a 15 year period from 1990 and 2005, conflict in 23 African nations (see Chapter 5, Table 5.24: Sub-Saharan African countries facing food emergencies at the beginning of the 21st century) cost these countries US\$ 300 billion (€214 billion) or about US\$ 18 billion/year, roughly equivalent in international aid from donors (see Chapter 11, Section 11.7.1.2, ODA) (AP, 2007; Bobb, 2007). The net result has been a 15%/year decline in GDP in these countries, the majority in Sub-Saharan Africa, resulting in 50% more infant deaths, 15% more malnourished people, a 20% reduction in adult literacy, and life expectancy declining by five years (Bobb, 2007). There are several links between resources, security and development in Africa, each with varying impact on destabilization on the continent (Van Wyk, 2000):

- **Conflict from Rich Resources.** Resources have been and still are used for military and political goals in Africa. Resources are often the defining factor in the power and wealth of a state. However, a number of variables determine the use of resources for a military or political goal, including the degree of resource scarcity, the extent to which the resource supply is

shared by two or more groups, the relative power of these groups and the ease of access to alternative resources. To become rich by controlling resources in war in Africa is a common practice. Rebels, governments and even peacekeepers have fought for diamonds, minerals and timber in recent wars in Liberia and Sierra Leone. In Sierra Leone, one of the recent peace agreements was only reached after the rebel leader, Foday Sankoh, was given a say in the country's mining industry. In Angola, the once ideological war made way for a scramble for oil (by the government) and for diamonds by the rebels. Rebels were offered permission to operate diamond mines legally.

- **Conflict from Scarce Resources.** As resources become scarcer, tensions will rise. Due to population growth, access to resources will not necessarily improve. The lack of resources also contributes to health issues. The UN Economic Commission for Africa (ECA) estimated that 80% of all diseases are caused by polluted water. Scarce resources have been used as an instrument or tool of conflict in Sudan where foreign food aid helps fuel the war (see Chapter 5, Section 5.11.4, Darfur, Sudan, overpopulation, desertification, ethnicity, conflict and politics and Chapter 11, Section 11.8.6, Food Aid and NGOs in Sudan). Genocide in Rwanda is partly a resource war between Hutus and Tutsis (see Chapter 5, Section 5.9.4.6, Deforestation in afromontane forests - Rwanda, over-population and land degradation linked to deforestation for agriculture and political destabilization and Section 13.8.6.7, Ultimate and proximate causes of Rwanda genocide) and has generated refugees which had an impact on the politics and security of neighboring states. War looms around the corner in much of Sub-Saharan Africa from scarce water resources (see Section 13.11, AFRICA'S POTENTIAL WATER WARS). Conflict over land and other resources is a continuous issue in Kenya, contributing to major ethnic conflicts in 2008 (see Chapter 5, Section 5.7.1.3, Improperly

planned land tenure; impacts on wildlife, conflicts between pastoralists and small-scale farmers, Amboseli and Maasai Mara).

- Resource installations, such as dams on rivers, have been used as targets of violence, conflict and/or war (see Chapter 7, Section 7.10.3, Dam Impacts on Ethnic and Other Conflicts and Section 7.10.3.1, Senegal River and Section 7.10.3.2, Cahora Bassa Dam, Mozambique). South Africa's intervention in Lesotho in September 1998 was to defend, among others, the Katse Dam, part of the Lesotho Highlands Water Project, from a possible attempted bombardment by the Lesotho Defense Force [see Chapter 7, Section 7.6.1, Lesotho Highlands Water Project (LHWP) and Chapter 12, Section 12.8.1, South Africa/Lesotho and Chapter 13, Section 13.11.2, Lesotho Highlands].
- Inequalities in resource distribution, use, management and development can result nationally and/or internationally in conflict as in Sierra Leone (see Section 13.10.2.1, Sierra Leone, war and diamonds).

Against this background, six key issues are identified in the emerging patterns of instability, due to resources in southern Africa (Van Wyk, 2000), that also apply to much of Sub-Saharan Africa:

- Secure supplies of water/energy in terms of quantity, quality, regularity and pricing;
- Competing or conflicting claims to and uses of resources at interstate or transborder community level;
- Transborder ecological effects of resource management caused mainly by intrastate practices leading to various effects;
- The militarization and regimentation of environmental management in relation to the illegal and armed acquisition of natural resources across national borders;

- New forms of land alienation through joint and cross border management of natural resources to achieve economies of scale (such as the Kgalagadi Transfrontier Park), the development of regional products such as tourism packages and spatial development schemes, such as the Maputo Corridor (see Chapter 11, Section 11.11.5, Trans-Frontier Conservation Areas (TFCAs), Southern Africa); and
- External global hegemony and control over resources and their use through the private cross border investment by multinational corporations that are supported by regional governments through global governance treaties (such as the Convention on International Trade in Endangered Species (CITES), Chapter 10), trade and aid conditionalities (see Chapter 11, Section 11.7.2, Foreign Assistance Conditionalities Good Business for Donor County Not Recipient/Host Country and Chapter 12, Section 12.3.3, Structural Adjustment and Cross Conditionalities and Section 12.3.4, Structural Adjustment, U.S. Movement to Control Developing Economies).

Trade generates economic benefits because, given free and efficient markets, it encourages trading partners to specialize in goods or services that they have some comparative advantage in. Since developing countries often have abundant natural resources and cheap, plentiful labor, trade liberalization has fostered shifts toward labor and resource intensive sectors such as mining, logging, garment manufacturing and export crop production. Most of these sectors generate environmental costs not reflected in the production costs of individual enterprises, be they farm, households or multinational companies. Social (and environmental) costs of production are excessive production, resource consumption and waste emissions (Wood, 2001 *In: Diaz-Bonilla & Robinson, 2001*).

Based on studies of developed countries, although natural resource consumption and degradation increases as economies grow, an income threshold (middleclass)

is attained, above which demand for a better environment stimulates investment in environmental protection and rehabilitation. Degradation is thus reduced. Many developing countries are so poor, population growth so high and natural resources already so stressed, that catastrophic, perhaps irreversible, environmental damage may well occur long before any such threshold is reached (Wood, 2001 *In: Diaz-Bonilla & Robinson, 2001*).

Since environmental policies and institutions are likely to be weak in developing countries, producers there (be they domestic or foreign) have little incentive to care about the environmental externalities of their actions. Examples include:

- Rampant logging of the world's biologically diverse and carbon-rich tropical forests [see Chapter 11, Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the "Dobi Dobi", More Parks and Protected Areas and Section 11.11.7, Case Study Bongo in the Congo (Brazzaville)];
- Trophy hunting with little or no monitoring to assure economic and ecological sustainability (see Chapter 9, Section 9.7.7, Inappropriate or No Wildlife Monitoring to Assure Sustainability) or true integration of local indigenous peoples into the management of and benefiting from these areas (see Chapter 9, Section 9.7.2.1, Devolution through policy reform, land and resource tenure). The lack of monitoring to assure sustainability is a general problem in SSA, where most natural resources are often handled as short-term commodities. Why should this not be when the donors and IFIs are waiting around the corner to artificially prop up governments, while the private sector lives in an environment of insecurity; incentives to both the government (foreign aid) and the private sector (insecurity) to mine the resources for short-term gains as opposed to using Africa's natural resources for nation building. Until there is a critical mass of educated people from the rural communities willing to stand up

for their rights, this imbalance will continue along with the mining of these natural resources;

- Inappropriate coastal development which destroys coral reefs, mangroves and grass beds (see Chapter 8);
- Inappropriately placed dams (see Chapter 7);
- Oil pollution of the land, air and water in the Niger Delta of Nigeria from unregulated oil exploitation (see Section 13.10.1.3, Oil and Repression in the Niger Delta – Nigeria); and
- Poor worker safety, unregulated air pollution both in and outside of the workplace, pollution of surface waters, slave labor, and slums like Mathare and Kibera around Nairobi and the Athi River, Kenya (UNDP, 2005).

Magome and Fabricius (2004 *In:* Fabricius, Kock, Magome & Turner, 2004) suggest that the Convention on Biological Diversity (CBD), which, among other things, encourages sustainable use of biodiversity resources, while both sharing benefits with indigenous peoples and respecting their traditional knowledge and management systems (see Chapter 9, Section 9.3, COMMUNITY BASED NATURAL RESOURCES MANAGEMENT (CBNRM) PROGRAMS – PART OF THE WAY FORWARD), is in conflict with the World Trade Organization (WTO). The WTO promotes privatization of biodiversity resources, knowledge and technologies, possibly to the detriment of nation states and local people (Kennedy, 1998 *In:* Magome & Fabricius, 2004 *In:* Fabricius, *et al.*, 2004). This is

“all for short-term gains by foreign investors, who can make their money and leave when the resource base runs out, and or the environment is too damaged to allow it to continue generating income. This raises concerns that globalization might create ‘pollution havens’ in developing countries, where foreign investors operate to escape stricter environmental laws and enforcement in their own countries. There are also fears that governments might

progressively push environmental standards lower as they compete to attract scarce foreign investment (the 'race to the bottom' hypothesis). These concerns are real and must be dealt with.

Some governments' adoption of lenient environmental standards raises concerns that these countries are, in effect, subsidizing exports and reducing the competitiveness of producers in countries with stricter standards. Attempts to raise environmental standards bring protests from domestic producers who are concerned about potentially higher production costs and loss of international competitiveness. Politicians express concern too about increasing domestic prices in the face of widespread poverty. Furthermore, developing countries maintain that differences in resource endowment, pollution assimilation capacities, and social preferences with regard to environmental standards are legitimate sources of their comparative advantage.

There is thus a growing sentiment that formal linkages should be strengthened between the World Trade Organization (WTO) process and global environmental regulation. But obstacles remain, such as resentment toward rich countries seeking to impose standards that are at odds with economic conditions and social preferences in poor countries. Moves to strengthen environmental regulation as a pre-condition for trade are perceived largely as a guise by which rich countries legitimize non-tariff trade barriers" (Wood, 2001 *In: Diaz-Bonilla & Robinson, 2001*).

Likewise, the ILO (2004) is concerned

"that incentive competition between developing countries to attract FDI is inducing these countries to go too far in lowering regulations, taxes, environmental protection and labor standards".

Bond (2002) raises similar concerns over the need to bring environmental externalities, such as pollution, into the market place through taxes or the trading of pollution rights, assuring that these costs are adequately accounted for as a part of doing business. The question that remains is whether the WTO is an impartial mediator or an arm of the West, which will be used to control and manipulate the Developing World. The jury is still out.

In the early 1990s, one had to only drive by the industries along the Athi River, Kenya, to smell the polluted air and see the polluted river, while “slave labor” lived in a cesspool of their excrement in some of the worst slums the world has ever seen. Profits were maximized at the cost of the environment and the people. As will be discussed below, pollution of the Niger Delta by oil companies continues in the 21st century. The private sector in the safari and ecotourism industries in most of Africa are foreign carpetbaggers “in bed” with governments, both of whom make the majority of the profits while great inequity exists in what they are willing to pay communities and individuals that are ignorant of the true value of their natural resources (see Chapter 9, Section 9.7.6.5, Until safari and tourism companies are community-owned and operated, majority of net profits will go to other stakeholders). This is also true concerning timber [see Chapter 11, Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the “Dobi Dobi”, More Parks and Protected Areas and Section 11.11.7, Case Study Bongo In The Congo (Brazzaville)], minerals and fisheries (see Chapter 4, IMPERIALISM, INDEPENDENCE AND FRESHWATER FISHERIES).

Legum (2002) makes it very clear that a major problem with large, rich corporations is that they have a feeble record with regard to pollution and conservation since the bottom line of their shareholders is to maximize profits in a very competitive global market. Thus, unless civil society requires environmental mitigation through laws, the risk is that environmental issues will not be addressed. The current problem is that the majority of Africans are too uneducated to realize these issues.

Africa must make sure that both the African Growth and Opportunity Act (AGOA) and the New Partnership for Africa’s Development (NEPAD) do not run

into this problem. Ideally, African countries would adopt similar environmental laws, which all investors would be required to follow as a means of putting each country on an equal footing in its competition for investment, while assuring protection of the environment from this investment. There is some concern that the Multilateral Agreement on Investment (MAI), if enacted through the WTO or similar international body, would take away the right of countries to impose such environmental controls on international investors, including the right of the investor to sue a government for such impositions (Legum, 2002).

13.7 GLOBALIZATION AND MULTI-NATIONALS – CORPORATE CAPITALISM

While containing 5% of the world's population (Ruppert, 2004)

“the United States alone consumes approximately 30% of all raw materials used by the human population in any given year” (Klare, 2001),

and 25% of the world's energy (Ruppert, 2004). Discounting the growing demand by Third World populations for resources, the current rate of First World consumption of resources is not sustainable (Diamond, 2005).

“Our first problem is not immigration but the American corporation. That is the force which has succeeded in taking America away from us...The people who feel this lack of balance probably make up 67% (2/3rds) of the country, but they don't want to think about it. We don't control our country. Corporate power is running this country now. The notion that we have an active democracy that controls our fate is not true” (Mailer, 2003)

Some 65,000 Multi-National Enterprises (MNEs), with around 850,000 foreign affiliates, are the key actors behind global production systems (ILO, 2004). A 1995 study by the Institute for Policy Studies (IS) provides us with the

information that, of the top 100 economies in the world, 51 are corporations (Copeland, 2000; Legum, 2002) and only 49 are countries (Madeley, 2002):

- Six Transnational Corporations (TNCs) or multi-nationals control 85% of the world trade in grains;
- Eight TNCs control 55-66 % of the global trade in coffee;
- Seven TNCs control 90% of global trade in tea;
- Three TNCs control 83% of world trade in cocoa; and
- Three TNCs control 80% of world trade in bananas.

Cargill alone controls 80% of the global grain distribution. Three agri-businesses (Syngenta, Dupont and Monsanto) account for 67% (2/3rds) of the pesticides, about 25% (1/4) of the global seed market and 100% of the transgenic (genetic material – DNA from another species and/or organism) seed market (Table 13.1) (Madeley, 2002). A problem that arises is that the World Trade Organization (WTO) negotiates trade between countries, but has no regulatory authority over TNCs (Madeley, 2002), which by monopolizing the world market for both agricultural inputs and outputs, can control prices to their benefit as the middlemen between the farmer and consumer.

The top 200 corporations combined sales are bigger than the combined economies of all countries minus the biggest nine; that is they surpass the combined economies of 182 countries (Copeland, 2000; Legum, 2002). About 500 companies control 67% (2/3rds) of the world trade and 50% (half) of all the productive assets (Legum, 2002).

Table 13.1: Corporate control of global commodity trade, 1983

Commodity	World Exports (US\$ million)	% Marketed By 3-6 Largest Transnationals*
<u>Food</u>		
Wheat	17,851	85-90
Sugar	10,636	60
Corn (Maize)	9,833	85-90
Coffee	9,636	85-90
Rice	3,613	70
Cocoa Beans	2051	85
Tea	1,844	80
Bananas	1,324	70-75
Pineapples (fresh)	74	90
<u>Agricultural raw materials</u>		
Forest products	47,255	90
Cotton	6,567	85-90
Tobacco	4,239	85-90
Hides and skins	4,047	25
Natural Rubber	3,321	70-75
Jute	135	85-90
<u>Ores, minerals and metals</u>		
Mineral fuels	382,685	75
Copper	8,287	80-85
Iron ore	6,231	90-95
Tin	2,230	75-80
Phosphates	1,588	50-60
Bauxite	833	80-85

*In a few cases up to 15 transnational traders account for the bulk of the market.
 Source: Copeland (2000) with permission, Copeland.

"IS⁵¹¹ goes on to point out that the 12th largest corporation, Wal-Mart, had annual sales greater in value than the GDPs of 161 countries. Looking at how this economic power translates into real terms, we see from the following table that the vast majority of the world's trade in commodities is accounted for by a handful of Transnational Corporations (TNCs)" (Copeland, 2000) (Table 13.1).

This trend (to concentrate corporate power) ridicules the theoretical argument of a purely free-market economy. Governments still make a policy on the foundations of competitive general equilibrium theory - whose many bizarre assumptions include that there is an infinite number of small companies and that none has power over the market (Legum, 2002). These technology-based multi-nationals or Transnational Corporations (TNCs) as they may be called, tend to buy out or put out of business labor-intensive rivals. While these top 200 TNCs employ 18.8 million workers, it is only 0.75% of the world's work force. Between 1993 and 1995, while the global turnover of the top 100 TNCs increased by 25%, they cut their workforce by 4% (Legum, 2002).

Growth of global production systems has been the most pronounced in the high-tech industries (electronics, semi-conductors, etc.) and in labor intensive consumer goods (textiles, garments and footwear).

"It is also becoming significant in the service sector where technological advances have made it possible for services such as software development, financial services and call centers (e.g., India) to be supplied from different countries around the globe. The high-tech industries have experienced the fastest growth and now constitute the largest single component of the manufactured exports of developing countries. In these industries, the production of parts and components is carried out by subsidiaries of MNEs (Multi-National Enterprises) located in developing countries" (ILO, 2004).

⁵¹¹ Institute for Policy Studies (IPS), Washington D.C., www.ips-dc.org.

Until now, globalization has been the result of powerful governments in cahoots with multi-national corporations, especially the United States, pushing trade deals in which the neoliberal/corporate hold over the world's "economy, polity, journalism and culture" is overwhelming. In fact, the principle architects of the neoliberal "Washington Consensus", providing unregulated access to markets of the developing world, are huge corporations (Chomsky, 1999). Noam Chomsky (1999) feels that democracy is under attack worldwide, including in the leading industrial countries, where powerful corporate entities are increasingly interlinked and reliant on powerful states and largely unaccountable to the public. Functioning democracy presupposes relative equality in access to resources – material, informational and other. In state capitalist democracies, while the public arena has been enriched by long and bitter struggles, private power has labored to restrict democracy by transferring decision making from the public to the unaccountable arena. Noam Chomsky feels that the "Corporatization of America" during the past century has been an attack on democracy, with "free-trade" agreements transferring decisions over people's lives and aspirations into the hands of "private tyrannies" operating in secret without public supervision. It is what the Financial Times calls a "*defacto* world government" that operates in secret and without accountability (Chomsky, 1999).

While the above issues need to be addressed, globalization is a fact of life. Global problems require global approaches and institutions. Protectionism, isolationism and unilateralism in the extreme, will not solve them (Messer & Cohen, 2001 *In: Diaz-Bonilla & Robinson, 2001*).

13.7.1 Western Multi-Nationals, Globalization and American Jobs

In the era of globalization, American jobs are expendable, the bottom line being profits to multi-nationals as they move overseas to maximize profits from low

wages and lax environmental controls. Perkins (2006) equates the sweatshops and lack of environmental controls, typical of many multi-national interventions in the developing world, as a “type of slavery reminiscent of medieval manors and southern plantations”. A vast majority of the U.S. trade deficit is due to extremely unbalanced trading relationships with a few key regions/countries, including Asia (75% of deficit in manufactured goods), the North American Free-Trade Agreement (NAFTA) between U.S., Canada and Mexico: (13%) and the European Union (EU) (13%) in a limited number of critical industries (e.g., aircraft, steel and agriculture with the EU). The United States had a combined trade deficit with Japan, China and Germany of US\$ 144 billion in 1998, amounting to about 67% of the total deficit in goods traded valued at US\$ 229 billion. With low labor wages, China has lured multinationals and their associated technology, rapidly moving from fabrication of “low-tech products such as shoes and apparel into higher-technology products such as aircraft and parts, computers, motor vehicles and telecommunications” (Scott, 1999). About 55% of the U.S. trade deficit is with developing countries.

“The dependence of the U.S. on commodity exports and the steady erosion of output and employment in high-wage, high technologies industries are stark indicators of the failure of U.S. trade and industrial policies to nurture and sustain U.S. international competitiveness” (Scott, 1999). Meanwhile,

“U.S. multinational businesses have prospered. The soaring prices of U.S. stocks reflect the renewed worldwide dominance of U.S. companies...U.S. corporations have continued to play a dominant role in world production and trade by aggressively investing and moving production abroad. Multi-nationals use plants in other countries to serve foreign markets and, increasingly, to service the U.S. market as well. For example, Mexico now exports more cars to the U.S. than the U.S. exports to the rest of the world. And Mexico's largest exporter is Daimler-Chrysler” (Scott, 1999).

Because of an increasing global trade deficit, the U.S. lost 2.4 million manufacturing jobs between 1979 and 1994. Between March 1998 and July 1999, they lost another 500,000 jobs and by mid-1999, they were expected to lose another 400-500,000 manufacturing jobs, mainly among non-college educated workers that make up 75% of the U.S. labor force. Trade inequalities in the U.S. have been responsible for 20-25% of the increase in income inequality in the U.S. over the past two decades, eliminating high-wage, high skilled manufacturing jobs in the U.S., while pushing workers into other sectors where wages are lower, such as restaurants and health service industries (Scott, 1999) (see Chapter 12, Section 12.2.4.4, Cotton subsidies and protected markets, Trade Agreements Hurt U.S. Textiles and Section 13.13.4, NAFTA, Maquiladora and the Environment, Lessons for Sub-Saharan Africa).

13.7.2 Western Foreign Policy and Multi-Nationals Exploiting Africa

“All peoples have the right to their country’s natural resources and wealth without foreign domination”. (African Charter on Human and Peoples’ Rights, Article No. 21 *In: Gary & Karl, 2003*).

“Over the past two decades, oil-importing countries have enjoyed the benefits of double insurance against oil shocks: considerable spare production capacity in Organization of the Petroleum Exporting Countries (OPEC),⁵¹² and sizable emergency stocks held by OECD countries. However, spare capacity is now reduced to historically low levels and there are significant risks that the oil market will continue to be tight going forward” (IMF, 2005).

U.S. oil production peaked around 1970 at about 10 million barrels/day (mbd), declining ever since, to about 5 million barrels/day in 2005 (GAO, 2007). In 2005, the U.S. imported 59% of the more than 20 million barrels/day (mbd) of oil it consumed, with imports expected to account for 60% of consumption by 2025

⁵¹² OPEC Members include Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Quatar, Saudia Arabia, United Arab Emirates and Venezuela (Solcomhouse, 2005; Wikipedia, 2005).

(Blum, 2005). The GAO (2007) estimates that the U.S. imported 66% of its oil and petroleum products in 2005, with transportation accounting for 65% of U.S. oil consumption. U.S. proven oil reserves have declined from 39.0 billion barrels in 1970 to 22.7 billion barrels at the end of 2002, less than 2% of the world's known oil reserves. U.S. petroleum production is expected to decrease from 9.2 mbd in 2002 to 8.6 mbd by 2025, while oil consumption will rise from 19.6 mbd in 2002 to 28.3 mbd in 2025, a 44% increase. The difference will have to be imported. Four major producers provided over nearly 70% of the U.S. imported oil in 2002: 1) Canada, 2) Mexico and 3) Venezuela combined supplying 45% and 4) the Persian Gulf region nearly 20% of the U.S. imported oil (Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia and the United Arab Emirates). OPEC country production is expected to account for 61% of the increase in petroleum demand over the next two decades (U.S. Department of Energy, 2005). The majority of the OPEC countries lie in politically unstable regions of the World. Thus, the United States is increasingly dependent on foreign oil making its economy highly vulnerable to disruptions. The U.S. strategic petroleum reserve has decreased from 118 days in 1985 to 53 days incase of a disruption (U.S. Department of Energy, 2005).

"Cheap oil fuels America's economy" (U.S. Department of Energy, 2005). Given the current situation in the Middle East and growing concerns over the long-term availability of oil, access to cheap oil is becoming a preoccupation with the West (Flakus, 2004). There is also a growing need for America to reduce its dependence on Middle East oil (U.S. Department of Energy, 2005). According to Paul Roberts, author of the book, *The End of Oil: On the Edge of a Perilous New World*, most of the easily obtainable, cheap oil has already been discovered and it will become more and more difficult to meet world demand (Flakus, 2004).

Global oil discoveries peaked in the mid-1960s. New fields tend to be smaller and in less accessible environments (e.g., deep sea and polar regions) (Ruppert, 2004). A peak in worldwide oil production could come within the next few decades (IMF, 2005), while the IEA (International Energy Agency) estimates non-OPEC oil production to peak around 2010 (GAO, 2007). At the same time, demand for energy is increasing, driven by emerging nations like China and India (IMF, 2005). The GAO (2007) expects global oil production will peak between now and 2040. The estimates of exactly when this peak will occur range widely due to variables such as the amount and how quickly oil remaining in the ground is used; how much of that oil can ultimately be produced given technological, cost, and environmental challenges; unfavorable political and investment conditions where 60% of the world's oil reserves are located; and future global demand.

Advanced countries will account for 25% of the increase in world oil demand, with most of the demand growth coming from developing countries. Transport demand in the non-OECD region will almost triple from 16 million barrels/day (mbd) to 45 mbd between 2003 and 2030, driven by a six-fold increase in vehicle ownership (IMF, 2005). It is estimated that 50% of all oil produced is used for transport (Ruppert, 2004).

This will make the world ever more dependent on politically unstable nations that have plenty of oil. Others like H. Sterling Burnett of the U.S. -based National Center for Policy Analysis⁵¹³ do not entirely agree, saying that there are three trillion barrels of oil reserves which could last 56 years under current consumption rates, with a 1.4% annual growth even if no more oil was discovered or new technologies developed to extract more from existing reserves. If new

⁵¹³ National Center for Policy Analysis, Headquarters: 12770 Coit Rd., Suite 800, Dallas, TX 75251-1339, Phone: 972/386-6272, Fax: 972/386-0924, Washington Office: 601 Pennsylvania Avenue NW, Suite 900 South Building Washington, DC 20004 Phone: 202/220-3082, Fax: 202/220-3096, <http://www.ncpa.org/contact.html>.

technologies can be developed, there are seven trillion (GAO, 2007) to 14 trillion barrels (Flakus, 2004) of oil in shale oil and tar sands that could suffice for 500 years, although this would imply higher costs of extraction and thus, higher costs to the consumers. Everyone agrees that alternative energies need investigating (Flakus, 2004).

Other estimates are that proven (conventional) oil reserves are sufficient to meet world demand at current levels for over 40 years. However, assuming access to other (non-conventional) sources such as shale, coal and deep-water, the International Energy Agency estimates oil resources could cover 70 years of average annual consumption (IMF, 2005), but once again at a much greater cost. Similarly, Klare (2001) estimates that at a global consumption of 73 million barrel/day in 1999⁵¹⁴ or 26.6 billion barrels/year, the residual oil supply of 1,600 billion (1.6 trillion) barrels could last 60 years, assuming static oil consumption. Assuming a rise in oil consumption by 1.9%/year between 1997 and 2020, total depletion could occur by 2040 (within 40 years) (Klare, 2001). Whether it occurs in 40 years or 70 years, oil is running out or, if nothing else, running low and becoming significantly more expensive as global demand increases. Estimates for years to exhaust proven reserves at current production rates for key oil producing countries include (WRI, 2005):

- Iraq, over 100 years
- Iran, Saudi Arabia, Libya, Venezuela and Kazakhstan, 43-100 years each
- Nigeria, Gabon, DRC, Angola, Russia, Australia, Canada, Brazil, Ecuador and Peru, 21-42 years each
- Canada, India, China, 13-20 years each
- USA, Argentina, Columbia, 6-12 years

⁵¹⁴ In 2000 the U.S. consumed 19.5 million barrels/day (25% of total global consumption) out of a total of 77.1 million barrels/day, projected to rise to 21.2 million barrels/day (25% of total global consumption) out of 84.8 million barrels/day by 2005, to as high as 24.7 million barrels/day (22% of total global consumption) out of 110.1 million barrels/day by 2020 (Klare, 2001).

Prices will remain volatile and there is no “silver bullet” with regard to alternative energy. The world will have to improve on the technology and efficiencies of a number of energy sources from wind, solar, hydro, nuclear, hydrogen, biomass/biofuels and fossil (oil, natural gas and coal) (Parfit, 2005).

The increasing use of biofuels using grains, soybeans, etc. risks to result in a declining availability of food to feed the world and should be a wakeup call to Sub-Saharan Africa to improving food security and increased food self-sufficiency (von Braun, 2005; Conway, 2005; Moreira, 2005; Hilker, 2006; TheWatt, 2006; Wald, 2006) (see Chapter 5, Section 5.3.1.2, Keeping up with future demand – global deficits of the 21st century).

Meanwhile, oil is king and to be cherished by those dependent on it to drive their economies.

The United States is not waiting around to see if cost-effective technologies can be developed to extract oil or produce alternative energy.

“As a consequence of the impending interplay of U.S. energy security interests and African economic developmental goals, the United States is on the verge of an historic, strategic alignment with West Africa”, the Gulf of Guinea emerging “as a new energy center of gravity and a vital U.S. interest” (AOPIG, 2002).

Oil security and counter-terrorism form the backbone of the U.S. Africa policy (Booker & Colgan, 2004). A 1997 evaluation in foreign aid and development by the U.S. Congress (CBO, 1997) raised concern that with the end of the Cold War, a potential threat facing the United States, and for that matter the West,

“may be the spread of weapons of mass destruction, especially if combined with political instability. An internal conflict in a developing country that became a regional conflict would have

dire consequences for U.S. allies if it involved use of nuclear, chemical, or biological weapons - not to mention the potential impact on the regional and global environment. In 1994, a brief survey of the world's trouble spots show(ed) a fairly striking correlation between economic malaise on the one hand and domestic unrest and political instability on the other. If the United States can address those problems by using its foreign aid to help to create economic opportunities and invest in human capital, then the chance of conflict may be reduced" (CBO, 1997).

The following are excerpts from presentations made on April 6, 2001, when U.S. Congresswoman Cynthia McKinney (D), GA. sponsored a forum to assess the impacts of globalization on the exploitation of Africa's resources. McKinney sat on the House International Relations Committee. She is African-American. More detailed case studies will follow to support these statements.

"...investigations into the activities of Western governments and Western businessmen in postcolonial Africa provide clear evidence of the West's long-standing propensity for cruelty, avarice, and treachery. The misconduct of Western nations in Africa is not due to momentary lapses, individual defects, or errors of common human frailty. Instead, they form part of a long-term malignant policy designed to access and plunder Africa's wealth at the expense of Africa's people...The West has, for decades, plundered Africa's wealth and permitted, and even, assisted in slaughtering Africa's people. The West has been able to do this while still shrewdly cultivating the myth that much of Africa's problems today are African made--we have all heard the usual Western defenses that Africa's problems are the fault of corrupt African administrations, centuries-old tribal hatreds, the fault of unsophisticated peoples. But we know that those statements are all a lie. We have always known it...at the heart of Africa's suffering is the West's, and most notably the United States', desire to access Africa's diamonds, oil, natural gas, and other precious resources. You will hear that the West, and most notably the United States, has set in motion a policy of oppression, destabilization and tempered, not by moral principle, but by a ruthless desire to enrich itself on Africa's fabulous wealth. While falsely pretending to be the friends and allies of many African countries, so desperate for help and assistance, many western nations have in reality betrayed

those countries' trust--and instead, have relentlessly pursued their own selfish military and economic policies. Western countries have incited rebellion against stable African governments by encouraging and even arming opposition parties and rebel groups to begin armed insurrection" (McKinney, 2001).

"More troubling than these overt problems are those that involve covert assistance to the Rwandan and Ugandan militaries. Sources in the Great Lakes region consistently report the presence of a U.S.-built military base near Cyangugu, Rwanda, near the Congolese border. The base, reported to have been partly constructed by the U.S. firm Brown & Root (today Kellogg, Brown and Root), a subsidiary of Halliburton (U.S. Vice President Cheney, under the George W. Bush administration, is a former Halliburton chief executive), is said to be involved with training Rwandan Patriotic Front (RPF) forces and providing logistics support to their troops in the DRC" (Madsen,⁵¹⁵ 2001 *In: McKinney, 2001*).

"According to a survey by the Center for Public Integrity and the International Consortium of Journalists, Halliburton is first and foremost among a dozen or so U.S. firms that fit the category of 'Private Military Companies/Contractors (PMCs)' – primary service providers of high-tech warfare including communications and intelligence, logistical support, and battlefield training and planning" (Phillips, 2004).

13.7.1.1 Legitimization of private military companies/contractors (PMCs) by Western governments and international bodies

Private Military Companies/Contractors (PMCs) were unheard of in the English language prior to 1995, but are now in effect legitimized by Western governments and politicians (Campbell, 2002).

'Mercenaries' are officially outlawed under Article 47 of the Geneva Convention, which defines them as persons recruited for armed conflict by or in a country other than their own and

⁵¹⁵ Author of *Genocide and Covert Activities in Africa 1993-1999*, Lewiston, NY: The Edwin Mellen Press, 1999.

motivated solely by personal gain. However, few modern PMCs fit that definition and, indeed, spokesmen for such companies insist they rarely engage in combat and provide military skills only to legitimate, internationally recognized governments. The ICIJ (International Consortium of Investigative Journalists) investigation found that a wide range of companies – from large corporations that offer military training, security, landmine clearance and military base construction to start-up entrepreneurs offering combat services and tactical training – are in what has become the complex and multibillion-dollar business of war (Peterson, 2002).

Peterson (2002) provides an excellent overview of PMCs and how they get around international and national laws, working through official government agencies that have need of their services.

Since 1994, the U.S. Defense Department has entered into over 3,000 contracts with PMCs valued at US\$ 300 billion, with 2,700 of the contracts with just two companies; Kellogg Brown and Root,⁵¹⁶ the Halliburton⁵¹⁷ subsidiary, and the Virginia-based Booz Allen Hamilton⁵¹⁸ (Peterson, 2002; Phillips, 2004). Peterson (2002) estimates a total of 24 U.S.-based PMCs. “British mercenary operators have been employed by the CIA, the Drug Enforcement Agency and the U.S. State Department, as well as by Britain’s own Secret Intelligence Service (SIS)” (Campbell, 2002). The use of PMCs privatizes military functions, circumventing oversight by and accountability to the U.S. Congress and allows the executive branch to evade congressional limitations of troop strength. PMCs can enter into combat without officially committing the U.S., while avoiding U.S. neutrality laws and public/congressional attention (Phillips, 2004).

“The increasing reliance by the Department of Defense on so-called Private Military Companies/Contractors (PMCs) is of special concern. Many of these PMCs, once labeled as ‘mercenaries’ by previous administrations when they were used as foreign policy instruments by the colonial powers of France, Belgium, Portugal, and South Africa, have close links with some of the largest mining and oil companies involved in Africa today...America’s policy toward Africa during the past decade, rather than seeking to stabilize situations where civil war and ethnic turmoil reign supreme, has seemingly promoted destabilization. Former Secretary of State Madeleine Albright was fond of calling pro-U.S. military leaders in Africa who assumed power by force and then cloaked themselves in civilian attire, ‘beacons of hope’ ” (Madsen, 2001 *In: McKinney*, 2001).

“The strong links between the U.S. government and many of the Private Military Companies/Contractors (PMCs) that contract with them has presented questions regarding the revolving door between government and the private sector”,

such as U.S. Vice President Cheney’s link to Halliburton (former CEO) and its subsidiary Kellogg, Brown and Root, and former defense secretary in the Reagan administration Frank Carlucci’s links to the Carlyle Group⁵¹⁹ and its subsidiaries (Peterson, 2002). The Virginia-based PMC, DynCorp International⁵²⁰ has just trained 500 recruits of Liberia Armed Forces, while also carrying out police training in Iraq and Afghanistan (Schwarz & Collins, 2007). Madsen (1999) describes DynCorp as a mercenary group, major contractor for the U.S. military and intelligence communities, active in Angola and other Sub-Saharan African countries.

⁵¹⁹ Carlyle Group, 1001 Pennsylvania Avenue, NW, Washington, DC 20004-2505, United States, Tel: 202 729 5626, Fax: 202 347 1818 <http://www.thecarlylegroup.com/eng/index.html>. In fact, since the 18th century, mercenaries have been used by the colonial powers in Africa as extensions of mercantile expeditions pioneering the colonization of African territories, as well as the suppression of African aspirations for self-determination and political independence (Musah & Fayemi, 2000). Private European companies maintained private armies in the colonies to ensure compliance with company law, including forcing Africans to pay head taxes in cash or kind (e.g., rubber quotas, labor) and to work in mines and plantations (Sachs, 2005). Examples include the *Compagnie Francaise de L'Afrique de l'Ouest* (CFAO) and the *Société Commerciale Ouest Africaine* (SCOA) who had security forces paving the way for the expropriation of resources (Musah & Fayemi, 2000). Though by then a benign trading company, CFAO was still operational in the Gambia during the 1980s, when the principal author lived in West Africa.

“In reality, these leaders, who include the current presidents of Uganda, Rwanda, Ethiopia, Angola, Eritrea, Burundi, and the Democratic Republic of Congo preside over countries where ethnic and civil turmoil permit unscrupulous international mining companies to take advantage of the strife to fill their own coffers with conflict diamonds, gold, copper, platinum, and other precious minerals including one (COLTAN) that is a primary component of computer microchips...Some of the companies involved in this new ‘scramble for Africa’ have close links with PMCs. For example, America Minerals Fields, Inc.,⁵²¹ ” (Madsen, 2001 *In: McKinney, 2001*).

⁵²¹American Mineral Fields is owned by Jean-Raymond Boulle who was a known financial supporter of and signing mining contracts with Laurent Kabila of the Alliance of Democratic Forces for the Liberation of Congo /*Alliance des Forces democratique pour la liberation du Congo* (AFDL/ADFL) before he was even recognized as President by the United States, usurping De Beers and Anglo American. Linked to Robert Friedland of DiamondWorks, the holding company of Branch Mining and Branch Energy linked in turn to the mercenary companies of Sandline International (<http://www.sandline.com/site/>, on April 16, 2004 claims to have closed its doors due to a lack of support by government for PMCs, <http://www.sandline.com/>, info@sandline.com) and Executive Outcomes (EO) (address not found). Both have also been involved in Sierra Leone (Peleman, 2000 *In: Musah & Fayemi, 2000*). American Mineral Fields was “heavily involved in promoting the 1996 accession to power of the late Congolese President Laurent-Desire Kabila, and was at the time of its involvement in the Congo’s civil war, headquartered in Hope, Arkansas (home of former President Clinton)...major stockholders

O'Brien (2000 *In: Musah & Fayemi*, 2000) raises the specter of rival mining companies hiring Private Military Companies/Contractors (PMCs) to fight for control of strategic natural resources within a country. Musah (2000 *In: Musah & Fayemi*, 2000) discusses how rival PMCs, some supporting the government and others the Armed Forces Revolutionary Council (AFRC) junta of Major Johnny Paul Koromah/Revolutionary United Front (RUF) rebels coalition in trying to access Sierra Leone's diamond mines. Many PMCs, while acting as security/mercenary groups have affiliated companies to mine Africa's resources once they have created stability, often as partial payment for their services, even if this stability, as it has proven, is short-lived (Musah & Fayemi, 2000).

The *New African* (2001) reports that Madsen's testimony to Congress also demonstrated direct or indirect complicity by the U.S. Government and/or U.S. "Private Military Companies/Contractors (PMCs)", better known as mercenaries in the training of Ugandans, Rwandans and eastern Zaire youth to overthrow Mobutu Sese Seko, providing intelligence leading to the massacre of hundreds of thousands of Hutu refugees by the Rwandan Patriotic Front (RPF), as well as U.S. Special Forces soldiers marching into Kinshasa in 1996 to help Kabila overthrow Mobutu Sese Seko. One of these PMCs, RONCO⁵²² (see Chapter 7, Section 7.8.5, Politics of Proposed Dams on the Gambia River), in Rwanda consisted of largely former U.S. Special Forces personnel that provided explosives, armored vehicles and transport to RPF rebels, assisting their movement into both Rwanda and the Democratic Republic of Congo in contravention of the U.S. initiated UN arms embargo. The U.S. insisted that RONCO was only involved in de-mining,

included long-time associates of former President Clinton going back to his days as Governor of Arkansas...also reportedly enjoys a close relationship with Lazare Kaplan International, Inc., a major international diamond brokerage whose president remains a close confidant of past and current administrations (U.S.) on Africa matters" (Madsen, 2001 *In: McKinney*, 2001).

⁵²² RONCO Consulting Corporation, 2301 M Street, N.W., Suite 400, Washington, DC 20037, www.roncoconsulting.com/index.html.

even though most de-mining was undertaken by joint army, Air Force and Navy Ordinance Detachments periodically sent to Rwanda from bases in the United States and Europe (Madsen, 1999). The second oldest profession in the world, after prostitution, has been resurrected and is living and doing well globally, supported by the U.S. and other Western governments.

The PMCs have strong ties to some of the largest mining and oil companies involved in Africa today, as well as Ugandan and Rwandan militaries responsible for pillaging the Congo's natural resources. In fact, America has a long history of supporting both sides in order to gain access to the Democratic Republic of Congo's natural resources (*New African*, 2001). This is brought out in great detail in Madsen's book (1999), *Genocide and Covert Operations in Africa, 1993-1999*.

The former colonial powers of France, Belgium and England have also frequently employed mercenaries (Musah & Fayemi, 2000), as have the WWF in anti-poaching using KAS Enterprises run by the founder of the British SAS⁵²³, Colonel Sir David Stirling, and the founder of the PMC, Watchdog International (O'Brien, 2000 *In:* Musah & Fayemi, 2000), as well as the World Bank, United Nations and humanitarian NGOs to protect their personnel in regions of conflict (O'Brien, 2000 & Musah, 2000 *In:* Musah & Fayemi, 2000). Parker (2004) goes into great detail in the WWF's employment of Stirling and KAS Enterprises in a program called Operation Lock, who, while working out of South Africa, were prepared to kill poachers outside the law, without a jury or trial, as a means of dealing with elephant and rhino poaching in southern Africa; what Parker refers to as simple terrorism. While training some government anti-poaching teams, Potgieter (1995) gives one the impression the main goal of Operation Lock was to expose the rhino horn and ivory smuggling networks. Parker (2004) also links WWF, especially the WWF/South Africa, through Operation Lock in illicit rhino

⁵²³ Special Air Services.

and ivory trade linked to support of various rebel groups supported by South Africa, including the National Union for the Total Independence of Angola /*União National Para a Independência Total de Angola* (UNITA) in Angola and the *Resistência National Moçambicana* (RENAMO) in Mozambique, while both Potgieter (1995) and Parker (2004) also identify the South African Defense Force as the culprit (see Chapter 10, Section 10.5, RHINO, TRADE OR TRADE CONTROL, WHAT'S BEST FOR CONSERVATION?). Potgieter (1995) places the ultimate failure of Operation Lock as being high jacked by South African intelligence as a front to gather information in surrounding countries hostel to South Africa.

The World Economic Forum (2004) reports that Private Military Companies/Contractors (PMCs) are

“a \$100 billion business globally, with the United States deploying 1 private military worker for every 10 soldiers in Iraq—a 10-fold increase since the 1991 Gulf War. The shortage of mainstream troops available for peace enforcement purposes, including mainstream UN-mandated peace operations, is generating renewed interest in the hitherto taboo topic of the direct engagement of private military companies for combat”.

To say the least, it is shocking when mercenaries become accepted into mainstream society. Similarly, in many developing countries, especially in Sub-Saharan Africa, security companies with armed rapid response teams, in essence PMCs, guarding rich homes from the poor masses have developed into big businesses, undertaking what was traditionally the duty of the police, which the police can no longer fulfill due to the magnitude of the problem.

“It is the whole political economy of southern resource rich countries and their relations with the north that needs to change if inequalities and recurring conflicts are to be avoided” (LeBillon, 2000 *In: Cilliers & Dietrich, 2000*).

13.8 FRANCE/U.S. ANGLOPHONE COMPETITION FOR INFLUENCE AND RESOURCES IN AFRICA – NEW SCRAMBLE FOR AFRICA

“ ‘The last decade’s scramble for Africa saw growing rivalries between U.S. and French oil companies, as deep-water technology opened up new fields off West Africa. Swift expansion followed, as countries called in the oil majors and hoped for a big find. The result was years of fast growth, big signature bonuses and blurred borders between politics and business’ ” (*Africa Confidential*, 2002a In: Gary & Karl, 2003).

In 1898, in the town of Fashoda, southern Sudan, the French routed the British in Cecil Rhode’s quest for a Cape Town to Cairo railway. Britain eventually won out, but the “Fashoda Syndrome” would guide future French leaders in the relations between France and Britain in Africa. Former French President Francois Mitterrand summed up the geo-political view of France towards Africa,

“‘Without Africa, France will have no history in the 21st century’ ” (Madsen, 1999). Current President Jacques Chirac goes on to say, “ ‘France is not in the habit of just occasionally rediscovering Africa (as in recent times, with short visits by U.S. presidents or envoys) because of a chance trip, a crisis, economic turbulence or a climatic catastrophe...France has been (Africa’s) attentive partner for a long time’ ” (Madsen, 1999).

U.S. demand for oil is growing significantly, from 19.7 mbd⁵²⁴ in 2002 to an estimated 26 mbd in 2020 (Gary & Karl, 2003).

“As U.S. energy companies become more involved in Africa, so too does the U.S. Government, driven by both national security and economic concerns. In a global environment shaped by fears of terrorism and instability in the Middle East, Africa is suddenly no longer considered a strategic backwater; a major reason is oil” (Gary & Karl, 2003).

⁵²⁴ By international agreement, a barrel of petroleum equals 42 U. S. gallons, which is about 159 liters (UNC, 2004).

The 19.5 mbd of oil consumed by the USA constitute 26% of daily global oil consumption and amounts to importing 9.8 mbd or more, more than half the oil it consumes. The surest way for the U.S. to sustain its overwhelming dependence on oil is to control the 65-67% of the world's oil reserves in the Persian Gulf (Klare, 2001; Mailer, 2003). In addition, the Gulf of Guinea is expected to provide 25% of America's oil by 2015 (GPF, 2002; Booker & Colgan, 2004; Commission for Africa, 2005; CRS, 2007), making countries such as Angola, Cameroon, Chad, Congo Brazzaville, the Democratic Republic of Congo, Equatorial Guinea, Gabon and Nigeria critical to its foreign policy/agenda in Sub-Saharan Africa (Booker & Colgan, 2004).

“The Gulf of Guinea region will receive more than US\$ 200 billion in oil revenues over the next decade and overall production is expected to jump from 3.8 million barrels per day (bpd) in 2003 to 6.8 million bpd by 2008” (CAFOD, 2004).

This is supported by Gary & Karl (2003), estimating that US\$ 200 billion in oil revenue will accrue to Sub-Saharan African governments over the next decade.

“Declines in production from mature producers, e.g. Gabon or Cameroon, will be more than offset by large increases in production in Nigeria, Angola and Equatorial Guinea, as well as the arrival of new producers including Chad, possibly São Tomé and Príncipe and others. If anything, the figure of US\$ 200 billion will, in the end, prove to be far too low” (Gary & Karl, 2003).

Studies indicate that the greatest increase in oil production globally in the next decade is likely to come from West Africa. The U.S. is following this trend closely (Booker & Colgan, 2004).

13.8.1 United States Entry into Post WWII Imperialism

In his farewell speech to the nation, America's Dwight D. Eisenhower warned its citizens to beware of the military-industrial complex and its threat to the very structure of America's society.

"We now stand 10 years past the midpoint of a century that has witnessed four major wars among great nations. Three of these involved our own country. Despite these holocausts America is today the strongest, the most influential and most productive nation in the world. Understandably proud of this pre-eminence, we yet realize that America's leadership and prestige depend, not merely upon our unmatched material progress, riches and military strength, but on how we use our power in the interests of world peace and human betterment. Throughout America's adventure in free government, our basic purposes have been to keep the peace; to foster progress in human achievement, and to enhance liberty, dignity and integrity among people and among nations. To strive for less would be unworthy of a free and religious people...Progress toward these noble goals is persistently threatened by the conflict now engulfing the world. It commands our whole attention, absorbs our very beings. We face a hostile ideology-global in scope, atheistic in character, ruthless in purpose, and insidious in method. Unhappily the danger it poses promises to be of indefinite duration...with liberty at stake...A vital element in keeping the peace is our military establishment. Our arms must be mighty, ready for instant action, so that no potential aggressor may be tempted to risk his own destruction..."

Until the latest of our world conflicts, the United States had no armaments industry. American makers of plowshares could, with time and as required, make swords as well. But now we can no longer risk emergency improvisation of national defense; we have been compelled to create a permanent armaments industry of vast proportions. Added to this, three and a half million men and women are directly engaged in the defense establishment. We annually spend on military security more than the net income of all United States corporations.

This conjunction of an immense military establishment and a large arms industry is new in the American experience. The total influence-economic, political, even spiritual - is felt in every city, every state house, every office of the Federal government. We recognize the imperative need for this development. Yet we must not fail to comprehend its grave implications. Our toil, resources and livelihood are all involved; so is the very structure of our society.

In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. The potential for the disastrous rise of misplaced power exists and will persist..." (Farewell Address, Dwight D. Eisenhower, January 17, 1961, 34th U.S. President and Supreme Commander of the Allied Forces in Europe during WWII *In: Eisenhower Library*, 2004).

Integration of military and business interests have evolved to the point that they can perpetuate international conflict as a means of driving the economy (Phillips, 2004).

Kinzer (2006) provides an excellent historical overview of American imperialism. The United States post WWII military-industrial complex's imperialistic entry into manipulating governments and economies can be traced back to two incidents in the late 1940s and early 1950s in the Middle East of all places, which, like Africa, is resource rich, while most of its people are poor and anarchy seems to be lurking at every crossroads and corner. Ultimately,

"control over the Persian Gulf⁵²⁵ translates into control over Europe, Japan and China (economic competitors). It's having our hand on the spigot" that controls the flow of oil (Phillips, 2004).

After WW I, the Russian Revolution and the fall of the Ottoman Empire, similar to Africa, the Western powers carved up the Muslim world into "states" that had nothing to do with the traditional boundaries of the indigenous population. They imposed new and alien elites, either royal families propped up by the West or Communist elites propped up by the Soviets, often leading to repressive military dictatorships, which magnified the gap between the rich elite and the impoverished masses, leading to much of the friction that exists at the beginning of the 21st century (Bodansky, 2001; Catherwood, 2004).

⁵²⁵ The two largest sources of oil in the Gulf are Saudi Arabia with 262 billion barrels of proven reserves and Iraq with 120 billion barrels (Phillips, 2004).

13.8.1.1 Incest and the house Of Sa'ud

The Persian Gulf contains an estimated 65% of the world's untapped petroleum reserves. This area encompassing Saudi Arabia, Iran, Iraq, the United Arab Emirates and Qatar is of strategic importance to the West and a source of continual conflict from the invasion and occupation of this region by foreign non-Muslim troops representing the U.S. and its allies; a recipe for recurring violence (Klare, 2001) and recurring terrorism against the perceived aggressors.

Much to the surprise of the British, when Ibn Saud named his new kingdom Saudi Arabia in 1932, he gave all the main oil concessions to the United States and the new company it would create, Aramco, resulting in a long and incestuous relationship (Catherwood, 2004).

In 1933, King Abdel Aziz granted a concession to the U.S. company Standard Oil to explore for oil in the Eastern Province. The joint enterprise was known as the Arabian American Oil Company (Aramco). In 1938, commercial quantities of oil were discovered. By the 1940s, the U.S. began to court the kingdom as it realized the strategic importance of Saudi oil reserves. In 1950, Saudi Arabia and Aramco agreed to a 50-50 profit-sharing arrangement. In 1988, King Fahd, taking full control of the company, established the Saudi Arabian Oil Company, known as Saudi Aramco, to replace Aramco (PBS, 2001). Since 1948, the United States has provided the use of its military as a means of propping the royal family of Al Sa'ud at the expense of the general population, resulting, among other things, in a fall in per capita income of Saudi citizens by more than 60% in the last 20 years (e.g., since about 1980) (Baer, 2003). By 1951, under a mutual defense agreement, the U.S. established a permanent U.S. Military Training Mission in the kingdom, agreed to provide training to the Saudi armed forces and to construct military installations in the kingdom; growing into a longstanding security

relationship (PBS, 2001). As fast as the United States buys Saudi crude oil at a discounted rate, about US\$ 1 less per barrel than the Asians, the Saudi's turn around and spend their profits on U.S. weapons, construction and communications services, increasing from US\$ 56.2 million in 1950 to US\$ 19.3 billion in 2000 (Baer, 2003); half its annual revenue on defense (Baer, 2003). Perkins (2006) goes into some detail over the development of this relationship with the House of Sa'ud through the United States-Saudi Arabian Joint Economic Commission (JECOR) in which petrodollars hired American firms to build up Saudi Arabia. The program was run through the U.S. Treasury Department with virtually no congressional oversight. Middlemen on both sides become rich, including the royal family in Saudi Arabia, as well as politicians from the Washington oligarchy, due to a revolving door allowing them to go into the private sector after leaving government to work for the manufacturers and procurers and/or directly for the Saudis.

"We in the West and the Saudi rulers themselves are in serious trouble. All the ingredients of upheaval are in place: open borders, the availability of arms, political alienation, the absence of a rule of law, a completely corrupt police force, a despised ruling class, plummeting per capita income (and fabulously wealthy rulers to remind the poor of how poor they are), environmental degradation, surly neighbors, and a growing number of young home-grown radicals who care more about righteous murder than they do about living. The kingdom's schools churn out fanatics faster than they can find wars to fight" (Baer, 2003).

The petrodollars were also used to fund the construction of new mosques and Muslim religious schools (*madrasas*) in Saudi Arabia and across the world -- fueled by the strict Wahhabi interpretation of Islam -- that evolved into a network of recruiting schools that were to train Islamic militants (BPS, 2001; Baer, 2003), serving as a catalyst for development of the disciples of terrorism. The Al Sa'ud family pay off Muslim terrorists to leave the royal family of Al Sa'ud alone, the very terrorist organizations who are attacking the West (e.g., Muslim

Brotherhood, Wahhabis, Taliban, etc.) – in many cases angry with how the West has treated the Middle East (Bodansky, 2001; Baer, 2003) . Osama bin Laden is a Saudi by birth, a product of the local *madrasas* (Muslim schools) and universities (studied management and economics) and angered by the U.S. propping up the royal family he accused of sacrificing Islam and the sanctity of Saudi Arabia to infidels for money, bribes and dirty deals; allowing the presence of infidel military troops from the U.S. on Saudi soils, allowing Western values (morality) into the Middle East, as well as materialism; all of which he considers a threat to traditional Islamic society (Bodansky, 2001; Phillips, 2004). Catherwood (2004) comes to similar conclusions. Bodansky (2001) believes that since the Muslim world lacks the military and scientific technologies to take the West head-on, they feel that the only way to confront the situation is through international terrorism.

Though free education (although deteriorating – Bodansky, 2001) and health care exist in Saudi Arabia, there is high unemployment, while the royal family spends state revenue and their kickbacks on palatial mansions around the world, women, booze and armaments among other things (Baer, 2003).

“...at least 10,000 princes from the House of Sa’ud receive stipends running from \$800 to \$270,000 per month while the rest of the fast-growing population sees its opportunities decline. Even where proven reserves are the greatest in the world, productivity has taken a nose dive and per capita income has plunged from \$28,600 in 1981 to \$6,800 in 2001” (Gary & Karl, 2003).

While no one can sanction 911, undertaken mostly by Saudi radicals (15 of 19 hijackers were Saudis - CNN, 2002a), one can clearly understand the anger and rage towards America by the average Saudi. In October, 2001, in a poll of educated Saudis between 25 and 41 years old, 95% supported bin Laden (Baer, 2003).

“Sure, we’ve lost control of our country, and our citizens are slaughtering yours, but you can depend on us to keep your cars on the road and your houses warm. And by the way, you’ll feel better if you don’t think about the unpleasant reality that your oil bank is sitting on dangerously shifting sands” (Baer, 2003).

While the U.S. obtains only 8% of its crude from the Saudis, Saudi Arabia sits on 25% of the world’s proven reserves. Forget democracy and freedom, what is happening in the Middle East, including Iraq, is all about natural resources to the benefit of the West, especially America’s oligarchy. As “popular discontent and upheaval were closing in on the House of Sa’ud” the decision to seize Iraq emerged as a vital underpinning of U.S. foreign policy (Phillips, 2004). According to U.S. Deputy Defense Secretary, Paul Wolfowitz,⁵²⁶

“ ‘for bureaucratic reasons, we settled on one issue...weapons of mass destruction, because it was the one reason everyone could agree on,’ but another reason was that the ousting of Saddam (Hussein, a former U.S. ally against Iran) would make it possible to base U.S. troops in Iraq and remove them from Saudi Arabia’ ” (Phillips, 2004)

that would meet an important al-Qaeda demand, while allowing the U.S. with its military to control the Middle East and the flow of oil⁵²⁷ (Phillips, 2004), thus redrawing the geo-political map of the Middle East. Perkins (2006) hypothesizes that had Saddam Hussein developed the same relationship with the U.S., where petrodollars were poured back into employing American companies to develop

⁵²⁶ Principle architect of Iraq invasion. Under the George W. Bush administration and in 2005, under the same administration, nominated and voted in as President of the World Bank. Forced to step down from World Bank in June 2007 due to controversy over Bank ethics violations (Wood, 2007).

⁵²⁷ Carothers (2007), Sachs (2005), Phillips (2004) raise concern that current U.S. policy in the Middle East is linked not only to oil, but to Christian fundamentalists who in recent years have aligned themselves with the Bush Administration and their belief that current events in the Middle East are linked to the biblical Armageddon, the last decisive battle between good and evil before Judgment Day. In these beliefs, the Israeli state must exist at all costs for this historical biblical scenario to be played out. Christian, Jewish and Muslim prophecies converge, anticipating a great confrontation in the Middle East (Phillips, 2004).

Iraq, there would likely have been no invasion. There is growing concern that in developed capitalist countries, multi- or trans-national corporations (and one could add trans-national NGOs) determine global economic, social and environmental policies of governments (Bond, 2002).

13.8.1.2 United States adventurism in Iran

The second major step in U.S. imperialism that has helped to pave the way in how America relates to Africa and the rest of the world, is the orchestrated overthrow of democratically elected pro-American, but nationalist, Iranian Prime Minister Mohammad Mossadegh by America and Britain in 1953 in favor of putting back into power a puppet government controlled by the dictatorial King Reza Shah, moving from an open free society to one of suppression and brutality.

Mossadegh was *Time* magazine's Man of the Year in 1951 (Perkins, 2006). Perkins (2006) marks 1951 as a decisive moment in history in which the major force in the creation of empires moved from military force, now too risky with the emergence of the Soviet Union as a nuclear power, to covert operations and later, economic manipulation. Mercantilism and control of resources was/is still at the heart of empire building, as it had been from the 16th to the 18th centuries, where those with power and limited resources exploited/exploit those with abundant resources, but no power.

Mossadegh's overthrow occurred because of his nationalization of British controlled oil in Iran, which at the time supplied 90% of Europe's petroleum. The reason behind the nationalization was that the Anglo-Iranian oil company paid off the Shah, while selling the oil for 10-30 times what it cost to produce. Britain had risen to world power largely because of its success in exploiting the natural resources of subject nations. Foreign Secretary Bevin stated that without oil from

Iran there would be “ ‘no hope of our being able to achieve the standard of living we are aiming at in Britain.’ ” (Kinzer, 2003). In 1947, Anglo-Iranian made an after-tax profit equivalent of US\$ 112 million, paying the equivalent of US\$ 2.5 million to Iran. One way they maximized their profits was by their British employers living in luxury homes with green lawns, tennis courts, swimming pools and clubs, while the Iranian workers lived in undeveloped slums with no running water or electricity, few environmental controls, no vacation, no sick leave, no disability compensation and homes made from cobbled oil drums. Britain convinced a reluctant America of a communist threat. Truman refused to do Britain’s dirty work, while Eisenhower appears to have been coerced by misinformation provided by the ambitious Dulles brothers (Allen at CIA and John Foster at the U.S. State Department), driven by power and the perceived communist threat. They took a virtually unknown Central Intelligence Agency (CIA) into what would become a powerful instrument of the Cold War with a *modus operandi* - covert actions to shape the course of world events (Kinzer, 2003; Perkins, 2006). In many instances, the CIA orchestrated who would become the president or prime minister of a particular country, as a means of keeping out the communists or letting in America’s industrialists. The over-throw of the Shah in 1979 led to an anti-American Islamic Revolution which can be linked to holding 52 Americans hostage at the U.S. Embassy in Tehran for 14 months, the rise of radical Muslim fundamentalism, the view of America as “the Great Satan”, the financing of radical groups such as the Hamas and Hezbollah (HizbAllah), the 1983 Beirut bombing that killed 214 marines, the 1996 bombing of Khobar Towers in Saudi Arabia that killed 19 marines and the embassy bombings in Kenya and Tanzania in 1998 (Kinzer, 2003). Bodansky (2001) states that just about all terrorism is state sponsored in one way or another.

“It is not far-fetched to draw a line from Operation Ajax (British/American operation to depose Mossadegh) through the Shah’s repressive regime and the Islamic Revolution to the

fireballs that engulfed the World Trade Center in New York. The World has paid a heavy price for the lack of democracy in the Middle East" (Kinzer, 2003).

Some call this orchestrated "American democracy" resulting in "blowback", "the fierce and terrorist-mobilizing resentment incited by U.S. policies, bombings and covert operations, especially over the last 3 decades" (Phillips, 2004). As will be seen, these two steps set the stage for American imperialism in Africa, putting in puppets, propping up despots and manipulating economies over and over again, first to fight the Cold War and since the 1990s, to mine the natural resources of one of the richest (if not the richest) continents in the World; Africa.

13.8.2 American Imperialism in Sub-Saharan Africa, a Struggle for Control of Francophone Africa

"In Cameroon, Benin, Burkina Faso, Gabon and Niger in 1997, I found abundant evidence of unrestricted raw materials extraction by interests associated with the United States. The people of the oil-producing areas of the Niger River Delta are suffering horrendous atrocities..."

So I see it as a policy of depopulation in Africa. Because what I am talking about is access. That's all. Access to the animals. Access to the game parks and trophy fishing. Access to the minerals. Access to the cheap and replenishable labor pool. Access to uninformed populations to dump inferior and toxic and outdated products on. Access for military adventurism and special forces training and psyops operations. Access to biological and pharmaceutical testing grounds. Access to markets. And while at times it seems contradictory, at times it is, but it's all completely unethical, entirely arrogant and racist. It is driven purely by greed. And the profound human suffering is totally unnecessary" (Snow, 2001 *In: McKinney, 2001*).

"The West, and particularly the United States, is dependent upon the availability of strategic minerals, many of which the U.S. does not produce" (Hartung & Montague, 2001),

Sub-Saharan Africa being a major source of raw materials. According to Alemayehu (2000), strategic metals such as platinum, vanadium, manganese ore and chrome ore come primarily from South Africa and the Soviet Union. From 80-85% of the ferromanganese, ferrochrome, cobalt, manganese ore and metal, chromite and graphite used by the U.S. come from Africa. From 40-100% of germanium, selenium, indium, rhodium, cesium, iridium and phlogopite used by the U.S. in electricity, electronic, photo and optics, come from Africa. From 90-100% of the palladium and chrome chemicals used in the U.S. packaging, medical and chemical industries are from Africa, as well as 100% of the diamonds, corundum, amosite and crocidolite used in gems, abrasives and insulation by the U.S.

13.8.2.1 America's entry into imperialistic adventures in Sub-Saharan Africa

America's entry into imperialistic adventures on the subcontinent began in the 1960s under the Kennedy administration in support of 31 year old Chief of Staff of the Army, Joseph Mobutu Sese Seko, who seized control of power (see Chapter 11, Section 11.6.6.1, The Katanga story, an "African Solution" to democracy thwarted by the "Cold War" and beginning of French/American struggle over a quest for Africa's riches) and continues today by the William (Bill) Jefferson Clinton and Bush administrations for Laurent and then Joseph Kabila (see Section 13.10.3.4, Corporate wars) (Figure 13.3). By the 1990s, the United States had taken over from Britain as the major threat to Francophone interests on the African continent (Madsen, 1999). This lays much of the backdrop for many of the current crises in post-Cold War Africa, in which espionage and politics, as well as "economic intelligence" towards Africa is linked to obtaining an economic advantage, as opposed to Cold War military superiority (Madsen, 1999). Yet at what cost to Sub-Saharan Africa and its people, as former Cold War allies vie for power of Africa's natural resources?

13.8.2.2 America declares the end of France's *chasse gardeé*

In 1995, it was stated in a Washington Times (1995a) article that despite 35 years of independence, Francophone African countries remain French dependencies that are run largely from Paris. The question of who runs a given country is often settled in the Elysee Palace, with key ministries in Francophone African governments being peppered with French technical advisors and a military trained and equipped by France. Under President Francois Mitterrand, there existed an "African Cell" run by his son Jean-Christophe Mitterrand. It was rumored that the Mitterrand family had strong logging interests in Francophone Africa. The French gave these countries stability and their leaders security through a common currency, the *Communauté Financière Africaine* (CFA) franc, and military protection, while the French got an empire run by the French President. Under the current French President, Jacques Chirac, this has continued (Huliaras, 2002 *In: Zack-Williams, et al.*, 2002).

From 1989-94, France's policy towards Africa, as its continental economy declined, can be described as benign neglect. However, from 1994-97, a period of defensive action (Huliaras, 2002 *In: Zack-Williams, et al.*, 2002) took place in an attempt to protect France's sphere of influence over its former African colonies and other Francophone African countries (e.g., Zaire/the Democratic Republic of Congo and Rwanda), many containing important natural resources which America had decided to begin trying to access. This has resulted, directly or indirectly, in resource wars fought by proxies, as both France and its multinationals vie for maintenance of spheres of traditional resource extraction against aggressive moves by the American government and its multi-nationals to take control of these areas (Madsen, 1999). The cost to humanity and development of the continent is untold as these Western powers vie for control.

The 1994-1997 events in the Great Lakes were seen by French politicians as evidence of an American conspiracy to oust France from Africa (Huliaras, 1998 *In: Huliaras, 2002 In: Zack-Williams, et al., 2002; Madsen, 1999*). The victories of the Anglophone Tutsis in Rwanda and the success of Laurent Kabilas forces in Zaire (the Democratic Republic of Congo), who were supported by the United States through Rwanda and Uganda as proxies, were considered by Paris as major defeats (Hugeux, 1997 *In: Huliaras, 2002 In: Zack-Williams, et al., 2002; Madsen, 1999*). France viewed the collapse of its *protégées* in Rwanda and Zaire as part of a UN Anglo-Saxon plot to steal its sphere of influence (Economist, 1997 *In: Huliaras, 2002 In: Zack-Williams, et al., 2002*). France viewed this as part of an American conspiracy against *la francophonie* (Huliaras, 2002 *In: Zack-Williams, et al., 2002*), French culture and influence in Africa. As will be seen below, the resource war in Congo Brazzaville was funded by competing American and French oil companies.

France actually tried to help the Hutu dominated Habyarimana regime in Rwanda halt the invasion of the Tutsis from neighboring Uganda and then helped the Hutu soldiers escape to Zaire with their weapons (Madsen, 1999; Huliaras, 2002 *In: Zack-Williams, et al., 2002*), even going so far as to arm them in Rwanda at the beginning of the 1994 massacres and again in the Democratic Republic of Congo where there were more massacres (Madsen, 1999). When Kabilas began his 1996 invasion of the Democratic Republic of Congo (Zaire), Paris proposed UN international military intervention to protect the Mobutu Sese Seko regime, but the William (Bill) Jefferson Clinton Administration prevented this, as it went against its agenda (Madsen, 1999) as the back door or gateway into the riches of the Democratic Republic of Congo and eventually the Gulf of Guinea. If hundreds of thousands of people died, so what?

Other developments that renewed France's interest in Africa included (Huliaras, 2002 *In: Zack-Williams, et al., 2002*):

- United States post-Cold War economic policies to use American external politics to facilitate U.S. private enterprise penetration into new markets – with the U.S. stating that France's *Chasse Gardeé* (Private Hunting Grounds) in Francophone Africa would no longer be accepted; and
- The disappearance of the colonial generation of French-trained functionaries such as Felix Houphouet-Boigny in Cote d'Ivoire replaced by new leaders, many being U.S.-trained, such as Congo Brazzaville's Pascal Lissouba (see Section 13.10.1.4, Petroleum war, Congo Brazzaville), less willing to “pledge allegiance” to France and looking to develop closer partnerships with the world’s one remaining superpower.

Secretary of State Collin Powell’s immediate departure for oil rich Angola and Gabon (The Gulf of Guinea is France’s Alaska) at the end of the September, 2002 Earth Summit in South Africa must be additional cause for Franco-American strains. In Gabon, Powell met with Omar Bongo and mainly Western NGOs (e.g., WWF, African Wildlife Foundation (AWF) and Conservation International (CI) pledging US\$ 53 million to aid in the development of 12 national parks covering 10% of Gabon’s territory⁵²⁸. He also spoke with Bongo over foreign debt (ANON, 2002a; SENAT, 2002; Jaffe Associates., 2002). When the principal author first visited Gabon (DeGeorges, 1995), the U.S. Economics Officer advised not to come in as an American without French support. Elf (a French oil company) was given non-competitive leases for 13 offshore oil blocks and the U.S.-based firms of Oxypetroleum, Conoco and Mobil pulled out. President Bongo refused to attend an African Trade and Investment Conference because of USA participation, while French officials boycotted the meeting (*Washington Times*, 1995b) (see Section 13.10.1.2, Gabon, France’s Alaska). Thus, Powell’s visit in 2002 must have thrown a real scare into France’s foreign policy agenda, causing even more paranoia as to what the objectives of the Americans are in France’s former African sphere of influence. Certainly, America’s interest in

⁵²⁸ Note: UNEP-WCMC data indicate 4.41% of Gabon in parks and protected areas in 2004 (see Chapter 11, Table 11.10: Sub-Saharan Africa UNEP-WCMC data base of IUCN management categories).

Gabon is not entirely philanthropic, with America hoping to get out of Gabon more than it puts in. With all those American-based NGOs, 70-90% of the US\$ 53 million will funnel back to the USA which, as discussed in Chapter 11 (see Section 11.7.2, Foreign Assistance Conditionalities Good Business for Donor County Not Recipient/Host Country), will be good for America's economy, but will not do much for the poorest of the poor other than to disenfranchise groups like the Pygmies from their natural resources and destroy cultures through the creation of more exclusion zones, regardless of the "community rhetoric" put forth by the Western NGOs [see Chapter 11, Section 11.9, THE NEW SAVIORS OF AFRICA; NGOS and Section 11.10, FOREIGN AID AND THE ENVIRONMENT and Section 11.11.6, Eco-Genocide in Southeastern Cameroon (Division of Boumba-et-Ngoko), the Forest People and the "Dobi Dobi", More Parks and Protected Areas]. In early 2008, the principal author had a half day meeting with a representative of Gabon's national parks, applying to study nature conservation at Tshwane University of Technology. According to Matlands (*pers. comm.*), who is developing a plan for Gabon's national parks network, a policy appears to have existed for a few years that rural communities will remain living in Gabon's protected area network, and be helped to sustainably manage the resources within these areas, including involvement in tourism. While some conservation NGOs accepted this idea openly, others did so reluctantly.

13.8.2.3 American hegemony through contribution of arms and military training in Sub-Saharan Africa

"Since the fall of the Berlin Wall, U.S. arms transfers to Africa have continued, albeit at a slower pace. From 1989 to 1998, the United States provided over \$US 227 million in weapons and training to African military forces, of which over \$US 111 million went to governments that have been directly or indirectly involved in the war in the DRC: Angola, Burundi, Chad, DRC, Namibia, Rwanda, Sudan, Uganda, and Zimbabwe. These figures do not include the \$US 75 million in emergency aid to Rwanda that was

provided in 1994. The United States has repeatedly declared its commitment to promoting peace in the Great Lakes region, and has supported every United Nations Resolution directed toward that goal. Yet the flow of U.S. arms and military training to countries involved in the DRC war has not ceased...During FY 2000, the following countries involved in the war in the DRC or other African conflicts received substantial U.S. training: Chad (\$US 2.9 million), Zimbabwe (\$US 1.4 million), Rwanda (\$US 13 million), Namibia (\$US 5 million), Uganda (\$US 1 million), and Ethiopia and Eritrea (roughly \$US 100,000 each)" (Hartung & Montague, 2001).

"The foundation of a new security structure already exists with EUCOM's (European Command, U.S. Department of Defense) Africa Engagement Plan, which is committed to freedom of navigation, quick response to humanitarian crisis, rule of law, military professionalism, and subordination of African militaries to civil leadership. These operating principles have been exemplified by the formation of the African Crisis Response Initiative (ACRI), the Africa Center for Strategic Studies (ACSS), and the Joint Combined Education Training Program for small unit training" (AOPIG, 2002).

Expansion of the military-industrial complex of America into Africa can also be linked to the African Crisis Response Initiative (ACRI) and the African Center for Security Studies (ACSS). ACRI supposedly trains African troops in peace keeping and humanitarian actions (U.S. Department of Defense, 2001).

"The formation of ACRI was debated by successive U.S. administrations, but its launch without the consent or consultation of Africans created the impression it is primarily an instrument of American foreign policy" (Mburu, 2003).

Mburu (2003) also raises the point that both the Economic Community of West Africa States/*Communaute Economique des Etats d'Afrique de l'Ouest* (ECOWAS/CEDEAO) and the Southern African Development Community (SADC) are more than capable of dealing with regional crises, such as the 2000 floods in Mozambique.

“It is difficult to visualize what ACRI could possibly offer that is outside the capability of the two institutions whose only limitations are the financing and international publicity the American initiative enjoys...ACRI is meant to fill this void but its membership, at least in theory, is open to functioning democracies where the military is under civilian control, a criterion that disqualifies dismembered Somalia, strife-torn Rwanda, Sierra Leone, and the DRC (formerly known as Zaire). Considering that societies under anarchy need security assistance more than orderly ones do, ACRI resembles a feast where invitation is only for those who are not hungry. Participant countries of ACRI include Senegal, Mali, Ghana, Benin, Malawi, Uganda, and Cote d’Ivoire” (Mburu, 2003).

Kenya (ethnic violence and clamp down on political dissents) and Ethiopia (conflicts with Eritrea and western Somalia) were initially barred, but then admitted. Mburu (2003) raises concern that

“admitting countries with unacceptable policies reinforces the suspicion that the real criterion for membership is a country’s geopolitical importance to the U.S. and not good governance as officially posted. The representativeness of the African force is further dented by the abstention of most North Africans (Morocco, Algeria, Tunisia, Libya, Egypt, and Sudan) who suspect America’s insincerity in view of its mixed-signal policy in the Middle East, particularly over Palestinian statehood”.

With regard to ACSS,

“The ACSS aims to support an appropriate military role in democratic governance by offering senior African leaders, civilian and military, a rigorous academic and practical program in civil-military relations, national security strategy, and defense economics...and promote informed and productive inquiry on the military's role in a democracy among non-government civilian leaders, government officials and military officers” (U.S. Department of Defense, 1999).

Similar centers exist at the George C. Marshall Center for Security Studies in Germany, the Asia-Pacific Center in Hawaii and the Center for Hemispheric

Defense Studies in Washington, D.C. (Madsen, 1999; U.S. Department of Defense, 1999).

The Africa Contingency Operations Training Assistance (ACOTA) program was created by the Bush Administration in the spring of 2002 to take the place of the African Crisis Response Initiative (ACRI) in order to provide training in peacekeeping operations and regular military tactics to military units from selected countries in Africa (Kagan, 2003; Volman, 2003). Since 1996, over 8,600 African troops from Senegal, Uganda, Malawi, Mali, Ghana, Benin, Côte d'Ivoire and Kenya have received training through the ACRI program. The training is conducted in the host country by 60-man units of U.S. Special Forces soldiers (Volman, 2003). The most significant difference between the two programs is that ACOTA will include training for offensive military operations, including light infantry tactics and small unit tactics, to enhance the ability of African troops to conduct peacekeeping operations in hostile environments. Under ACOTA, African troops will also be provided with offensive military weaponry, including rifles, machine guns and mortars. This is linked into the African Peacekeeping Program (ARP) (Kagan, 2003; Volman, 2003).

The International Military Education and Training (IMET) program is used to provide professional training to African military officers from 44 countries at U.S. military colleges and other military facilities in the U.S. (Madsen, 1999; Kagan, 2003; Volman, 2003). For instance, since 1965, more than 1,000 Senegalese military officers have trained in the U.S. (U.S. Embassy Dakar, 2004). In Fiscal Year (FY) 2002, IMET expected to provide training to more than 1,600 African officers. African countries that are expected to participate in IMET in FY 2003 include: Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, the Central African Republic, Chad, Comoros, Cote d'Ivoire, the Democratic Republic of Congo, Djibouti, Equatorial Guinea, Eritrea, Ethiopia,

Gabon, Gambia, Ghana, Guinea-Conakry, Guinea-Bissau, Kenya, Lesotho, Madagascar, Malawi, Mali, Mauritania, Mauritius, Mozambique, Namibia, Niger, Nigeria, the Republic of Congo, Rwanda, Sao Tome and Principe, Senegal, Seychelles, Sierra Leone, South Africa, Swaziland, Tanzania, Togo, Uganda and Zambia (Kagan, 2003). Madsen (1999) is concerned about the kind of leadership emerging out of such programs, given the results of the "School of the America's" in Fort Benning Georgia, which is notorious for having produced such repressive dictators and military leaders as Chile's Pinochet, Panama's Noriega and Haiti's Cedras, among others, a school reputed to advocate executions, torture and other human rights violations.

The "Pan-Sahel Initiative" will offer training, vehicles, radios and other equipment to improve security and border surveillance (Blunt, 2004) to Mauritania, Mali, Niger and Chad (Belida, 2004a; Knickmeyer, 2004), designed to enhance border protection and the ability of security forces to track the movement of people, especially in the remote desert frontier regions of the Sahara. Budgeted at a modest \$US 10 million this terminated in 2004 and was followed by an US\$ 80 million budget Trans-Saharan Counter-terrorism Initiative (TSCTI) that links Algeria, Chad, Mali, Mauritania, Morocco, Niger, Nigeria and Senegal to the

"10th U.S. Army Special Forces Group to train military units of partner countries and improve their strategic and tactical coordination with American military and intelligence operations" (Pham, 2007).

In addition, support has been provided by the U.S. State Department and USAID in counter-terrorism (Pham, 2007).

It is believed that U.S. strategic interest in the Sahelian region, stretching from Senegal/Mauritania to the Horn of Africa, has primarily to do with this being a

potential area for terrorism and recruitment thereof, with links to al-Qaeda, and the possibility of this area destabilizing oil rich Algeria to the north and Nigeria/Gulf of Guinea oil producing states to the south (Barth, 2003). In early 2004, the U.S. was considering air strikes of suspected safe havens for al-Qaeda linked armed terrorists groups along the Algeria/Mali border that have been forced out of other countries, such as Afghanistan. In January, 2004, a combined operation saw Malian troops force a suspected terrorist weapons convoy loaded with arms, ammunition and communications gear across the border where it was intercepted by Algerian forces. The U.S. troops in Mali are elite Special Operations forces that can be tasked with actual field missions on an as-needed basis (Belida, 2004b). The major reasons for U.S. concern over this stretch of Africa include:

- The majority of people in this region are Muslim;
- Traditional pastoral (transhumance) and agricultural (fallow) lifestyles are no longer sustainable under current human populations, resulting in major environmental/habitat degradation and a feeling of disenfranchisement and hopelessness among the regions' youth, making them perfect candidates for recruitment by Muslim terrorists (see Chapter 5, Section 5.11.2, Overpopulation, Desertification and Instability, Nigeria and Section 5.11.4, Darfur, Sudan, overpopulation, desertification, ethnicity, conflict and politics);
- The countries struggle to satisfy a generation of restless young men. With some education, but little or no employment, it is radical Islam which offers them a purpose (Blunt 2004);
- Nigeria and Mauritania being among nations that have al-Qaeda cells (Knickmeyer, 2004);
- A key regional terrorist group U.S. officials are concerned about is the “Salafist (Salifist) Group for Preaching and Combat” which is suspected

in kidnapping European tourists traveling in the Sahara Desert in 2003 (Belida, 2004b) and with suspected links to al-Qaeda, is believed to have spread across borders into Niger and Mali (Knickmeyer, 2004). It is now called the Organization of al-Qaeda in Islamic Maghreb;

- Terrorism to the north could impact key oil and gas producers such as Algeria, and now Libya that appears to be coming under the fold of the West;
- There is a mass migration from the Sahel towards West Africa's coastal countries with projections of massive mega-cities. Already the conflict in the Ivory Coast is believed to be partially linked to the massive migrations of *Burkinabé* from the north, exasperating pressures on the economy and limited resource base to support a rapidly growing population, resulting in increased tensions and, today, anarchy from an ethnically and religiously (Muslim north and Christian south) divided country (see Chapter 5, Section 5.7.4.4, Land reform and civil war in the Ivory Coast);
- This migration has the potential to adversely impact the stability of a major oil producer such as Nigeria. A group of young men modeling themselves on the Taliban have recently battled with Nigerian police along the Niger border (Blunt, 2004);
- Niger is becoming important as a source of oil, has one of the world's largest deposits of uranium and other minerals; and
- Chad has become as major supplier of oil via a pipeline through Cameroon to the port of Kribi, all of which must be secured.

Some believe that U.S. military interventions in this region in the name of the “war on terror” are fueling the already existing unrest between Tuareg communities in Niger and Mali over benefits from natural resources and social concerns (Hennessy, 2007). Madsen (1999) believes these programs are a vehicle for extending U.S. military presence throughout Africa and to groom pro-U.S.

military leaders in Africa (Madsen, 1999; U.S. Department of Defense, 1999). France, South Africa, Egypt and Zimbabwe, as well as 50 traditional chiefs from ten West African states are skeptical, seeing this as a “thin end of an American wedge” to ensure Washington’s dominance over the continent’s natural resources. Is this not a form of indirect rule, no different than that practiced in the past by both the English and French (see Chapter 3, Section 3.1, COLONIAL STATE IN AFRICA) (Madsen, 1999). Madsen (1999) argues that

“Africa like other developing areas of the World has entered a new phase of neo-colonial U.S. military-corporate domination. With the end of the Cold War, Africa’s vast natural resources have been opened up to the most unscrupulous bidders and entrepreneurs. The United States, backed by a scavenging Britain and Canada seek to uproot French domination over much of the Continent. By 1998, the Americans and their allies had, for the most part, succeeded in replacing France as the dominant economic force on the Continent.

London was America’s handmaiden in this affair. This has been accomplished, ranging from Dakar, Senegal and Banjul, the Gambia in West Africa to Asmara, Eritrea and Djibouti to Kigali, as well as Rwanda in East/Central Africa by the United States, training and helping to place former soldiers and Marxist guerrillas (e.g., Yoweri Museveni of Uganda, Paul Kagame of Rwanda, Charles Taylor of Liberia; John Garang of Sudan, Eduardo dos Santos of Angola and Yayeh Jammeh of the Gambia) disguised as democrats on the thrones of neo-colonial governments controlled by the World Bank and IMF, whose policies are in turn controlled by the American government and financial institutions”.

For instance, six months after receiving military training in the U.S., 29-year-old Lieutenant Yayeh Jammeh led a coup *d’etat* against democratically elected Sir Dawda Jawara in 1994, while Paul Kagame led his military assault on Rwanda four months after similar training in the USA. In both cases, U.S. support was evident during these aggressions. Additional current and/or recent leaders who have “elected themselves” into the same offices that they shot themselves into,

include Museveni of Uganda, Pierre Buyoya of Burundi, Sani Abacha of Nigeria, Taylor of Liberia and Meles Zenawi of Ethiopia, just to name a few U.S. military assisted “new democracies” of Africa. At an Economic Community of West Africa States (ECOWAS), Nigeria’s Foreign Minister accused ACRI as being an imperialist maneuver to manipulate African armies in a neo-colonialist manner (Madsen, 1999). Is this the “pot calling the kettle black”?

13.8.2.4 Low operational U.S. military bases in Sub-Saharan Africa

“The United States military has access to a number of foreign air bases and ports in Africa and has established “bare-bones” facilities maintained by local troops in several locations...DOD refers to these facilities as ‘lily pads,’ or cooperative security locations, and currently has access to locations in Gabon, Kenya, Mali, Morocco, Sao Tome and Principe, Senegal, Tunisia, Uganda, and Zambia” (CRS, 2007).

The post-Cold War plans for U.S. basing in Africa and elsewhere is to create a web of austere forward operating bases, maintained normally only by small permanent support units, with the fighting forces deploying from the United States when necessary or, if at all possible, to use soldiers from surrounding African countries as proxy fighters with small contingents of U.S. elite special operations forces providing training and technical support. This “family of bases” can go “from cold to warm to hot if you need them”, and can be efficiently built without replicating the “small town USA” of schools and families that have previously accompanied such installations (Robinson, 2003), as in Europe.

These semi-permanent bases might accommodate a brigade of up to 3,000 to 5,000, with an airfield nearby. Up to a dozen of these bases are being considered in Africa. Forward operating locations are being planned, where small infantry or Special Forces units could be landed and built up as the mission requires. Carrier

strike groups and marine expeditionary units will patrol the African coast (Robinson, 2003).

Prospective U.S. base locations include Senegal, Mali, Sao Tome, Algeria, Morocco, Tunisia, Mali, Ghana and Kenya. The major problem will be making sure the economic and security benefits brought by the bases contribute to improving the lives of African people and not corrupt dictators (Robinson, 2003). While both Botswana and Liberia have offered to host an AFRICOM (U.S. military command for Africa) base, strategic partners Algeria and South Africa are reluctant “possibly out of concern over a permanent foreign military presence within their borders” (CRS, 2007).

East Africa and Horn of Africa

Examples of such bases include the use of existing bases in African countries, such as the port of Mombassa, Kenya, as well as airfields at Embakasi and Nanyuki, Kenya were used during the Somali intervention in 1992-1994 (Kagan, 2003; Volman, 2003). An Aircraft refuelling agreement has been arranged with Uganda (Schmidt & Copnall, 2003). The Pentagon arranged to establish the headquarters for the Combined Joint Task Force-Horn of Africa - CJTF (its regional counter-terrorism command center) in Djibouti (Kagan, 2003; Volman, 2003). Along with the headquarters element, 800 U.S. Special Forces troops have set up base at Camp Lemonier outside the city of Djibouti and the amphibious assault ship U.S.S. Mount Whitney, with 600 marines on board, is stationed off shore. In December 2002, 2,400 marines from the 24th Marine Expeditionary Unit, based on ships off shore, conducted military exercises in Djibouti in preparation for the impending war with Iraq (Kagan, 2003; Volman, 2003). The CJTF involves national forces from Kenya, Somalia, Ethiopia, Sudan and Yemen with the aim of detecting, disrupting, and defeating transnational terrorism

(Mbogo, 2004). This seems to fit in with the American policy of using other country's troops, with minimal on-the-ground presence by American troops, already spread thin because of Iraq and Afghanistan (Carafano & Gardiner, 2004).

The use of proxy armies and U.S. military adventurism in Africa continues. In late 2006, Ethiopian military forces invaded Somalia, eventually taking the capitol, Mogadishu, and kicking out the Islamic Court movement in early 2007. The U.S. State Department supported this invasion stating that Ethiopia has "genuine security concerns" from Islamist forces in its eastern neighbor (Gedda, 2006). The Islamic Court movement was brought to power as an alternative to the hated and despised U.S. supported warlords who bribed and terrorized ordinary Somalis (McCrummen, 2006). Although yet to be proven, in the belief that al-Qaeda elements were at large in Somalia, by the end of January 2007, AC-130 gunships were used twice to go after terrorist targets in Somalia. These gunships destroy every bit of life in an area and are not the weapons to use against an individual (Lesser, 2007). One must wonder how many innocent people may have been killed by such a blatant use of force. Somalia remains dangerous with more than 340,000 people fleeing the capitol between February and September 2007 as sporadic fighting continues. The U.S. supports the Somali President's call for a joint African-Arab peacekeeping force, as opposed to an African Union force that is deploying too slowly, to replace the Ethiopian military (Wadhams, 2007a). On the other hand, the Bush Administration is in direct opposition to the U.S. Congress, whose Ethiopia Democracy and Accountability Act would withhold non-humanitarian funds to Ethiopia until democracy and respect for human rights are fully restored (Robinson, 2007).

Botswana, Southern Africa

Madsen (1999) provided evidence that as far back as 1994, the U.S. constructed the Mapharangwane military airbase with a 1,000 foot runway, military barracks, a hospital and empty buildings 89 km (55 miles) northwest of Gaborone, Botswana. The capacity was much larger than what Botswana's current air force needed. It is believed that the purpose of this base is to serve the U.S. in southern Africa on an as-needed basis.

West Africa

"Security is a key obstacle facing the United States in its quest for West African oil. Africans are familiar with the problem. Oil revenues are an attractive prize. Nigeria recently announced that it had foiled a coup plot. Equatorial Guinea's leaders said they were targeted for an attempted overthrow by a group of mercenaries. The leader of Sao Tome and Principe was briefly deposed last year. The United States has stepped up its training of African militaries, partly to help with peacekeeping and to fight terrorism, but also to help secure its oil interests. Charles Snyder, Acting U.S. Assistant Secretary of State for Africa: 'we need to revive, and we will revive, the old African coastal security program, which helps African security forces to protect their shores, as well as their marine resources. And as I pointed out earlier, a lot of this new oil is actually off-shore. There is no one to protect it, unless we build up African coastal fleets' " (Shiner, 2004a).

In West Africa since 9/11, the nature of American military involvement in the vast Saharan expanse of north-west Africa, especially in Algeria, is finally taking shape. In 2003, President George W. Bush gave orders for a massive expansion of U.S. military presence in Africa (Schmidt & Copnall, 2003). The United States has a network of global commands to direct counter-terrorism operations on every continent, except Africa. More than 75% (3/4s) of the countries in Sub-Saharan Africa are managed as a side operation by the U.S. European command, a vestige

of both the continent's colonial legacy and the Cold War. Military strategists, Carafano and Gardiner (2004) recommend the creation of a Sub-Saharan Africa Sub-Command under Central Command whose responsibility already covers the Middle East, Central Asia and the Horn of Africa, since the European Command has paid little attention to Africa.

An Aircraft refuelling agreement has been arranged with Senegal, while the main focus will be on the Maghreb and bordering Sub-Saharan African countries. U.S. army bases are being planned in Algeria and Mali, which U.S. forces could use for training or for strikes on terrorist targets (Schmidt & Copnall, 2003). The construction by the Halliburton subsidiary, Kellogg, Brown and Root, that is billed as a NASA base (believed by locals to be doubling as a U.S. military/CIA listening post) alongside the main airport of Algeria's southern garrison and administrative capital of Tamanrasset, has been in progress for about a year (Barth, 2003).

In early 2004, an anti-terror team accompanied by Deputy Undersecretary of State for Africa, Pamela Bridgewater, arrived in Mauritania to discuss collaboration in the "war against terror" (Blunt, 2004). By February 2004, visits were made by the U.S. commander in Europe, Marine General James L. Jones, to Morocco, Cameroon, Nigeria and South Africa. European Command deputy head Air Force, General Charles Wald, is also traveling to Algeria, Nigeria and South Africa, as well as oil-rich Gabon. The European Command's director of planning, U.S. Air Force Major General Jeffrey Kohler, is visiting Mauritania, Mali and Niger (Belida, 2004a; Knickmeyer, 2004) due to the "the vital importance" of Africa to the overall international security environment committing the U.S. Defense Department to "robust engagement", including military-to-military exchanges intended to enhance cooperation, especially in the global war on terrorism (Belida, 2004a).

Sao Tome and Principe, Gulf of Guinea

Projected to provide 25% of America's oil by 2015 (GPF, 2002; CRS, 2007),

"estimates place potential reserves in the Gulf of Guinea at between 20 billion and 30 billion barrels. Although this pales in comparison to Saudi Arabia's proven oil reserves of 264.2 billion barrels, it still represents the largest single bloc of crude deposits in Sub-Saharan Africa and is well situated in the South Atlantic to supply oil to the United States and Europe" (GPF, 2002).

This then provides another port of entry by the American military to defend its oil interests in the Gulf of Guinea.

There has also been talk of extending the runway in Sao Tome, where the U.S. has major oil interests (Madsen, 1999). BBC (2002), Gary and Karl (2003) and AP (2004) reported that the U.S. Government was considering the construction of a deep water port, some said as a naval base in Sao Tome, as recommended to the U.S. Congress by African Oil Policy Initiative Group (AOPIG, 2002). US\$ 800,000 is being allocated to study the possibility of an airport (AP, 2004), while Reuters (2004) states that the money is being divided between studies of the port and airport. According to the U.S. Trade and Development Agency – USTDA (2004), the grant will be divided into US\$ 450,000 to study the feasibility of a deepwater port and US\$ 350,000 to study the expansion of the airport to make Sao Tome and Principe more accessible for trade and travel.

"According to the London-based *Financial Times*, an Israeli lobby group, the Institute for Advance Strategic and Political Studies, has called for the creation of a U.S. Gulf of Guinea Command, with Sao Tome serving as the naval base" (GPF, 2002).

"U.S. officials denied reports they were planning to establish a naval or military base at Sao Tome, but said the archipelago's location -- 300 km (190 miles) off the coast of Africa and lying

between unstable oil giants Nigeria and Angola -- was of strategic importance. ‘Certainly the U.S. Government recognizes the newfound economic interests in the region and we want to ensure Sao Tome is able to develop them without any undue pressure from other organizations in the region,’ a U.S. defense official said. ‘From a military point of view, Sao Tome is a strategic location for access to the rest of West Africa’ ” (Reuters, 2004).

Thus “America’s policy has changed from defending Africa from communism to preparing it for American investment and exploitation” (Madsen, 1999) and fighting terrorism, often induced by the way it deals with the rest of the world. Cindy Shiner of the Voice of America spells it out very simply,

“But now the United States is engaged in its own version of a scramble for Africa. West Africa – once considered of little importance to U.S. strategic thinking -- is attracting keen attention because of its deep-water resources of petroleum. The key to U.S. energy security lies in the diversity of its supplies. Africa is central to that diversity. Charles Snyder, Acting U.S. Assistant Secretary of State for African Affairs, spoke recently in Washington about rising U.S. national security interests in Africa...” (Shiner, 2004a).

In February 2007, President Bush announced the formation of AFRICOM, a U.S. military command for Africa to be fully operational by September 2008 (Butty, 2007a; Melton, 2007a):

“to coordinate U.S. military activities for almost all of the African continent (except Egypt)...formerly been divided up among U.S. Central Command in the U.S. state of Florida, U.S. Pacific Command in the Pacific island state of Hawaii, and U.S. European Command, located in Germany” (Melton, 2007a).

It will

“coordinate military activities as well as help with humanitarian aid operations conducted by U.S. government agencies such as the State Department and USAID”,

as well as train African peacekeeping forces (Melton, 2007a). According to Theresa Whelan, deputy assistant defense secretary for Africa,

“ ‘The purpose of this command is to help promote greater security, cooperation, and dialogue between ourselves and our African partners. That’s the intent. To build capacity within Africa for security because security is the framework, the foundation, of stability required for economic development, social development. So this isn’t about chasing terrorists around Africa’ ” (Melton, 2007a).

Regardless of the rhetoric, there is some concern that this will be perceived as a hegemonic attempt by the U.S. to create a united continental African military force under its control to fight terrorism and/or control China’s access to the continent’s vast resources (Butty, 2007a). The NGO, Africa Action (2003) is concerned that

“U.S. security cooperation with Africa has taken on new meaning since 9/11. Increased U.S. interest in projecting military force into the Persian Gulf has led to a massive increase in the U.S. military presence in the Horn of Africa. Meanwhile, U.S. concern with West Africa as an alternative oil source has raised the prospect of a U.S. base on the island nation of São Tomé. These recent developments indicate a return to a U.S. policy that treats Africa in purely geo-strategic terms, and seeks to form alliances with African governments according to their value in the framework of the U.S.’s ‘war on terrorism.’ It is critically important that the U.S. relationship with Africa not return to this dangerous Cold War model. A U.S. commitment to promoting peace and stability in Africa can do much to enhance international security”.

Navy Rear Admiral Bob Moeller, helping to arrange AFRICOM explained, “ ‘There is clearly an energy component...Overall, Africa is growing in global strategic importance’ ” with Africa’s security becoming a national security issue for the United States (Harris, 2007).

Given the above, it may be irrelevant what anyone or country thinks. Africa has literally been cordoned fenced in razor wire by the American military-industrial complex. This includes both military bases strategically located around the continent, as well as U.S. militarily trained armies and leaders. One could argue that resource rich Africa has been annexed as America's new colony in such a shrewd and clandestine manner that it is not evident to the naked eye, as proxies in the form of Africans are taking the lead while American troops lay in the background providing training, decision-support and direction. This has been the Islamists fear all along and one of the driving forces behind their terrorist activities that

“it has become clear that the American plan in Africa is aimed at establishing an American belt to succeed the Islamic belt” (Bodansky, 2001).

13.8.2.5 French American Economic Rivalries Bridge Africa and the Middle-East

The American onslaught of the African continent over traditional French domains can help explain the friction between America and France over Iraq, as America muscles in to take control of this country's economy. The Boer War historian Thomas Pakenham, author of *The scramble for Africa: The white man's conquest of the dark continent from 1876 to 1912* (Pakenham, 1991) has likened the 1899-1902 Anglo-Boer conflict with what is currently raging in Iraq, where today and then, France was a key player (News 24, 2004):

“ ‘I precipitated the crisis, which was inevitable, before it was too late...It is not very agreeable, and in many eyes, not very credible piece of business to have been largely instrumental in bringing about a big war’ (Sir Alfred Milner, British High Commissioner to Lord Roberts, June 6, 1900 *In: Packenham, 1991*).

- France had major economic interests in both wars and in both cases, was pushed out by an Anglophone country, Britain in the Anglo-Boer War and the U.S. in Iraq;
- Both wars were avoidable. Neither war was forced on Britain or the United States;
- Victorian authorities argued that late 19th century arms imports (French artillery and German rifles) were making the Boers stronger - a threat to the subcontinent (for the imperialist British), while Bush argued sanctions were failing and that Saddam Hussein would soon regain weapons of mass destruction with which to threaten his neighbors;
- Both wars also involved strategically important resources, oil in the case of Iraq and the Victorian equivalent, gold, in South Africa. At the time the Zuid Afrikaanse Republiek (ZAR) was the world's largest single supplier of gold to states that had just gone onto the gold standard, while Iraq had oil reserves second only to Saudi Arabia. In each case we have a superpower saying 'here is a strategically important resource we need to control. If we can't have it we will have to grab it;'
- The British then and the Americans in 2003 also convinced themselves that they were not occupiers, but liberators, liberating the Boer and *Uitlander* (British immigrants to the Rand gold fields refused equal rights and the right to vote in the Transvaal Republic after they had lived there for five years) from the iron heel of Paul Kruger, and Iraqis from the iron heel of Saddam Hussein; and
- They also convinced themselves it would be a short, sharp war and that once they had occupied Pretoria and Baghdad their new subjects would acquiesce. Neither foresaw the guerrilla war that came instead of the expected victory (News 24, 2004).

Already Halliburton, U.S. Vice-President Dick Cheney's former company and a score of other American companies, have been given major contracts in Iraq's oil industry.⁵²⁹ Prior to America's take over of Iraq, France controlled over 22.5% of Iraq's imports. French total trade with Iraq under the oil-for-food program was the third largest, totaling US\$ 3.1 billion since 1996, according to the United Nations. In 2001, France became Iraq's largest European trading partner. Roughly, 60 French companies did an estimated US\$ 1.5 billion in trade with Baghdad in 2001 under the UN oil-for-food program. France's largest oil company, Total Fina Elf, had negotiated extensive oil contracts to develop the Majnoon and Nahr Umar oil fields in southern Iraq. Both the Majnoon and Nahr Umar fields are estimated to contain as much as 25% of the country's oil reserves. The two fields purportedly contain an estimated 26 billion barrels of oil. In 2002, the non-war price per barrel of oil was US\$ 25. Based on that average, these two fields have the potential to provide a gross return near US\$ 650 billion. France's Alcatel company, a major telecom firm, was negotiating a US\$ 76 million contract to rehabilitate Iraq's telephone system. In 2001, French carmaker Renault SA, sold US\$ 75 million worth of farming equipment to Iraq. The top three suppliers of weapons from 1981 to 2001 were Russia, China and France, respectively (Satterlee, 2003).

13.8.3 France's Reaction to U.S. Incursions into Africa

France's reaction to this American onslaught in Africa was to take a proactive role in normalizing relations with Africa and in expanding their sphere of influence beyond their former colonies into countries (Huliaris, 2002 *In: Zack-Williams, et al., 2002*) such as Zimbabwe and South Africa. In 1998, Chirac visited Namibia, South Africa, Mozambique and Angola. Today, non-Francophone countries in Africa account for more than 50% of France's financial

⁵²⁹ U.S. led invasion of Iraq on March 2003. By December 2004, Halliburton Iraq contracts exceeded US\$ 10 billion (Waxman, 2004).

exchanges with Africa. In Angola, Elf accounts for 20% of the 700,000 barrels/day of oil production (Graham, 1998 *In:* Huliaris, 2002 *In:* Zack-Williams, *et al.*, 2002). There has been friction between Portugal and France, when Senegalese and Guinean troops invaded Guinea-Bissau to restore order after a coup *d'etat* in 1998. France had a fall out with South Africa over the idea of French spheres of influence in Francophone Africa and South Africa over southern Africa, the principle of *complementarité*. Even so, South Africa remains on friendly terms, being France's largest Sub-Saharan African market, while France is the 6th largest investor in South Africa (Mills, 1998 *In:* Huliaris, 2002 *In:* Zack-Williams, *et al.*, 2002).

However, France's sphere of influence over Africa was hampered by a series of policies that hurt relations. In some cases, this looks like smoke and mirrors, with France continuing to maintain considerable influence (Huliaris, 2002 *In:* Zack-Williams, *et al.*, 2002):

- A tough anti-immigration policy, feeling that immigration destroys national culture and globalization takes away jobs. France already had a large fluid North African and Francophone African population, with many countries' economies heavily dependent on remittances from sons and daughters living and working in France (e.g., the Senegal River Basin in West Africa). This anti-immigration sentiment will likely increase after the 2005 riots across France in and around the *bidonvilles* (slums) by North and Sub-Saharan African immigrants.
- The 50% devaluation of the West/Central African CFA currency from 50 CFA/1 FF to 100/1 in 1994, something that had stood since 1948 and had subsidized consumer imports of Francophone Africa's political elite.
- Reduction in foreign assistance in the 1990s.

- Radical reform of the French military in 1996, resulting in the closure of the military base in the Central African Republic, the pull-out of troops in Gabon and Chad, a reduction of French troops in Djibouti from 3,200 to 2,600 and a reduction in military advisors with the creation of an “African Peace Keeping Force” to take its place – though France finds itself embroiled in the Cote d’Ivoire in 2003/4 (part of *La Force d’Action Rapide*) – a 44,500 rapid deployment group for Africa based in France. The African peace keeping force with a mandate from the UN is staffed by French advisors and is seen as an extension of French power in Africa.

It is also believed in some cases that internal disagreement within the French administration over its foreign policy hampered prompt reaction. For instance, when Mobutu Sese Seko was ready to fall in Zaire (the Democratic Republic of Congo), one of his closest allies (France) would not commit itself to directly intervene, unwilling to bear the risks and costs of a potentially disastrous operation. France’s internal security services, *Direction la Surveillance du Territoire* (DST) and *Direction Générale de la Sécurité Extérieure* (DGSE), were not only bitter rivals on foreign policy, but disagreed over the use of mercenaries to back Mabutu back in 1996/7, with DST backing the use of mercenaries (Pech, 2000 In: Musah & Fayemi, 2000). As will be seen in Section 13.8.6.9 (The French connection), France used the Hutu as a proxy in an attempt to stop America’s proxies - Rwanda and Uganda – from moving in and overthrowing Mobutu Sese Seko and taking the Democratic Republic of Congo (Zaire).

President Jacques Chirac⁵³⁰ took it upon himself, against current government policy, to run an African strategy out of the Elysee Palace (the President’s office), since he had lost influence over domestic policy due to a divided government, resulting in cohabitation with Lionel Jospin of the Socialist Party as prime

⁵³⁰ There is a saying in Cameroon that “the Francophone African country presidents are students of President Jacques Chirac of France and President Paul Biya of Cameroon is his best student”.

minister. The Franco-African summits that began in the 1970s with only Francophone countries, by 1998 included almost all of Africa's leaders in an attempt to expand its sphere of influence on the continent. This included the invitation of President Robert Mugabe of Zimbabwe, considered a pariah by the West with imposed travel bans, frozen accounts and exclusion from the Commonwealth, being invited to the February 2003 Franco-African Summit in Paris. The Elysée, rather than the government, had regained a strong foothold in Africa. Similar to America's ACRI, since 1977 France has been training and arming African armies under the name Reinforcement of African Capacity to Maintain Peace (RECAM), now expanded into non-Francophone countries and, like ACRI, under the guise of the UN in the name of training African Peace Keeping Forces (Nabakwe, 2002).

France is obliged to continue these relationships out of concern for (Huliaris, 2002 *In: Zack-Williams, et al.*, 2002):

- 1) Maintenance of *la francophonie*, the cultural and linguistic identity on the African continent;
- 2) Mediterranean security and concern over terrorism linked to Islam and conflicts in the south (e.g., between Egypt and Sudan, Libya and Chad, Mauritania and Senegal, Morocco and Algeria over the Western Sahara, and the Tuareg issue in Algeria), forcing Paris to maintain relations with the Sahel;
- 3) More than 200 French companies and *Les expatriés* doing business with the continent, (one reason why France was obliged to send troops into the Ivory Coast to protect the French stronghold of Abidjan and to evacuate French citizens up-country); and

- 4) Africa also providing strategic raw materials to France, necessary to maintain its economy (e.g., oil in Gabon) (Smith & Glaser, 1992 *In: Huliaris* 2002 *In: Zack-Williams, et al.*, 2002).

La Voie Francaise (French Channel or Road into Africa) in the era of globalization will remain important in helping to assure France's significant engagement in African affairs (Huliaris, 2002 *In: Zack-Williams, et al.*, 2002) against the onslaught of the Americans, but at what cost to Africa and Africa's people, as these two superpowers vie for Africa's wealth?

13.8.4 South Africa's Reaction

Although, the economic war for Africa's resources is most visible between the Americans and the French, one cannot ignore the role of Africa's lone superpower in this battle. South Africa is the continent's economic powerhouse. While South Africa represents only 3% of the continent's surface area, it accounts for 40% of all industrial output, 25% of the GDP, more than 50% of electricity generated and 45% of mineral production (Wadula, 2005). In 1984, South Africa's global share in the production of ores included iron (43.4%), zinc (38.7%), manganese (50.3%), chromium (83.7%), rutile (38.1%), vanadium (100%), antimony (85.4%), silver (40.2%), uranium (44.4%), gold (96.1%), magnesite (60.4%) and iron pyrite (52.1%) (Alemayehu, 2000). Many European (e.g., Bayer, Daimler Chrysler, BMW,⁵³¹ Volkswagen), American (e.g., Johnson and Johnson, General Motors) and Japanese (e.g., Toyota, Nissan), as well as multi-nationals (e.g., De Beers, Anglo-American), have major corporate investments based out of South Africa. South Africa is highly urbanized and industrialized with most of the technological tools available to the West. It is also the last country on the subcontinent that can feed itself, as well as a large portion of southern Africa.

⁵³¹ Bavarian Engine Manufacturing/*Bayrische Motoren Werke* (BMW).

Additionally, South Africa may be one of the only global superpowers that have a vested interest in seeing the rest of the subcontinent develop in order to stop the tremendous inflow of illegal aliens. South Africa need take a back seat to no one.

South Africa saw these American programs as an attempt to dictate to Africa and themselves as a regional leader. Nelson Mandela rejected ACRI, saying,

“ ‘A force which is intended to deal with problems in Africa must not be commanded by somebody outside this continent. I would certainly not put my troops under somebody who does not come from Africa’ ” (Madsen, 1999).

Led by South Africa, the South African Development Community (SADC) is pushing for a unified stance against AFRICOM. The feeling is that AFRICOM, in looking out for American interests, could push African countries into conflicts that are not their own, or turn them into spectators on their own continent. The feeling is that Sub-Saharan Africa’s developmental needs include overcoming poverty and turning failed states into functioning ones, issues that military forces can do little about, especially foreign forces (Barber, 2007a).

South Africa realizes that this is no longer an ideological, but an economic war, which threatens their share of dominance on the continent. The “randlords” and a newly emerging black entrepreneurial class of South Africans are calling the shots in post-Apartheid South Africa. Multiracial South Africa would abide by its old Afrikaner tradition of providing arms to anyone willing to pay the price and use its influence, as in the Democratic Republic of Congo to push out the Americans in favor of its own multi-nationals (Madsen, 1999) (see Section 13.10.3.4, Corporate wars). South African firms, such as Executive Outcomes (EO) (mercenary), GMR (arms dealer) and Yurand Air (gun running air service), have been implicated from Angola to Congo Brazzaville, the Democratic republic of Congo and the Ivory Coast in military training and arms sales. When a 1997

cabinet order forbid private companies from providing military services without government approval, Executive Outcomes officially ceased operations, but its parent offices in Pretoria, Strategic Resources Corporation, continued to operate a world-wide network of firms, including Lifeguard,⁵³² Saracen⁵³³ and Sandline (Madsen, 1999). The “second scramble for Africa” was on and as throughout history, “all’s fair in love and war”.

13.8.5 China in the Back Door

Though this book will not go into great detail, while France and the USA vie for control of the Congo Basin, China may be slipping in the back door in its penetration of Sub-Saharan Africa, which has become geopolitically important to the future growth of this emerging economic and military superpower. Over the last ten years, there has been an important penetration of China into the subcontinent. The U.S.-based Council on Foreign Relations published a report in December 2005 entitled “More Than Humanitarianism: A Strategic U.S. Approach Towards Africa” indicating

“ ‘that Africa is becoming steadily more central to the United States and the rest of the world in ways which transcend humanitarian interests,’ ” raising concern that “ ‘all across Africa today, China is acquiring control of natural resource assets, out-bidding Western contractors on major infrastructure projects, and providing soft loans and other incentives to bolster its competitive advantage’ ” (Sorbara, 2006).

“(China’s) Involvement in the region is expected to expand after the launch in 2005 of the New Asian/African Strategic Partnership. The program has been set up to improve trade and investment opportunities between the Southern African region and Asian countries...One of the leading countries which is expected to profit from this new arrangement is South Africa. Overall trade and

⁵³² Address not found.

⁵³³ Address not found.

bilateral investments between China and South Africa remain minimal, yet the latter's technology in the energy sector and Sasol's strong refining and gasification infrastructure will be vital to China's future development. In terms of technological expertise, China is looking at South African coal liquefaction methods which seek to form oil from coal...The state-owned China National Petroleum Corp. (CNPC) is currently developing oil projects in Chad, which has diplomatic ties with Taiwan. Chinese oil companies are also signing contracts in West Africa's other key oil producers, such as Nigeria, Equatorial-Guinea, Congo Brazzaville and Gabon. Other countries like Ivory Coast, Mauritania and Niger have also been identified as future areas for cooperation by Beijing...Trade between Africa and China has increased by nearly 50% this year compared to 2003, which is significantly greater than the growth in Chinese trade with any other area in the world over the same period. The London-based Africa Confidential newsletter recently published fears that doing business with China will make African governments more corrupt. China is paying with large sums of advanced credit or loans for infrastructure development, making it more difficult to ensure that oil revenues benefit the people of the countries that produce the oil" (Widdershoven, 2004).

Hilsum (2005) raises similar concerns about China being seen by Sub-Saharan African countries as an alternative to G-8 countries, since corruption and good governance are a non-issue. The danger is that countries auction off their vast resources today (see Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife - Impacts of Land Reform on Wildlife and the Environment & Section 13.10.1.4, Petroleum war, Congo Brazzaville), much of this money being diverted into overseas bank accounts by elite, leaving nothing for future development. Junger (2007) raises similar concerns about oil-rich African countries taking Chinese loans today secured by future oil revenues with much of this money returning to China, as with Western foreign aid, through Chinese construction and exploration companies. By the end of 2005, China will overtake Britain as Africa's third largest trading partner (Hilsum, 2005).

“Trade between China and Africa has quadrupled since the beginning of this decade. China is now Africa’s third largest commercial partner after the US and France, and second largest exporter to Africa after France...Like the former colonial countries China backs its trading relations with aid, debt relief, scholarships, training and the provision of specialists...China is now making strategic trade deals throughout Africa. It gets copper from Zambia, cobalt and copper from the Democratic Republic of Congo, timber and oil from Congo Brazzaville, iron-ore from South Africa, and food from Tanzania, to name but a few. It is now the world’s largest consumer of copper, ahead of the US, and the worldwide rise in many commodity prices is largely driven by Chinese demand...Like the US, China is looking to diversify its oil supplies away from the Middle East and now gets between 25 percent and 30 percent of its oil from Africa, mainly from Sudan, Angola and Congo Brazzaville...The US Department of Energy has registered concern over China’s willingness to deal with regimes to which it has given pariah status” (Smith, 2006).

In early 2006, China issued its “African Policy Paper” that outlines its plans for the continent, with the “one China principle” (not recognizing Taiwan) being at the basis of this relationship, along with the policy of mutual economic self-interest, especially access to vital natural resources to drive its ever-growing economy. Where the West sees poverty and despair, China sees opportunity. In addition to trade and investment relations, like the West, it involves military training and defense. It is also investing in sectors that Western aid agencies and private investors have long neglected, including physical infrastructure, industry and agriculture (Sorbara, 2006).

Large numbers of Chinese are studying at South African universities, and one can be assured they have come for business purposes, not for sunshine. For instance, in 2006 out of 48,597 students, there are 113 students from Asian countries, just about all Chinese and only two North Americans, both from the United States, attending Tshwane University of Technology, South Africa (SMS, 2006). China

“recently agreed to bring some 10,000 African students to China on scholarships” (Leggett, 2005). Johannesburg, South Africa and Windhoek, Namibia already have “China Towns”, while every small town in Namibia has a Chinese shop, as do many of the shopping centers in South Africa.

“In oil-rich Nigeria, China is rebuilding the railroad network. In Rwanda, Chinese companies have paved more than 80% of the main roads. In more than a dozen African countries, Chinese firms are searching for oil and gas and rebuilding electricity grids and telephone networks. Chinese companies own one of Zambia's largest copper mines and run a major timber operation in Equatorial Guinea. In tiny Lesotho, Chinese businessmen own and operate nearly half of all the supermarkets and a handful of textile companies” (Leggett, 2005).

Nearly 700 Chinese companies operate in 49 African countries; Chinese trade with Africa projected to reach US\$ 30 billion by 2006 - triple the level five years ago (Smith, 2006). The U.N. estimates that annual trade by Chinese companies with 48 African countries has grown fivefold since 2000 to US\$ 56 billion. In South Africa alone Chinese imports increased from US\$ 2.4 billion in 2003 to US\$ 6.7 billion in 2006 (Hill, 2007). In fact, much of Africa's 5.5% economic growth in 2006 is attributed to China's demand for its oil, natural gas, timber, copper and other natural resources (Harris, 2007). In the next five years, China-Africa trade is expected to surpass US\$ 100 billion (Sorbara, 2006; Junger, 2007), which in addition to resource extraction, includes everything from construction of fish processing plants in Namibia and Gabon, commercial farming in Zambia, Zimbabwe and Tanzania, a beach resort/casino, tractor factory and sugar plant in Sierra Leone, a Nigerian communications satellite, a textile factory in Zambia, investments in power stations, low cost housing projects, cassava plantations, an agro-research centre, an HIV/Aids medicine factory and a medical equipment factory in Nigeria (Sorbara, 2006) and arms to Sudan (Smith, 2006) among others.

However, much of China's interest in Sub-Saharan Africa is all about Africa's natural resources, especially oil (Goodman, 2004; Hilsum, 2005; Junger, 2007), but also timber and minerals (Hilsum, 2005; Smith, 2006). Under the regime of Charles Taylor, China bought tropical hardwoods, with the money being used to buy arms. In Gabon, China is buying up tropical hardwoods and prospecting for oil in a nature reserve (Junger, 2007). In the DRC, children work in Chinese-owned cobalt mines (Junger, 2007). China's 1.3 billion people make up 20% of the global population, with an economic growth greater than most First World countries at between 10%/year (Diamond, 2005) and 11%/year (Junger, 2007). With China's rapidly growing resource hungry economy, if its population reached First World standards this would approximately double the world's human use of natural resources (Diamond, 2005). With a declining domestic output at the largest of its domestic oil fields (Goodman, 2004), China is looking outside of its borders. Since 1993, and for the first time in its 5,000 year history, China is dependent on imported goods, such as oil, to drive its economy (Guo, 2002; EIA, 2004; Luft, 2004).

In 2003, for the first time, China has surpassed Japan as a global consumer of oil at 5.56 million barrels per day (mbd), second only to the U.S. By 2025, China's oil demand is projected to reach 12.8 mbd, with net imports of 9.4 mbd or 74% of its total demand being imported (EIA, 2004; Widdershoven, 2004). Guo (2002) estimates that "by aggressively exploring and developing fields, crude oil output in China is expected to reach 0.2 billion tons in 2020, meeting the 50% of the crude oil demand". China's oil imports have increased from 6% of its oil needs a decade ago to 33% in 2004 and projected to increase to 60% by 2020 (Goodman, 2004). China is projected to be the source of 40% of the world's oil demand growth over the next four years (EIA, 2004; Widdershoven, 2004). Likewise, China currently imports 45% of its iron ore and 44% of its requirements for ten nonferrous metals. It is the world's leading consumer of copper, using 20% of the

world's supply (Areddy, 2005). Sub-Saharan Africa is an obvious source of these resources.

"Since 2000, China's trade with Africa has nearly tripled to almost \$US 30 billion (23.1 million euros). In 2004, China spent almost \$US 10 billion on African oil, accounting for nearly 33% (one-third) of its total crude imports. That is twice as much as it imported from Saudi Arabia, traditionally one of Beijing's biggest suppliers" (Leggett, 2005).

China obtains 31% of its oil from Africa (Junger, 2007). China has become a key player in Sudan's oil (EIA, 2003; Goodman, 2004; Widdershoven, 2004). Leggett (2005) estimates that Sudan currently provides China with 5% of its oil imports, while Junger (2007) places this figure at 7%. Hilsum (2005) estimates that 60% of Sudan's oil goes to China with the potential to meet 9% of China's oil demand, "while Chinese companies are involved in nearly all new oil exploration, production and refinery projects" (Hilsum, 2005). Junger (2007) estimates 80% of Sudan's oil goes to China. The state-owned China National Petroleum Corporation (CNPC) owns 40% (the largest single share) of the Greater Nile Petroleum Operating Company, a consortium that includes Malaysian and Indian firms and Sudan's national company. The CNPC joined with Sudan's Energy ministry to build the country's largest oil refinery and in 2003, investing US\$ 300 million to double production. The consortium's Heglig and Unity oil fields produce 350,000 barrels/day. The CNPC owns part of a field in southern Darfur and 41% of a field in the Melut basin that is expected to produce 300,000 barrels/day by the end of 2006. China's Sinopec Corporation is building a pipeline from this complex to the Red Sea, where China's Petroleum Engineering Construction Group is building a tanker terminal (Goodman, 2004) (see Section 13.10.1.6, Oil-scorched earth Sudan). Chinese firms also have oil concessions in Kazakhstan, Peru, Azerbaijan, Venezuela, Iran and Iraq (Ahrari, 2003; EIA, 2004).

"West Africa, Libya, Sudan and even South Africa have become key areas that Beijing has targeted in its global crusade for crude oil, natural gas and even refining assets and petrochemical products...In 2001, around 25% of Angola's crude oil exports went to China" (Widdershoven, 2004). In Angola "China has become a major buyer and an increasingly active investor" (Leggett, 2005). In 2004, "China's export bank, Exim Bank, extended a \$US 2 billion line of credit to the Angolan government for infrastructure projects. In return for a low interest rate and a generous repayment schedule, Angola agreed to provide 10,000 barrels of oil a day and to award large construction contracts to Chinese firm" (Hilsum, 2005).

A new consortium, jointly controlled by the Angolan government-run Sonangol oil company and China's Sinopec, will build a 240,000 barrel per day refinery, while in 2006 Angola accounts for 13% of China's crude oil imports, making it the second largest consumer of Angolan crude oil after the United States. Meanwhile, 20 leading Chinese firms operate in Angola (Sorbara, 2006).

Of particular concern is China's willingness to use its seat on the UN Security Council to protect repressive regimes in Africa from economic sanctions (Sorbara, 2006). When Ethiopia went to war against neighboring Eritrea in the late 1990s, the U.S. responded by evacuating Peace Corps volunteers, scaling back military aid and issuing a security warning to U.S. citizens and companies, while China reacted in an opportunistic manner (Leggett, 2005).

"It dispatched even more diplomats, engineers, executives and teachers to Ethiopia. New aid grants soon rolled in, followed by bank credits for Chinese companies operating there. Today, China's influence in Ethiopia is overwhelming. Its embassy is among the largest in the country and hosts more high-level visits than any Western mission. Chinese companies have become a dominant force, building highways and bridges, power stations, mobile-phone networks, schools and pharmaceutical plants. More recently, they have begun exploring for oil and building at least one Ethiopian military installation" (Leggett, 2005).

China is also building the controversial 180 meter high Takazee Dam in Ethiopia on the Blue Nile that is soon to be completed (Leggett, 2005) (see Section 13.11, AFRICA'S POTENTIAL WATER WARS), while the China Exim Bank, along with various Arab funds, is financing the Merowe Dam along the Nile River, Sudan, with construction by Chinese and European companies, including Lahmeyer International,⁵³⁴ Alstom,⁵³⁵ and ABB.⁵³⁶ Local residents have protested, being displaced by this dam, and Bedouin pastoralists have been denied traditional access to the river. In April 2006, gross human rights violations occurred when the military fired on local people gathered at a school to discuss the dam, killing three and injuring 10-50 (some say 30 seriously) (IRN, 2006a; Sudan Tribune, 2006a). An estimated 70,000 people will have their lands submerged by the Merowe Dam (Hoebink, 2007).

Its Exim Bank will also provide a US\$ 2.3 billion loan to construct the M'panda Ncua hydroelectric dam, power station and 1,540 km of transmission lines between Tete and Maputo (AllAfrica, 2006; Macauhub, 2006) (see Chapter 7, Section 7.10.7.3, Kariba and Cahora Bassa Dams, Zambezi River).

⁵³⁴ Lahmeyer International GmbH, Friedberger Str.173, 61118 Bad Vilbel, Phone: +49 6101 55-0, Fax: +49 6101 55-2222, E-Mail: info@lahmeyer.de, <http://www.lahmeyer.de/>.

⁵³⁶ ABB Ltd, involved in power and automation technologies, Affolternstrasse 44, P.O. Box 8131, CH-8050 Zurich, Switzerland, Tel. +41 (0)43 317 7111, Fax +41 (0)43 317 4420, <http://www.abb.com/global>.

“It is all part of Beijing’s broad push into Africa. Aiming to secure access to the continent’s vast natural resources, China is forging deep economic, political and military ties with most of Africa’s 54 countries” (Leggett, 2005).

“State-run Chinese concern Sinopec, Total Gabon and the Gabonese government signed several agreements which guarantee China a steady flow of Gabonese oil” (Widdershoven, 2004).

While the U.S. and Britain impose sanctions on the Mugabe government in Zimbabwe, China has opened direct flights between the two countries (Leggett, 2005) and sold it US\$ 240 million in arms (Junger, 2007) (see Chapter 5, Section 5.7.4.1, Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife, Impacts of Land Reform on Wildlife and the Environment & Chapter 10, Section 10.4.6.4, Zimbabwe). China National Aero-Technology Import and Export Corporation (CATIC)

“recently signed a \$300 million contract to rebuild Zimbabwe’s electricity grid. It has a raft of other deals in the pipeline -- including possible military aircraft sales” (Leggett, 2005).

Yet, despite the developments listed above, analysts believe that the overall impact of Chinese companies in Africa will be limited because they do not have the financial power or technology to access the continent’s biggest oil fields, which are offshore.

‘A lot of the new oil that is being brought online is being developed in deep offshore waters and a lot of those fields are only capable of being exploited by western companies both because of their access to proprietary technology as well as the large amounts of financial capital that are needed to exploit those fields,’

stated Ian Gary, an oil specialist with U.S.-based aid group, Catholic Relief Services (Widdershoven, 2004). It is just this limited access to oil that some see as driving China to support brutal, corrupt, dictatorial regimes such as Sudan, Iran

and Burma. Some see this being driven by the West's dominance of the more easily accessible sources of oil, while controlling the technologies to obtain the harder to reach oil. Only 23% of the world's known oil reserves are open for ownership. When, China offered US\$ 1 billion for the American oil company UNOCAL, as a means of breaking into Western oil markets, there was such an uproar by the U.S. Congress that a lower bidder was accepted over China, accelerating China's African strategy. A long-term solution to Darfur may very well require a global energy strategy that allows China access to the world's oil wealth to meet its oil needs increasing at 10%/year, which it needs to drive its economic growth (Junger, 2007).

Chinese trade with Sub-Saharan Africa has also had a major adverse impact on the nascent textile industry in Southern Africa (see Section, 13.13.6.2, AGOA) and is based upon low wages, poor working conditions and poor environmental controls. In the DRC, children work in Chinese-owned cobalt mines (Junger, 2007). According to the World Bank, four of the 10 smoggiest cities on Earth are in China and an estimated 710,000 to 760,000 Chinese die each year due to toxic air and water (The Washington Post, 2007).

13.8.6 Former Cold War allies vying for power in the Great Lakes Region

“If there is one thing sure in this world, it is certainly that it will not happen a second time” (Primo Levi, 1958, Auschwitz Survivor *In: Gourevitch, 1998*).

13.8.6.1 Colonial origins of ethnicity in Rwanda

As discussed in Chapter 1, European biases of a superior white-in-origin race, the Tutsi, ruling over an inferior Bantu race, the Hutu, institutionalized and legitimized a growing cleavage between these socio-economic groups.

Traditionally, the lines between the cattle-owning aristocratic Tutsi or “market dominant minority” and the Hutu majority were permeable, both speaking the same language, inter-marrying and with economic mobility, where a successful Hutu could become a Tutsi. (Gourevitch, 1998; Chrétien, 2003; Chua 2003).

“There is now ample evidence of what has been called the ‘invention of ethnicity’ by which is meant the ways in which it was constructed and instrumentalized during the colonial period...the invention of modern ethnicity was coincidental in time with the imposition on the continent of the colonial political structure – itself modeled on the European state. So it was the colonial state which formalized the ethnic map and conspired to define the relationship between ethnicity and politics...What has happened since independence, has been the working through of the practical consequences of the colonial ‘politicization’ of invented ethnicities” (Chabal & Daloz, 1999).

Racial identity cards were issued based on physical characteristics (Gourevitch, 1998; Chrétien, 2003; Chua, 2003), which helped to cement any differences between Tutsi and Hutu, creating ethnic divides and eventually a brewing hatred that could only end in one way, destruction. Gourevitch, (1998) calls this a joint venture between the Belgian government and the Catholic Church to radically re-engineer Rwandan Society along so-called ethnic lines. They went so far as to send in scientists to take cranial, lip and nose measurements as a basis for issuing “ethnic identity cards”. The Tutsi were provided with a superior education and favored positions in government, while the Hutu served as a labor pool (Gourevitch, 1998; Chrétien, 2003).

“In pre-genocide Rwanda, development assistance reinforced ethnic tensions. Individual projects and programs have also caused trouble by reinforcing or exacerbating existing inequalities at local level” (Commission for Africa, 2005).

In the mid-1900s, average family revenues for both Rwandan Hutu and Tutsi were almost the same. Ethic obsession took hold in a small stratum of elite *evolués* educated by the European/Catholic Church complex, resulting in a majority-educated Tutsi elite (a minority of Rwanda's population) favored by French-speaking priests and a minority-educated Hutu counter-elite (making up the majority of Rwanda's population) favored by Flemish-speaking priests; maybe several thousand people (Madsen, 1999; Chrétien, 2003), this transition beginning in the late 1930s. Some called these elite the fourth ethnic group; Hutu, Tutsi, Batwa Pygmies and the educated elite minority. In 1957, with support from the White Fathers, a Catholic order, nine Hutu intellectuals from the seminary issued the "Manifesto of the Bahutu", raising the issue of the indigenous racial problem and the monopoly over access to the best education and leadership roles by Tutsi and denounced them as beneficiaries of "Hamitic domination". By 1958, Tutsi notables published documents attributing the founding of Rwanda to the Tutsi and denying any relationship to the Hutu. With independence around the corner, the Tutsi created the Rwandan National Union/*Union Nationale Rwandaise* (UNAR) and the Hutu Rwandan Democratic Rally (Assembly)/*Rassemblement Démocratique Rwandaise* (RADER). By 1959, ethnic-based slaughter occurred on both sides in the north and center of the country (Chrétien, 2003). Some 300 people died in the violence, known as the Muyaga Massacres, as these two ethnically divided parties vied for power. With the "Winds of Change" fueling the fire, the Belgians wanted out (Madsen, 1999).

13.8.6.2 Independence, control by an impoverished majority

Belgian paratroopers from the Congo moved in and Belgium reversed traditional Tutsi/Hutu relationships, which it helped formalize, "De-UNARizing" the country by replacing half the Tutsi chiefs and 300 of 500 sub-chiefs with Hutu, followed by communal elections giving the Hutu the majority. This was called a

“revolution under trusteeship” or an assisted one, with the ruling party Party of the Movement of Emancipation of the Bahutu /*Parti du Mouvement et de l’Emmancipation* Hutu (PARMEHUTU) being racist to the point that other Hutu parties denounced it in vain. PARMEHUTU claimed to restore Rwanda to its owners and invited the Tutsi to return to Abyssinia. The 1959-61 social revolution would shape Rwanda’s politics for the next three decades (Chrétien, 2003).

The 1960 elections, resulting in the Hutu winning 90% of the political posts, gave an impoverished majority political control over an economically powerful minority (Chabal & Daloz, 1999), which Chua (2003) has shown is a recipe for disaster (see Chapter 11, Section 11.6.3, Neo-Patrimonial Clientelism, The Big Man and “Cosmetic Democracy”) that was exasperated by scarce resources – land (see Chapter 5, Section 5.9.4.6, Deforestation in afromontane forests, Rwanda, Over-Population and Land Degradation Linked to Deforestation for Agriculture and Political Destabilization). At a stroke of the pen, the Tutsi monarch was deposed (Madsen, 1999). Dallaire (2003) places independence as 1962, run by a Hutu dominated government and the charismatic leader, Gregoire Kayibanda. In essence, Belgium reversed traditional relationships between these two groups along democratic Western principles where the majority rule. This failed, as rule was along ethnic as opposed to ideological lines, which tends to define party politics in Sub-Saharan Africa, where the majority of populations are uneducated and define their allegiances to extended family, ethnic group, village chief and king/marabou, with the spirit of nationalism and citizenry being far down the line (Chabal & Daloz, 1999).

The way forward of fitting Western ideals of democracy within these cultural differences must be found by the 21st century generation of educated Africans. As discussed, President Museveni of Uganda was the first to break the “Cookie

Cutter Mold” imposed on Africa of “One Man One Vote Multi-Party Elections”, which to date have proven less than successful in creating representative governments (see Chapter 11, Section 11.6.6.2, Uganda, democracy, civil war and attempts to find an African solution).

Tutsi were forced to flee by the politically dominant Hutu majority, which by the 1980s resulted in 700,000 refugees in Uganda, Zaire and Tanzania. By 1964, Tutsi manhunt massacres of up to 10,000 people were beginning. Leading Tutsi party politicians were executed and by 1966 the Party of the Movement of Emancipation of the Bahutu /*Parti du Mouvement et de l'Emmancipation Hutu* (PARMEHUTU) became the only party, with blessing from the Catholic hierarchy. Hutu suspected of being closely tied to Tutsi were considered as hybrids or those who had switched ethnic groups. Regional in-fighting within the Hutu political structure resulted in a 1973 coup *d'etat* moving the Hutu power from the center to the northern part of the country, putting in power General Habyarimana and eventually a new party of power, the National Revolutionary Movement for Development/*Mouvement Révolutionnaire National pour le Développement* (MRND) (Chrétien, 2003). Initially, this occurred at the height of the Cold War, with the West backing the Hutu, while the Tutsi refugees were backed by the communists (Gasana, 2002 In: Matthew, Halle & Switzer, 2002). Eventually, with the end of the Cold War, the French would back the Hutu and the Americans the Tutsi, only this time not for ideological reasons, but for wealth and greed – as usual at the expense of Africa and its people. Habyarimana’s Second Republic represented northern elite, but was rapidly undermined by numerous dualities: 1) Rural poverty, 2) The north/south divide, 3) The Hutu/Tutsi Divide and 4) Rich versus Poor. As an insurance policy, Habyarimana allied himself with Jacques Foccart, “Monsieur Afrique”, who pretty much determined France’s African policy from the 1960s through to the mid-1990s (Madsen, 1999). Habyarimana used gorilla conservation politically to obtain

Western financial and military aid, which, along with his being given conservation awards, led many Rwandans to believe that Westerners cared more about gorillas than the wellbeing of those being massacred nearby (Vande weghe, 2004) (see Chapter 3, Section 3.6.1, Separation of Maasai from Ngorongoro Crater and Chapter 11, Section 11.11.6.3, Failure to integrate Baka into managed bushmeat harvests).

Colonial-era-like social engineering began in which the Tutsi minority could occupy only 9% of the school and job positions, extending ethnic consciousness to new generations thereby creating an ethno-racial democracy. The Hamitic myth under which it was born, came out of colonialism (Chrétien, 2003), but was supported by foreign aid through Western donors. Habyarimana's corrupt totalitarian rule would last two decades, while the majority lived in poverty (Chua, 2003). Habyarimana was a master, using "development" to milk the European and American donors. By law, every citizen was a member of the party (Gourevitch, 1998).

13.8.6.3 Overpopulation and SAP impacting agriculture

Since 95% of Rwanda was under cultivation (see Chapter 5, Section 5.9.4.6, Deforestation in afromontane forests, Rwanda, Over-Population and Land Degradation Linked to Deforestation for Agriculture and Political Destabilization) and there was little room for expansion, Habyarimana declared Rwanda full, excluding the idea of Tutsi refugees being repatriated to their homeland (Gourevitch, 1998). By 1990, there was an estimated 174 persons/km² (450 inhabitants/mi²) (Rosenblum & Williamson, 1990). Gasana (2002, *In: Matthew, et al.*, 2002) estimated 290 inhabitants/km² territory and 843 inhabitants/km² of arable land in 1994. Habyarimana also alienated southern-based Hutu, favoring Hutu from his home in the northwestern section of the country (Gourevitch, 1998;

Gasana, 2002 *In: Matthew, et. al., 2002*). In a classical pattern of neo-paternalism, the omnipotent President and his cronies grew rich at the expense of both downtrodden Hutu and Tutsi. Every hill had its chief and, in descending order under the chief, deputies and sub-bosses in a classical patron-client relationship that kept Habyarimana in power, who became the chief of chiefs or *Mwami*. These northwesterners controlled the government parastatals, as well as the military. Rwanda appeared Edenic to foreign donors, the rest of the continent being covered by client dictators of the Cold War ruling by pillage and murder (Gourevitch, 1998).

“If you were a bureaucrat with a foreign-aid budget to unload, and your professional success was to be measured by your ability not to lie or gloss too much when you filed happy statistical reports at the end of each fiscal year, Rwanda was the ticket...The hills were thick with young whites working albeit unwittingly, for the glory of Habyarimana” (Gourevitch, 1998).

By 1986, Rwanda’s chief exports, coffee and tea, crashed on the world market (see Chapter 12, Section 12.2.5, ILO Demands an End to Subsidies and Trade Barriers), with the only easy profit left being scammed foreign-aid projects, with competition for the spoils among Habyarimana’s northwesterners being particularly intense. Sogge (2002) blames the crash in coffee prices (drop of -64% price between 1980 and 2000), that heightened or exacerbated ethnic tension, on USAID and the World Bank, who vigorously promoted coffee farming among poor smallholders, not only in Rwanda, but many other countries, until there was a glut on the world market. Structural adjustment austerity programs (SAP) added to the collapse of world prices for coffee and tea (Diamond, 2005). This impoverished tens of thousands of Rwandan farmers. Meanwhile, the International Finance Institutions (IFIs) praised both Rwanda and Burundi as good performers in free-market fundamentalism (SAP) right up until the genocide (Sogge, 2002). Madsen (1999) believes that the structural

adjustment program of the World Bank/IMF resulted in a return to famine, something not seen for 20 years, accentuating the hostility between Hutus and Tutsis that led to later acts of genocide.

By 1988, Western aid underwrote about 60% of Rwanda's annual budget (see Chapter 11, Section 11.6.7, Foreign Aid and Puppet Governments – “Donor Democracy”). The economic collapse of the late 1980s left tens of thousands of young men without any hope for work, ripe for recruitment into the Hutu *Interahamwe*, “those who attack together” (Gourevitch, 1998). These masses of disenfranchised, poor, under-educated and frustrated youth are a key component for much of the turbulence across Sub-Saharan Africa.

13.8.6.4 Franco-American competition begins, 1990

On October 1, 1990, several thousand Anglophone Tutsi soldiers from the Ugandan National Resistance Army (NRA), who formed the armed wing of the Tutsi dominated (with some Hutu) Rwandan Patriotic Front (RPF), with support from President Museveni of Uganda attacked northeast Rwanda. These Tutsi, comprising 20% of Museveni’s army, had helped Yoweri Museveni, a Hima, liberate Uganda from Milton Obote in 1986 (Gourevitch, 1998; Chrétien, 2003). Museveni was considered the linchpin in an Anglo-Saxon plot to seize control of Central Africa and its natural resources (Madsen, 1999). The RPF was against Tutsi backed Rwandan National Union/*Union Nationale Rwandaise* (UNAR)’s monarchist tradition and was supported by several key Hutu leaders who were disgusted by the corruption and nepotism of the Habyarimana regime. This initial incursion was put down by the Rwandese Armed Forces/*Forces Armées Rwandaises* (RAF/FAR) with backing by French, Belgian and Zairian contingents (Gourevitch, 1998; Chrétien, 2003) under *Operation Noiroit*, as the result of a 1975 defense pact signed between Habyarimana and the then-President Valery Giscard d’Estaing (Madsen, 1999).

This may have been the beginning of a period of defensive action in which France began aggressively maintaining its sphere of influence over its former French colonies and other Francophone countries from Anglophone influence, especially the Americans, who have provided strong backing to Museveni since he took power in 1986 and eventually Paul Kagame in Rwanda (Madsen, 1999). Paul Kagame of the Rwandan Patriotic Front (RPF) continued the guerilla war in the north with support from Uganda (Gourevitch, 1998; Chrétien, 2003). The Americans provided military training to the RPF (Madsen, 1999; O'Brien, 2000; Pech, 2000 both *In:* Musah & Fayemi, 2000) and Uganda (O'Brien, 2000 *In:* Musah & Fayemi, 2000), while France provided military training to Rwanda's Hutu army, a proxy war fought by Africans for control of natural resources in Central Africa by the superpowers (Madsen, 1999), these resources being mostly next door in the Democratic Republic of Congo. France funneled huge shipments of armaments to Rwanda right through the killings in 1994 (Gourevitch, 1998).

In desperation, by April 1992, Habyarimana was obliged to move towards a multi-party power sharing system with four opposition parties in creating a coalition government that would move towards a "democratic" transition. It is believed that this multi-party system was given birth in Habyarimana's attempt to retain control under tensions caused by environmental scarcities, war, ethnicity and regional factions. However, this resulted in a loss of state control and the rapid empowerment of radical factions, creating tri-polar politics of Habyarimana's party National Revolutionary Movement for Development/*Mouvement Révolutionnaire National pour le Développement* (MRND), opposition parties and the RPF, with undertones of landless rural youth whose membership was courted by various political parties (Gasana, 2002 *In:* Matthew, *et. al.*, 2002).

There was a total of four major incursions by the Rwandan Patriotic Front (RPF), each one pushing Internally Displaced Persons (IDPs), mainly Hutu further south, crowding them into already resource scarce areas, heightening the tension between rural people, while creating the beginning of ethnic hatred as Hutu were pushed off their land by a Rwandan Patriotic Front (RPF) comprised primarily of Tutsi (Gasana, 2002 *In: Matthew, et. al., 2002*):

- October-December, 1990, 30,000 inhabitants of Muvumba and Ngarama fled their homes;
- By end of 1991, it rose to 350,000 IDPs;
- By July 1992, 500,000 IDPs; and
- By February 1993 >1 million IDPs as RPF violates cease-fire and resumes war, followed by another 350,000 Hutu refugees coming out of Burundi after the assassination of President Ndadaye.

The war caused a major food crisis, both in local production and transport of food aid – an ecological and logistical disaster, resulting in the average available energy of 1,100 calories/person/day (Gasana, 2002 *In: Matthew, et. al., 2002*), about half the minimal daily requirement to subsist for an adult. In essence, by 1994 the war was causing 800,000 people to starve to death, while political elites struggled for power and control of state resources.

Habyarimana let it be known that political disorder would lead to interethnic violence. On the ground, there were no spontaneous reprisals against the Tutsi except for that which was politically orchestrated. As new opposition parties emerged and propaganda in the form of the “Hutu Ten Commandments” against the Tutsi cockroaches (*inyenzi*) and their Hutu accomplishments (*ibyitso*), bloodbaths began by 1992 linked to the Hutu *Interahamwe*, a militia of the National Revolutionary Movement for Development/*Mouvement Révolutionnaire National*

pour le Développement (MRND). The *Interahamwe* was largely made of landless, uneducated youth from IDP camps and urban poor, who had no real ideological commitment, but to serve those who paid them and fed them (Gasana, 2002 *In: Matthew, et. al.*, 2002) – in essence, young child soldiers – mercenaries for hire. The “Hutu Ten Commandments” included (Guest, 2004): 1) Hutu men should never marry or befriend Tutsi women, 2) Every Tutsi was a cheat and any Hutu doing business with a Tutsi was a traitor, 3) All strategic positions, including political, administrative, economic, military and security should be occupied by a Hutu and 4) Hutus must stop having mercy on the Tutsi. In 1993, the Tutsi RPF undertook reprisals, forcing one million people to flee the north towards Kigali.

The August 1993 Arusha peace accord with the RPF, provided the RPF with five key government portfolios out of 21, with the military split 60% Rwandese Armed Forces/*Forces Armées Rwandaises* (RAF/FAR) (mostly Hutu) and 40% RPF forces (mostly Tutsi), while command at all levels would be equally shared. This accord did not last for long, being broken before it could really be implemented (Gasana, 2002 *In: Matthew, et. al.*, 2002). By November 1993, the UN “Blue Hats” had arrived as peace keeping forces. However, a Tutsi-dominated army takeover of Burundi in October 1993, cost the lives of elected President Ndadaye and other Hutu officials and eventually, the lives of 100,000 people. The RPF looked too much like the Tutsi dominated army of Burundi (Chrétien, 2003).

13.8.6.5 Next door Burundi

On the contrary, in neighboring Burundi, initially at the time of independence, politics revolved around ideological differences of two princely Tutsi factions, one supporting Burundi remaining friendly to Belgium, the other supporting independence. “Racism” was not an issue. In fact, the party of independence, the

Party of National Unity and Progress/*Unité Pour le Progrès National* (UPRONA), was popular among Hutu, Tutsi, Muslim and Christian and had a majority membership made of Hutu. The United Nations supervised legislative elections in 1961 and handed control to UPRONA. Independence was declared on July 1, 1962, with the political class of educated elites splitting into two factions based on in which school they were educated. Elections in 1964 continued to give UPRONA a majority. However, with 67% (2/3rds) of parliament being Hutu, with the appointment of a Tutsi prime minister, the Hutu leader in collaboration with the gendarmerie, organized a coup *d'etat* in October 1965 and Tutsi massacres began, with reprisals on the Hutu political class from the Tutsi dominated military. From then on, a block formed among the Tutsi who were determined to control the government and army with law-and-order anti-Hutu policies. The monarchy was abolished, followed by a new politic of revenge. Hutu civilian and military leaders were assassinated in 1969, followed by liberal Tutsi "royalists" in 1971. In April 1972, a Hutu rebellion "scourge" organized by exiled leaders in East Africa, resulted in several thousand Tutsi in the south being killed, followed by a genocide of Hutu elites by Tutsi in May and June, leaving 150,000 dead and 300,000 as refugees in Rwanda and Tanzania (Chrétien, 2003). The break between Hutu and Tutsi became as acute as it was in Rwanda, founded on omnipresent fear,

"What is it to be Hutu or Tutsi? It is being neither Bantu or Hamite nor serf or master! It is to remember who killed one of your close relations 15 years ago or to wonder who will kill your child in 10 years, each time with a different answer" (Chrétien, 2003).

In Rwanda and Burundi in the late 1980s, two clichés were inescapable, "democracy of the Hutu majority" in Kigali and "national unity" with strong Tutsi law-and-order in Bujumbura (Chrétien, 2003). Chua (2003) believes it was "political liberalization" along with Belgium racism and favoritism, as well as

decades of corrupt dictatorship, that unleashed long-suppressed ethnic tensions and thus, laid the groundwork for genocide of what she calls a “deeply resented, disproportionately wealthy ‘outsider’ minority”, the Tutsi.

13.8.6.6 Let the genocide begin, America stops potential intervention through the United Nations

The straw that finally broke the camel’s back in the lead up to genocide was on April 6, 1994, with the shooting down of a plane as it landed at Kigali, Rwanda, returning from Dar es Salaam, resulting in the deaths of both Presidents Juvénal Habyarimana of Rwanda and Cyprien Ntaryamira of Burundi (Madsen, 1999; Gasana, 2002 *In: Matthew, et. al.*, 2002; Chrétien, 2003). This event took place at a moment of extreme ethnic tension in both Rwanda and Burundi in which three Hutu Presidents (Habyarimana, Ntaryamira and Ndadaye) had been assassinated within six months. Hutu elites in the presidential guard and militias used this incident in order to maintain control of the Rwandan state by rallying the poor and resource starved masses against the Tutsi and the Tutsi-dominated RPF. By July 19, 1994, the RPF had taken power, but not before a million people were slaughtered (Gasana, 2002 *In: Matthew, et. al.*, 2002). While the RPF army was disciplined, it still undertook reprisal killings of from 25,000 to 60,000 people (Diamond, 2005).

Some believe this plane crash was orchestrated by extremist Hutu from the north, who then militarily seized power (Chrétien, 2003), while others believe that this was undertaken by Kagame and his U.S. backed RPF forces, with American disinformation being used to lay the blame on militant Hutus (Madsen, 1999). Hammond (1996) states that Belgium troops with the United Nations Assistance Mission in Rwanda (UNAMIR) identified the missiles coming from the Hutu Rwandese Armed Forces/*Forces Armées Rwandaises* (RAF/FAR) military base at

Konombe. Madsen (1999) implies that America may have not only been aware, but was possibly behind this action. Meanwhile, in March 2004, the French newspaper *LeMonde* published excerpts from a report by an anti-terrorist judge that is the outcome of a six year investigation, accusing President Kagame as being responsible for the plane crash (Bryant, 2004).

The same night of the plane crash the genocide in Rwanda began with the military supporting the *Interahamwe*. The first to die were on a pre-prepared list of enemies: politicians, journalists, lawyers and businessmen, followed by roadblocks killing anyone without a Hutu identity card, Hutu's with ID cards, but who looked "Tutsi" in appearance, Hutu's who refused to take place in the slaughter and anyone looking educated and prosperous – thus assumed to be a Tutsi. This rapidly spread to the countryside, where neighbors who had lived in peace and harmony were suddenly demonic; "Bush clearing" referred to hacking men to death and "pulling roots" referred to killing women and children (Guest, 2004). This genocide was not an anarchic effect of "popular anger" provoked by the death of the father of the nation or an interethnic quarrel, but a deliberate choice by a moderate elite (Chrétien, 2003; Guest, 2004) who played on the fears and the frustrations of a poor, uneducated, over-populated rural populace.

"Well dressed assassins" (e.g., Hutu Bourgeoisie) let the peasants dirty their hands, but they were behind the lines coordinating events. Thousands of youth without a future were transformed into killers caught up in war hysteria. The misuse of lost disenfranchised youth will be discussed again in the case studies on the Niger Delta (see Section 13.10.1.3, Oil and Repression in the Niger Delta – Nigeria) and Sierra Leone (see Section 13.10.2.1, Sierra Leone, war and diamonds) and has already been raised earlier in concerns over the danger of such youth being recruited into global terrorism. Chrétien (2003) also believes the spiral of ethnization was accelerated by the Cold War, with Burundi as a base for

the Chinese to aid the Kivu based Lumumbist of Zaire (the Democratic Republic of Congo) and Rwanda a base for the U.S. Central Intelligence Agency (CIA), each instrumentalizing ethnicity (e.g., CIA working with Tutsi refugee nationalists) (Chrétien, 2003). This will be discussed in some detail below, showing how the Western industrial-military complex is helping to continue fueling anarchy in the Great Lakes region, aligning itself with various rebel and national factions, while compartmentalizing the region as a means of accessing cheap natural resources (Madsen, 1999).

In Rwanda, 800,000 people were killed in 100 days, mostly Tutsi, but also liberal Hutu, amounting to 75% (3/4) of the resident Tutsi population in Rwanda (Chrétien, 2003; Diamond, 2005) and 10% of the total population (Guest, 2004). This amounted to 333.333 people killed per hour or 5.5 people per minute losing their lives (Gourevitch, 1998). The Twa, a Pygmy group making up only 1% of the population and at the bottom of the socio-economic scale, were also massacred in the 1994 killings (Diamond, 2005).

13.8.6.7 Ultimate and proximate causes of Rwanda genocide

Diamond (2005) concludes that reprisals were not entirely ethnic, but also over scarce resources, especially land (see Chapter 5, Section 5.9.4.6, Deforestation in afromontane forests, Rwanda, Over-Population and Land Degradation Linked to Deforestation for Agriculture and Political Destabilization). The ultimate causes of the Rwandan genocide were population pressure, human environmental impacts and drought forming the powder inside the keg; with the proximate causes - the match that lit the keg being ethnic hatred whipped up by politicians and the downing of the airplane. In addition to population pressures, other factors contributing to this genocide include (Diamond, 2005):

- Tutsi domination of the Hutu;
- Tutsi large-scale killings of Hutu in Burundi and small-scale ones in Rwanda;
- Tutsi invasions of Rwanda;
- Rwanda's economic crisis;
- Drought;
- World Factors, including falling coffee prices and World Bank austerity measures (SAP policies);
- Hundreds of thousands of desperate young Rwandan men displaced as refugees in resettlement camps, ripe for recruitment into militias; and
- Competition among rival political groups willing to take power at all costs

Diamond (2005) fails to mention the American/French geo-political issues that came into play.

An example is given in the northwestern Kanama commune where 99% or more of the population is Hutu and land, not ethnicity, was the cause of killings. With population densities in 1993 of 788 inhabitants/km², the median farm size in 1993 was 0.29 ha (0.72 acres) on average, broken into ten small partials of 0.03 ha each. Young people were unable to acquire land, making it difficult to marry. A very big farm was about 1 ha and a very small farm 0.24 ha. The percentage of very big farms and very small farms both increased between 1988 and 1993 from 5% to 8% for very big farms and from 36% to 45% for very small farms; relatively speaking, a divide developing between the rich "haves" and the poor "have-nots". With more people living at home, the number of people per farm household increased from 4.9 to 5.3 between 1988 and 1993, resulting in the average household meeting only 77% of its caloric needs from the farm, relying on off-farm income (e.g., brick making, carpentry, sawing wood, trade). As all over Rwanda, these landless youth, averaging between 21 and 25 years old,

without off-farm income, were resorting to violence and theft. Unfortunately, the larger land owners also earned the largest off-farm incomes, increasing disparities. Between 1982 and 1990, the percentage of the population in the Kanama commune consuming less than 1,600 calories/day, considered below famine level, increased from 9% to 40%. Land disputes began to undermine the cohesion of traditional society; richer land owners expected to help poor relatives, even though the richer landowners were still poor. Disputes increased between fathers and sons over inheritance of land, as traditionally the oldest son was expected to manage the land for the whole family, parceling out pieces to his younger brothers. Now fathers were dividing the land among all sons to avoid conflicts after their passing. The 1994 genocide created a unique opportunity to reshuffle land properties all over Rwanda, in this case with Hutu killing Hutu (Diamond, 2005). Ultimately,

“people whose children had to walk barefoot to school killed the people who could buy shoes for theirs” (Diamond, 2005).

13.8.6.8 United Nation fails to take action

The West, including the United Nations, buried its face in its hands, only reacting after the fact with the Rwanda Tribunals in Arusha, which do not solve the problem and cost the world’s taxpayers millions of dollars. The current Head of the United Nations, Kofi Annan, then Chief of UN peacekeeping, refused to allow General Roméo Dallaire and his 3,000 “Blue Hats” from the United Nations Assistance Mission in Rwanda (UNAMIR) to take action, seeing this as “beyond the mandate entrusted to UNAMIR” (Gourevitch, 1998). This statement about Annan is reinforced by both Madsen (1999) and Dallaire (2003). This was even though the General Assembly of the UN declared genocide a crime under international law in the 1940s. The William (Bill) Jefferson Clinton Administration’s UN ambassador, and eventual Secretary of State, Madeleine

Albright, opposed UN intervention (Gourevitch, 1998; Madsen, 1999; Dallaire, 2003) even though Boutros Boutros-Ghali, UN Secretary General, pleaded to allow this intervention and condemned America's inaction. This eventually resulted in his being dumped and replaced by a more "docile" Kofi Annan (Madsen, 1999). Similarly, the Commission for Africa (2005) concludes that

"just 5,000 troops with robust peace enforcement capabilities could have saved half a million lives in Rwanda".

Dallaire (2003), though admitting Annan prevented him from intervening in the genocide, is not so harsh a critic of Annan, nor does he garnish too much praise on Boutros-Ghali. However, Dallaire (2003) does admonish the UN as an organization and the superpowers that control this body for sending too little too late:

- On April 22, 1994, about 16 days after the genocide started, UN Security Council Resolution 912 voted for a skeleton UNAMIR force, actually forcing Dallaire to withdraw about 1,000 troops to Nairobi with the idea of maybe getting them back if a cease-fire was agreed on in Arusha.
- On May 17, UN Security Council Resolution 918 authorized 5,500 troops, but was vague on the genocide and the role that the UNAMIR force should play in stopping it, the U.S. gutting the resolution.
- By June 19, 1994, when he should have had 4,500 troops on the ground there were only 503 men.
- Not until July 1, 1994, did the UN Security Council pass Resolution 935 that requested the secretary-general to establish a committee of experts to investigate possible acts of genocide in Rwanda.

"Ultimately, led by the United States, France and the United Kingdom, this world body (United Nations) aided and abetted genocide in Rwanda. No amount of cash and aid will ever wash its hands clean of Rwandan blood" (Dallaire, 2003).

Darfur, Sudan in 2004/2005 seems to be a repeat of this nonsense, the UN failing to take in the seriousness of reports coming in from the field and only after the fact, likely to acknowledge genocide; another bureaucratic snafu (see Chapter 5, Section 5.11.4, Darfur, Sudan, overpopulation, desertification, ethnicity, conflict and politics & Chapter 13, Section 13.10.1.6, Oil-scorched earth Sudan).

America was reluctant to get involved, having already been embarrassed in Somalia by a combined force of Iranian Pasdaran and HizbAllah fighters, Iraqi al-Saiqah Commandos, Iranian trained Somalis and Arab Afghans (Muslims trained in Afghanistan as *mujahideen* - Islamic holy warriors) who shot down two American Blackhawk helicopters, killed 18 Americans and dragged their bodies through the streets of Mogadishu, wounded 78 and captured a chopper pilot whom they displayed on international television (Madsen, 1999; Bodansky, 2001; Dallaire, 2003; DeCapua, 2004). In addition, President William (Bill) Jefferson Clinton felt the United States was already stretched thin by committing troops in South Korea and Europe, as well as the possibility of a greater commitment in Bosnia, along with reviving a UN agreement in Haiti (DeCapua, 2004).

Recent U.S. government documents released to the National Security Archive of George Washington University, under the Freedom of Information Act, show that the William (Bill) Jefferson Clinton administration was aware in late April 1994 that genocide was taking place, about two weeks after the start of the killings. However, it did not use the word publicly until much later, even though the intelligence community was using "genocide" as a description of the problem by April 26, 1994. The official position of the White House in early June was that the word genocide should not be used, that it was still impossible to determine if it

was genocide. The U.S. was not being asked to send troops, but rather was asked to give its political support in sending more UN troops (DeCapua, 2004).

A Presidential Decree came out stating that America would contribute to peace keeping operations only if it was in their vital interests. However, it was not in the interest of the United States to seek a negotiated settlement in this conflict with support from UN peace keeping forces (Madsen, 1999). Rwanda was an important piece of the puzzle needed by America in its hegemony over Sub-Saharan Africa, especially Francophone Africa.

While white-on-black violence would make the international press for days on end, even when the victim was one person (e.g., Rodney King), it seemed that black-on-black genocide was largely ignored until after the fact. Was this the shame of the “White Man’s Burden” for another failure in social-engineering, stemming from colonialism or outright racism where the death of “primitive Africans” failed to touch Western consciences? At the same time, wildlife in Akagera National Park was virtually wiped out. In 2006, attitudes are changing as Westerners demonstrate against genocide in Darfur, Sudan, but by early 2008 there has been little action on the ground.

13.8.6.9 The French connection

The French established the “*Zone Turquoise*” in southern Rwanda, which served as a safe haven for the proponents of “Hutu Power” where the killing continued unabated (Gourevitch, 1998; Madsen, 1999; Dallaire, 2003). The French hoped somehow to keep the pro-French Hutu government and its Rwandese Armed Forces/*Forces Armées Rwandaises* (RAF/FAR) in power over the onslaught of the U.S. backed English speaking Tutsi RPF movement (Madsen, 1999). President Kagame has accused the French government of not only training Hutu

troops and forces that carried out the massacres, but in having a direct hand in the killing (Bryant, 2004).

13.8.6.10 Big business for NGOs

About 750,000 former exiles, mostly Tutsi, returned to Rwanda (Diamond, 2005). Between 1.2 (Gasana, 2002 *In: Matthew, et. al.*, 2002) and 1.5 million (Chrétien, 2003) to 2 million (Diamond, 2005) Hutu fled to Zaire (the Democratic Republic of Congo) to escape revenge and to a lesser degree, to Tanzania and Burundi. The Hutu refugee camps in the Democratic Republic of Congo were controlled by armed members of the Rwandese Armed Forces/*Forces Armées Rwandaises* (RAF/FAR), who expropriated up to 10% of all foreign aid to support their actions (Chrétien, 2003). Humanitarian aid NGOs with Western aid money, knowingly fed these “Hutu Power” perpetrators of genocide. The business was too good, as 70% of the money went right into the pockets of the aid teams and their outfitters in the form of overhead, supplies, equipment, staff housing, salaries, other benefits and assorted expenses, leaving 25 cents a day/refugee, nearly twice the per capita income of the average Rwandan. The humanitarian NGOs were treated rather like the service staff at a “seedy mafia-occupied hotel”, providing food, medicine, house wares and an aura of respectability, becoming accessories to the Hutu Power syndicate. A political crisis was treated as a humanitarian crisis, perpetuating the political crisis and the suffering, misery and deaths of many people. Diverted humanitarian aid was used to purchase arms (Gourevitch, 1998) (see Chapter 11, Section 11.7.2, Foreign Assistance Conditionalities Good Business for Donor County Not Recipient/Host Country).

13.8.6.11 French and U.S. arm proxies for the takeover of the Democratic Republic of Congo

France, with Mobutu Sese Seko's accord, was known to have been directly and indirectly involved in supplying Hutu "refugees" with arms to continue their persecution of Tutsi, both in Rwanda and in the North/South Kivu provinces of the Democratic Republic of Congo (Madsen, 1999). It is estimated that ex-Hutu Rwandese Armed Forces/*Forces Armées Rwandaises* (RAF/FAR), (reassembled in the Democratic Republic of Congo), made up about 7% of the 1.5 million refugees fleeing Rwanda. They continued to re-arm and train with the Zairian Armed Forces/*Forces Armées Zaïroises* (FAZ), while using refugee camps as launching pads for FAR cross-border raids into Rwanda and Burundi (Pech, 2000 *In: Musah & Fayemi, 2000*).

This forced the American-backed RPF (Tutsi under Kagame), with backing from Uganda, to support Kabila under the "Alliance of Democratic Forces for the Liberation of Congo /*Alliance des Forces democratique pour la liberation du Congo* (AFDL/ADFL)" to over-throw the French-backed Mobutu Sese Seko government. Mabutu was what Museveni called an "agent" of his Western puppeteers, while the Hutu Power "genocidaires" owed their sustenance to the mindless dispensation of Western charity, with the false promises of international protection followed by swift abandonment of hundreds of thousands of civilians in the face of extreme violence (Gourevitch, 1998) (see Section 13.10.3.1, U.S. government involvement in the DRC and Section 13.10.3.2, U.S. military aid).

13.8.6.12 The aftermath in Rwanda

On July 19, 1994, a Government of National Unity was created that was to conform to the Arusha accords, with Pasteur Bizimungu, a Hutu member of the

RPF as President, a Hutu prime minister and Paul Kagame, Vice-President and Minister Of Defense and thus head of the Rwandan Patriotic Army that grew out of the RPF (Chrétien, 2003; Dallaire, 2003). By 1996, Rwanda began its pursuit of military adventurism, as would Uganda, Zimbabwe, Namibia and Angola among others, linked to resource booties as described below (Madsen, 1999) (see Section, 13.10.3, Congo-Kinshasa DRC, Sub-Saharan Africa's world resource war). It should be noted that in 1998, U.S. military trained Paul Kagame was elected Chairman of the Rwandan Patriotic Front (RPF), a partner in the Government of National Unity. On April 17th, 2000, Paul Kagame was unanimously elected President of the Republic of Rwanda by the Transitional National Assembly. He took the Oath of Office on April 22nd, 2000 (Kagame, 2005) and still holds the position in 2008.

The RPF control all important institutions in Rwanda; the army, police, bureaucracy, judiciary, banks, universities and state-owned companies. Elections can be annulled if the winner campaigns on a divisionist platform. Most Tutsi's believe that the only way to prevent another slaughter is for the RPF to remain in permanent power. Though efficient, while maintaining peace, there are complaints of censorship and, as will discussed below (see Section, 13.10.3 Congo-Kinshasa DRC, Sub-Saharan Africa's world resource war), Kagame and the RPF are ruthless, having been involved in the slaughter of Hutus just across the border in the Democratic Republic of Congo (Guest, 2004), with incursions occurring as late as December 2004.

Ten years after the Rwanda genocide, while registering strong economic growth, the Rwandan government is being accused as authoritarian and prejudiced against the Hutu as 80% of the 200 most important positions in government are Tutsi, even though they make up only 15% of the population. The Tutsi in power were being accused of being elitist, just as the Hutu are accused, not necessarily

representing the true interests of the Tutsi population. Hutu appointed to prominent positions have shadow Tutsi making key decisions (e.g., Permanent Secretary for a Minister, First Council for an Ambassador). The RPF claims that it is all inclusive and although having 80% of the seats in parliament, they make up only 50% of the cabinet. Some also say that there are Tutsi political elite divisions and rivalries within the RPF that could destabilize the country, even resulting in a coup *d'etat* (Eagle, 2004).

Gasana (2002 *In: Matthew, et. al.*, 2002) is concerned that there is still a winner-take-all mentality rather than a win-win relationship between both ethnic groups. There is still a fear by both ethnic groups that the one in power will dominate and oppress the one out of power, with an ethnic-based military backing an ethno-political regime as opposed to security of people and the environment. This threatens the survival of society, partitioning it into rival ethnic groups united by enmity and fear.

13.8.6.13 Post-genocide Burundi

Meanwhile, in Burundi, Madsen (1999) indicates that Pierre Buyoya, as the Tutsi dictator from 1988-1992, presided over the slaughter of thousands of Hutu. By 1992, there was a democratic constitution where amnesty was offered to returning refugees and President Buyoya, a Tutsi, expressed that (Madsen, 1999)

“ ‘Burundi is not exclusively a country of Bahutu where Batutsi are only guests. It is no longer a country of Batutsi where Bahutu are only second-class citizens.’ ”

A Hutu, Melchior Ndadaye, was elected the first civilian head of State in 1993 with a desire to eradicate “ethnic sickness”, forming a government that was 33% (1/3rd) Tutsi. However, a military takeover in 1993 threw much of this into

question, resulting in the assassination of Ndadaye (Chrétien, 2003). Buyoya was linked to this assassination and the slaying of 100,000 Hutus (Madsen, 1999). This was followed by a UN brokered election of Ntaryamira as President (Chrétien, 2003), who died in the plane crash, followed by a coup (once again by Buyoya) on June 25, 1996, against a democratically elected Hutu President, Sylvestre Nitbantunganya (Madsen, 1999).

The Tutsis believed that Nitbantunganya was providing cover for militant Hutus. Within three weeks after Buyoya seized power, 6,000 Hutu civilians were killed. Nitbantunganya's government was also seen as pro-Mobutu Sese Seko and thus, pro-French. Buyoya fit into the plans of the Clinton Administration, linked to the Tutsi allies in Rwanda, Uganda and eastern Zaire that would be used to take Kinshasa, overthrowing Mobutu Sese Seko, while placing Laurent Kabilal in power as an American puppet. By August 1996, Burundian Tutsi troops conducted joint operations with Rwandan RPF forces on Burundi Hutu refugee camps in the South Kivu Province where the Burundian Hutu rebel group, Forces For the Defense of Democracy/*Forces de Defense de la Démocratie* (FDD), had its headquarters (Madsen 1999).

By 1998, there were two vice-presidents in Burundi, a Hutu and Tutsi (Chrétien, 2003). This partnership is considered fragile and illusionary, with Burundi being trapped in two extremist camps, 1) The Tutsi conglomerate that controls the army and 2) The Hutu conglomerate hoping for a Rwandan model (Chrétien, 2003). Domitien Ndayizeye, a Hutu, succeeded Pierre Buyoya, a Tutsi, as head of a three-year transitional government on 30 April 2003, each serving for a period of 18 months. He had served as Vice-President during Mr. Buyoya's 18-month term. The government was set up in November 2001 as part of efforts to end ten years of civil war between the Tutsi minority, which has traditionally ruled the country, and the Hutu majority (BBC Monitoring, 2003). At the end of this three-year

period, elections will be held. The first ever African Union peace keeping force was established in April 2003, consisting of South African, Mozambican and Ethiopian troops in attempts to arrange cease fires between the government and various rebel groups (Africa Online, 2003) such as Forces of National Liberation and Forces For the Defense of Democracy/*Forces de Defense de la Démocratie* (FDD) (Dougherty, 2003). However, by December 2003, the UN Security Council agreed to send in a peace keeping force, as the AU did not have sufficient funds to continue the process (Africa Online, 2003).

Chrétien (2003) goes on to explain how the political-military elite from the hills of Rwanda in 1959 to the forests of Zaire in 1997 and throughout the Great Lakes region today, exploit the masses through a strategy of “ethnic conscious raising” and related tactics of excitement. Some call this “political tribalism”, flowing down from high-political intrigue through external competition, as opposed to politically constructive “moral ethnicity” that creates communities from within through domestic controversy over civic virtue (Chabal and Daloz, 1999) (see Chapter 11, Section 11.3, NEO-IMPERIALISM IN SUB-SAHARAN AFRICA and Section, 11.6.3, Neo-Patrimonial Clientelism, The Big Man and “Cosmetic Democracy”). The misuse of ethnicity through “political tribalism” is not unique to Sub-Saharan Africa, being seen recently in the former Yugoslavia.

Diamond (2005) concludes,

“...overpopulation, environmental impact and climate change cannot persist indefinitely: sooner or later they are likely to resolve themselves, whether in the manner of Rwanda or in some other manner not of our devising, if we don’t succeed in solving them by our own actions...similar motives...may operate again in Rwanda itself, where population today is growing 3%/year, women are giving birth to their first child at age 15, the average family has between 5-8 children and a visitor has the sense of being surrounded by a sea of children”.

Similarly, General Dallaire (2003) states,

“Rwanda was a warning for all of us of what lies in store if we continue to ignore human rights, human security and abject poverty...But many signs point to the fact that the youth of the Third World will no longer tolerate living in circumstances that give them no hope for the future...we can no longer afford to ignore them...the global village is deteriorating at a rapid pace and in the children of the world the result is rage...Human beings who have no rights, no security, no future, no hope and no means to survive are a desperate group who will do desperate things to take what they believe they need and deserve...if we do not immediately address the underlying (even if misguided) causes of those young terrorists’ rage (referring to 911 bombing of the World Trade Center, New York), we will not win the war...The lack of hope in the future is the root cause of rage. If we cannot provide hope for the untold masses of the world, then the future will be nothing but a repeat of Rwanda, Sierra Leone, The Congo and September 11...this new century must become a Century of Humanity...*Peux ce que veux. Allons-y*”.

13.9 GLOBALIZATION, AFRICA AND RESOURCE WARS – CAPITALISM WITHOUT A CONSCIENCE – BOOTY FUTURES

With the end of the Cold War, the only groups with any great interest in Sub-Saharan Africa are resource exploiters. Most of these groups are exploiting non-renewable resources and unfortunately appear to be taking a short-term perspective with regard to Sub-Saharan Africa and its development.

One could also argue, as being undertaken, that Sub-Saharan Africa’s renewable natural resources linked to logging, coastal development and hunting, with little or no monitoring, are currently still being plundered for short-term gains. Beneficiaries are mostly middlemen; governments, logging companies, tourism/safari operators and NGOs – NGOs living off large sums of donor money funneled to them. The beneficiaries receiving the least from the mining of these

resources are rural and coastal Africans, to whom by all rights the resources belong, but who have had them confiscated by colonialism and, since the 1960s, by the newly independent African governments (see Chapters 3 to 11).

Until the “land/resource owners” are given back title to their resources, until they are educated as to the value of these resources and are educated in a way that allows them to integrate Western concepts of resource management with traditional management and value systems, Sub-Saharan Africa’s natural resources will continue to be mined; on one hand by carpetbaggers and opportunists from the West and on the other hand, by poverty itself, which is forcing rural Africans to react in unsustainable ways towards their environment in trying to survive.

The private sector, seen as a key in collaborating with Sub-Saharan Africa to obtain the added value for its resources on the international market, must be one with a “conscience” that is sensitive to how they integrate their entrepreneurial skills both in creating wealth, but at the same time, in eliminating poverty and repression. The private sector has already helped Sub-Saharan Africa (mainly the political elite) generate wealth from using Western technologies and obtaining the added value from these resources on the international market, but for many reasons has not helped eliminate poverty nor the overwhelming hopelessness of the masses on the subcontinent. More of this wealth must reach the people living with these resources. This must occur if Sub-Saharan Africa’s natural systems, which most Westerners want to experience (“Wild Africa”), have a hope in hell of surviving the 21st century and if, as seen from 911, the “Western Way of Life” as we know it today is also to survive. While it may seem like they are two worlds apart, “Wild Africa” and our “Western Way Of Life”, the survival of both are integrally linked beyond the wildest imagination of the average person – and it is this which decision makers in the West must come to understand.

“During the decade of the 1990s, the number of civil wars in Africa almost doubled. One reason may have been the growth in Africa of a futures market for natural resources captured in battle what might be called the ‘booty futures’ market. The sale of booty futures is a tool of the weak against the strong: it has helped provide aspiring rebel groups with the funds they need to launch attacks on governments; it also provided governments on the verge of defeat with the money they need to fund counterattacks. It can hence fund the initiation of civil wars that might otherwise never begin, and lengthen wars that are on the verge of ending. The booty futures market has the greatest implications for the resource-rich states of Sub-Saharan Africa...armed conflicts in the rest of the world dropped by about 33% (one-third) between 1989 and 1999, while the number of armed conflicts in Africa rose. Africa accounted for 30% of the world’s armed conflicts in 1989” (Ross, 2002) (see Chapter 5, Section 5.10, CIVIL WARS - A MAJOR CAUSE OF DECLINING AGRICULTURAL PRODUCTION AND FAMINE IN SUB-SAHARAN AFRICA).

“The profit-oriented nature of contemporary civil war economies makes it difficult to implement a peaceful and sustainable end to the conflict. Indeed, economic agendas may lengthen civil conflicts because not only do they constitute a vested interest in continued conflict, they also tend to create widespread destitution, which itself may feed into economically motivated violence. Instead of an armed conflict between two or more distinct groups for control over the state, the parties are fighting to control economically-rich regions, trade corridors, ports, railways, and roads in order to gain access to the global market” (Black & Grant, 2002).

“The resources diverted from development uses by conflict—over and above any additional assistance provided by the international community—are estimated at \$US 1 billion a year in Central Africa and more than \$US 800 million in West Africa. To this must be added the costs of refugee assistance, estimated at more than \$US 500 million for Central Africa alone” (World Bank, 2000).

“The income from the trade in ‘conflict resources’ has been used to finance wars. ‘Conflict resources’ are resources, such as oil, diamonds, timber or COLTAN, the revenues from which enable warring parties to continue their activities - for example, by buying arms. Gaining access to such riches encourages coups and rebellions, and can become the reason for continuing hostilities.

Sometimes, money is raised not through selling the actual resources, but by using anticipated revenues to access loans or other forms of finance. Where the extraction and selling of natural resources form an important part of the war economy, wars tend to last longer and are more difficult to resolve – as has been the case in, for example, Angola, Liberia, Sierra Leone, Somalia, and the DRC. This is linked to the illicit arms trade, clandestine transport systems, money laundering, and criminal networks” (Commission for Africa, 2005).

13.10 RESOURCE WARS

“The moral measure of the U.S. trade relationship with Africa is whether it helps reduce poverty among Africa’s poorest peoples....Governments, International Finance Institutions (IFIs), and private corporations involved in the exploration, development, production, and sales of natural resources (e.g., oil, diamonds, timber, minerals, and precious gems) all have a moral responsibility to ensure that the otherwise legitimate development of these resources does not contribute directly or indirectly to corruption, conflict, and repression. Transnational Corporations (TNCs) ought to adopt codes of conduct that reinforce their social responsibilities, direct their activities toward the common good, and adopt transparency in operations and financial accountability. In certain cases, it might be necessary for international authorities to penalize abusive companies. These are concrete ways to protect and promote the rights, dignity, and social development of the peoples and nations of Africa” (U.S. Catholic Conference of Bishops, 2001 *In: Gary & Karl, 2003*).

“Resources provide a convenient way to sustain ‘justice-seeking’ rebel movements and are easily lootable assets that can encourage ‘loot-seeking’ rebellion. They can also help governments fund armies or buy popular support. The risk of civil wars has also been associated with political repression and the absence of political rights” (World Bank, 2000).

An Extractive Industries Review (EIR) undertaken by the Operations Evaluation Department, World Bank: IBRD/IDA (OED)⁵³⁷ found that in countries with a high dependency on primary commodity exports, the risk of civil war is 23%, compared to 0.5% risk in a country with no natural resource exports. These extractive resource dependent countries also had lower GDPs and lower performance in poverty alleviation compared to countries with little or no mining or petroleum capabilities (Bossard, Brule, Horta, Lawrence & Welch, 2003). Similarly, the Commission for Africa (2005) concluded that

“countries with the most oil, diamonds and other high-value natural resources are among those which have experienced the most war and armed conflict” (see Section 13.5, FAILURE TO DEVELOP GOOD GOVERNANCE IN MINERAL RICH COUNTRIES).

Africa has been identified as the site of 16 of 32 internal conflicts in 1996 and, in 1998, 14 of Africa’s 53 countries were engaged in wars, having the largest refugee and displaced population in the World, totaling 12 million persons (Zack-Williams, 2002 *In: Zach-Williams, et al., 2002*).

“Violent changes of government were the rule in this region prior to 1989, and the pattern continues today in countries such as Rwanda, the former Zaire (the Democratic Republic of Congo), Liberia, Sierra Leone, Ivory Coast and Sudan. However, there are some signs of an increase in democracy, most notably in the peaceful and democratic transition from minority white rule to majority black rule in South Africa” (CALTECH, 2002) (see Chapter 5, Section 5.10, CIVIL WARS - A MAJOR CAUSE OF DECLINING AGRICULTURAL PRODUCTION AND FAMINE IN SUB-SAHARAN AFRICA).

The neo-colonialism, which expropriated resources and the landscape, while alienating Africans from it

⁵³⁷ The World Bank is composed of the International Bank for Reconstruction and Development (IBRD) plus the International Development Association (IDA).

“...has its echoes throughout Africa – and the developing world generally – in everything from the gas flares of the Niger Delta to the way dollars for diamonds or oil provide impetus to wars in Angola, Sierra Leone or the Democratic Republic of Congo. It is repeated in the expulsion of the hungry herdsmen and spindle-thin cattle from national parks in East Africa (all over Sub-Saharan Africa) so that tourists can see more wildebeest and the lions can prey on them” (Maddox, 2002 *In: Dovers, Edgecombe & Guest, 2002*).

Today this colonialism is carried out through the globalization process by multi-national companies and conservation NGOs (see Chapter 11, Section 11.10, FOREIGN AID AND THE ENVIRONMENT), with support and manipulation by Western governments often in collusion with corrupt puppet governments who impose their value systems on Sub-Saharan Africa and/or plunder its resources.

Hoogvelt (2002 *In: Zack-Williams, et al., 2002*) feels that not enough has been done to challenge the divine right of foreign companies to bloody their hands for the sake of gaining access to the resources necessary to sustain lifestyles in the West. Although consumers in the U.S. and elsewhere are beginning to organize company boycotts to protest labor rights abuses by transnational manufacturing companies in the Third World, there is little consumer awareness in the West that diamonds, gold, rubber, copper, oil, aluminum, timber and in the past, ivory among other resources, are often extracted through wars and killings. Booker and Minter (2003) recommend that oil companies be required, as part of the international “Publish What You Pay” campaign, to provide transparency as to what they are paying the Nigerian government as a means of reducing corruption and holding the government accountable for investing in the people and the development of the country (see Section 13.12.1, “Publish What You Pay” an Attempt at Developing Transparency in Distribution of Wealth from Africa’s Natural Resources). The entrance of America, England and Australia into Iraq,

while done in the name of “weapons of mass destruction” and the over-throw of a despot, is believed by many to be more about control over strategic resources (oil) and geo-political control. This may be the first “global resource war” that awakens the citizens of the West to what is going on, since much of what has happened in Sub-Saharan Africa has been more clandestine and under-reported in the press.

Ultimately, the current means of resource extraction results in instability and increased poverty. Ordinary citizens, who are often the real owners of the resources, are left dispossessed and reliant on donor assistance (Global Witness, 2004) and can form the basis for radical terrorism against governments and their private sector allies.

Thus, Global Witness (2004) believes that:

- Taxpayers in the North are required to compensate for state failure in the South in the form of aid: this is inefficient and undermines the current donor emphasis on improving governance in non-transparent countries;
- The international community faces instability that, in some cases, directly threatens the security of energy supplies (e.g., civil war and terrorism); and
- Current policies of energy security seem to rely on leaving failed and failing states alone whilst the resources keep flowing out.

13.10.1 Africa and its oil

When taken as a group, all

“ ‘rich’ less developed countries dependent on oil exports have seen the living standards of their populations drop – and drop dramatically” (Gary & Karl, 2003).

“ ‘Oil should be for the life and not the death of our people’ ” (Catholic Bishops of Congo Brazzaville *In:* Gary & Karl, 2003).

“Our oil is still, in most cases, the private reserve of the powers that be . . . Central Africa wallows in misery despite the growing discoveries of oil . . . Our involvement, as a church in Central Africa, with the issue of oil does not arise from meddling in issues reserved for State authorities. We are witnesses to the suffering of the people to whom we belong. Our prophetic mission impels us to launch a heartfelt appeal to all those who participate in oil exploitation in our region or who wield any political and economic power. – Statement of the Catholic Bishops of Central Africa – (Association of Episcopal Conferences of the Central African Region), July 2002, issued in Malabo, Equatorial Guinea” (*In:* Gary & Karl, 2003).

“What is likely to happen if African countries...exploit oil in the context of very weak political and economic institutions? What is likely to happen is that oil will exacerbate profound political and economic crises...It will lead to a reduction of the welfare of people in oil exporting countries. It will provoke violence and unrest. It will lead to the violation of rights. It will lead to the destruction of the environment. It will buffer authoritarian rule. That’s what will happen, again, if (oil investment) is inserted in weak political and economic and social institutions without interventions to see that something to the contrary occurs” (Professor Terry Karl, Stanford University *In:* AOPIG, 2002).

“Oil has become a frontline globalization issue, not only because of the corruption and conflict it breeds but due to the negligible development contribution it tends to make in poor countries. It is not labor-intensive and thus creates few jobs and secondary industries. Its sole potential benefit for the poor is the money that

goes straight into government coffers. In the absence of transparency, this money is easily embezzled” (Brottem, 2004).

For instance, in Equatorial Guinea, “government oil revenue is paid into treasury accounts held abroad” with little or no transparency, while Nigeria and Gabon have “squandered huge amounts of export earnings” (Kabemba, 2003).

Oil and American Foreign Policy

U.S. Energy Secretary, Spencer Abraham, told Congress,

“Energy from Africa plays an increasingly important role in our energy security” (Royce, 2002).

“Yet bad governance in West Africa threatens its growing oil producer status. Three years after shedding a military dictatorship, now-democratic Nigeria still labors with deeply rooted corruption. While a decades-long civil war in Angola has mercifully wound down, one watchdog group has charged that a remarkable \$US 1.4 billion dollars of its oil revenue went unaccountable last year (2001)” (Royce, 2002).

“The (U.S.) Secretary of State for Africa, (Walter) Kansteiner, made it explicit: ‘It is undeniable that African oil has become a national strategic interest for the USA.’ The reason for this goes beyond the oil lobby linked to the president and his whole staff (it is hard to find a single one who is not on the payroll of some oil multinational). In Africa, moreover, it seems possible to make one of the new priorities of the White House futurologists come true: new economic and military protectorates. Which is to say: direct military control over a territory – without the boundaries or institutions that are properly those of a state – to be exploited for its primary resources. Situations like this would enhance U.S. strategic independence and be useful for the direct control over the areas involved. While the frontiers and carving up in the oil circle in Caucasus and Afghanistan goes on, in Africa the number of new reserves discovered and tapped has increased. New wells and pipelines are springing up all over. Cameroon is about to become an ever more important supplier of crude oil (the plans for an oil

duct from Chad to Cameroon moves apace), at the cost of a devastating impact on the environment and an ever lower level of democratic tolerance. Equatorial Guinea has been a good supplier for years (above all to the USA), so much so that a blind eye is turned toward the murders, disappearances, and shady dealings of a scandalous system. Gabon, a hunting reserve for the French company Totalfina-Elf, has been for decades the prize to be won in a high-stakes game between giants in the sector. From the Morocco government come rumors – to which U.S. diplomacy pays close heed – of important oil reserves in the Western Sahara; which would mean, among other things, an end to any possibility of self-determination for the Saharawi people” (Jampaglia, 2002).

It should be noted, as discussed above, that after “WSSD/World Summit on Sustainable Development – Earth Summit” of 2002 in Johannesburg, South Africa, two of the first acts that U.S. Secretary of State Collin Powell undertook were visits to the oil-rich countries of Angola and Gabon. On the positive side, he told dos Santos, the President of Angola, a former Marxist now supported by the West, to stop asking for donor handouts and to start using the income generated from oil to develop his country (VOA, 2002). In Gabon, on behalf of the USA, he gave US\$ 50 million for the protection of forests and the turning of 10% of Gabon into parks (ANON, 2002a) (see Section 13.8.2.2, America declares the end of France’s *chasse gardeé*). The oil-rich Gulf of Guinea may be the most important strategic area in Sub-Saharan Africa.

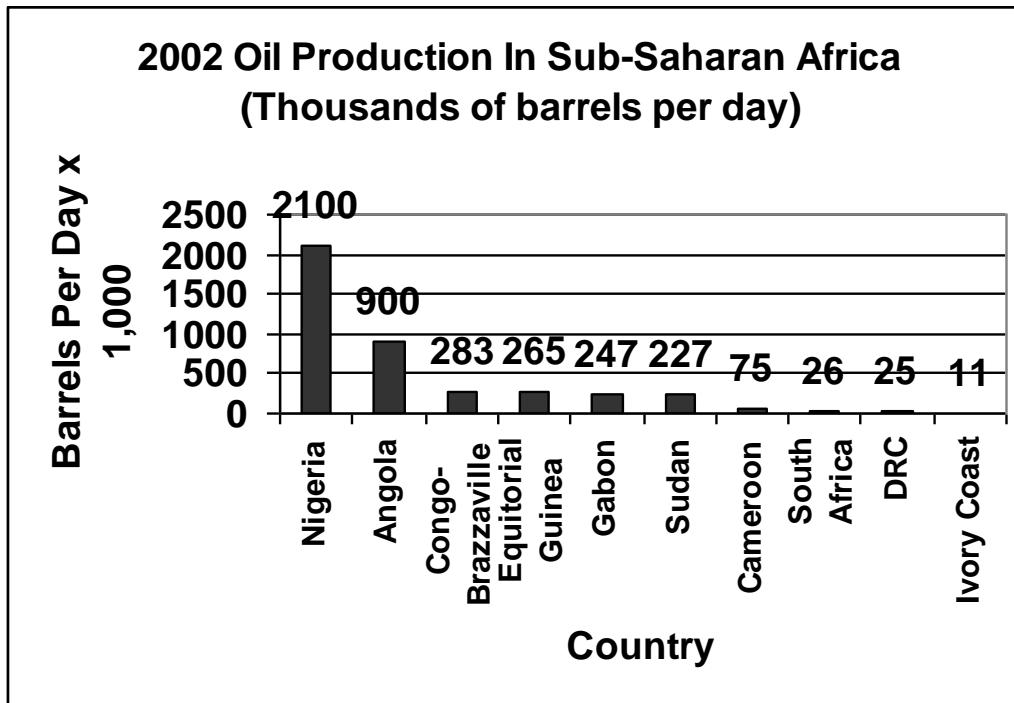

In 1993, the earliest year for which there were full figures, 494,000 barrels/day or 7% of U.S. imports came from the Gulf of Guinea versus 1.6 million barrels/day or 25% of U.S. imports from the Persian Gulf according to the Energy Information System (Harris, 2007). By 2001, approximately 15% of America’s oil came from Sub-Saharan Africa (AOPIG, 2002). In 2001, 1.5 million barrels a day of oil came to American shores from Sub-Saharan Africa, including shipments from Nigeria, Angola, Gabon, Equatorial Guinea and Congo Brazzaville (AOPIG, 2002; Royce, 2002). By 2006, Sub-Saharan Africa could supply eight million

barrels of oil a day compared to 3.8 million/day (Kotch, 2005) to 4 million/day today (Murdock, 2002). Currently, of the 3.8 to 4 million barrels/day from Sub-Saharan Africa, 1.5 million/day (38%) go to the U.S. and Canada, 1.3 million/day (35%) to Asia-Pacific, 0.7 million/day (20%) to Europe, 0.2 million/day (5%) to Latin America and 0.09 million/day (2%) to Africa (Kotch, 2005). In fact, by 2006 Sub-Saharan Africa provided 1.8 million barrels/day or 18% of U.S. oil imports compared to 2.2 million barrels/day or 21% of U.S. imports from the Persian Gulf (Harris, 2007).

The largely offshore oil between the Ivory Coast and Angola yields low-sulfur petroleum necessary for developing gasoline (petrol) (Murdock, 2002). The Gulf of Guinea region, covering West and Central Africa, is generally viewed by the oil industry as the world's premier "hotspot", soon to become the leading deepwater offshore oil production center. New technology for deeper offshore drilling has made West Africa one of the world's top oil prospecting regions (Royce, 2002). Nigeria is the world's 6th largest oil exporter and 5th ranked provider of crude to the U.S. at over 900,000 barrels/day (AOPIG, 2002). Nigeria alone could produce up to three million barrels of oil a day (Royce, 2002). Sub-Saharan Africa has about 7% of world's proven oil reserves, estimated at 24 billion barrels in the Gulf of Guinea alone, while seven billion of the eight billion barrels of crude oil discovered in 2001 came from fields off West and Central Africa's Atlantic Coast (Gary & Karl, 2003). Kotch (2005) estimates Africa to have 8% of the worldwide oil reserves of which 3.7% come from Sub-Saharan Africa, 57% from the Middle East, 15.5% from the USA/Canada, 9% from Latin America, 6% from the former Union of Soviet Socialist Republics (USSR), 3% from the Asia-Pacific and 1.5% from Europe.

In West Africa, Mauritania is expected to yield significant oil finds after initial prospecting success, as is Niger. Senegal and Guinea-Bissau are in the exploration

phase, while Côte d'Ivoire is a small, but growing producer. Sierra Leone recently launched an offshore bidding round and, in East Africa, Sudan is an active oil producer. While oil exploration off Kenya and Tanzania has not been successful to date, drilling in the Semliki Valley in western Uganda reportedly struck oil. Seismic surveys in 1999 revealed a potential for almost one billion barrels. The northern and southern Lake Albert basin is of interest, with this potential field being shared with the Democratic Republic of Congo. Exploration is ongoing offshore of Madagascar and South Africa (Gary & Karl, 2003) (Figure 13.4).

Figure 13.4: Oil production in Africa

Some project that with problems in the Middle East (i.e., Persian Gulf oil supply), oil from Sub-Saharan Africa could rise to 25% (or more) of America's imports by 2015 (AOPIG, 2002; Royce, 2002; Voice of America, 2002; Gary & Karl, 2003), amounting to over 2.5 million barrels/day (AOPIG, 2002) (see Section 13.8,

FRANCE/US ANGLOPHONE COMPETITION FOR INFLUENCE AND RESOURCES IN AFRICA – NEW SCRAMBLE FOR AFRICA).

Between 67% and 75% of U.S. Foreign Direct Investment (FDI) in Africa in the next decade will be in the energy sector, projected to exceed US\$ 10 billion/year by 2003 (AOPIG, 2002). It is expected that more than US\$ 50 billion, the largest investment in African history, will be spent on African oil fields in the next seven years (Gary & Karl, 2003). The Catholic Relief Services (Gary & Karl, 2003) and CAFOD (2004) estimates that centered in the Gulf of Guinea from Nigeria to Angola, Sub-Saharan African governments will receive over \$200 billion in oil revenues over the next decade.

Angola currently captures between 40% and 75% of revenues raised from its petroleum and Congo Brazzaville earns between 35% and 40%, the difference going to the private sector. Nigeria, having learned from the Organization of the Petroleum Exporting Countries (OPEC), captures between 50% and 70% of oil revenues from international companies. In contrast, newcomers Equatorial Guinea earns 10% to 20%, while Chad earns only about 10%.

“This means that the older exporters have had a greater opportunity to use oil wealth to alleviate poverty. Yet, despite their enhanced prospects from capturing more oil rents, the oil-led development trajectory of these older exporters is similar to that of exporters in other regions of the world” (Gary & Karl, 2003).

This will potentially enable them to vastly improve lives through investment in health, education and other vital services, even though the history to date demonstrates that petrodollars have not helped developing countries to reduce poverty, but in fact have actually exacerbated it (Gary & Karl, 2003).

Corruption and Natural Resources

Stiglitz (2002) is concerned, especially in the fields of mining, oil and natural resources in the developing world that Foreign Direct Investment (FDI) comes about from corruption and bribery of government officials as a means of obtaining concessions at low prices. This results in a dual economy in which there are pockets of wealth still surrounded by a majority of poverty, but not a developing economy of transformation that helps eliminate poverty and which creates a middleclass. The rich get richer, the poor get poorer and the multi-nationals, by paying off a few elites, take the resources out as cheaply as possible, with little or no environmental controls or worker safety – maximizing their net profits. Perkins (2006) provides a typical example of how profits from oil are split for every US\$ 100 of crude: 1) the oil company receives US\$ 75, 2) 0.75% of the remaining US\$ 25 is used to pay off debt, 3) US\$ 2.50 goes to health, education and other programs helping the poor and 4) the remainder goes to cover military and other expenses. Bond (2002) describes this as externalizing the environmental and social costs of extraction and production. Similar to how mineral resources in general have impacted development (see Section 13.5, FAILURE TO DEVELOP GOOD GOVERNANCE IN MINERAL RICH COUNTRIES), oil has hurt development (Gary & Karl, 2003) in the following ways:

- Raising expectations and appetite for spending;
- Increase public spending based on unrealistic revenue projections;
- Increase in public spending on “white elephant projects” and massive corruption;
- Volatility of oil prices hinders growth, distribution and poverty alleviation;
- Encourage the loss of fiscal control, inflation and budgetary deficits, further hampering growth, equity and the alleviation of poverty;

- Foreign debt grows faster in oil-exporting countries, mortgaging the future;
- Non-oil productive activities are adversely affected by the oil sector in a phenomenon called the “Dutch Disease”, pushing up the exchange rate (stronger local currency) and making other products non-competitive, especially in the agricultural and manufacturing sectors, while the oil industry provides little employment; and
- Petrodollars replace more stable and sustainable revenue streams, exacerbating the problems of development, transparency and accountability, since tax payers can no longer hold their governments accountable since they pay little or no taxes.

That is to say,

“Government institutions in the Gulf of Guinea are weak and sometimes inexperienced with oil contract negotiations. As oil becomes the dominant economic activity of a country and the leading export activity, governments become dependent on oil money as the main source of revenue and foreign exchange and as the economic basis of their power (Table 13.2). This dependence on oil revenues negatively affects the capacity of states and their ability to govern. The more governments spend, the more they need oil revenues...However, the volatility of oil prices – the rapid fluctuation from \$US 8 to \$US 35/barrel and back – further undercuts efforts to turn oil wealth into other more permanent forms of sustainable development” (Gary & Karl, 2003) (see Section 13.10.1.3 Oil and Repression in the Niger Delta – Nigeria and Chapter 12, Section 12.3.4, Structural Adjustment, U.S. Movement to Control Developing Economies).

Table 13.2: Economic dependence on oil by key African exporters, 2002 estimates			
Country	%GDP	%Exports	%Govt. Revenue
Nigeria	40	95	83
Angola	45	90	90
Congo Brazzaville	67	94	80
Equatorial Guinea	86	90	61
Gabon	73	81	60
Cameroon	4.9	60	20

If new oil revenues are to advance the development of Sub-Saharan Africa, the United States and others must promote transparency and the rule of law in oil-producing countries. It is sobering that the average Nigerian today is worse-off than 25 years ago despite the US\$ 300 billion in oil revenue that the country has generated since then (Royce, 2002; Gary & Karl, 2003), while per capita income remains less than \$1 a day and Nigeria has performed worse in terms of basic social indicators than Sub-Saharan Africa as a whole, “the paradox of plenty” (Gary & Karl, 2003).

“Social needs in Africa’s oil producing countries are immense. Roads and schools must be built, HIV/AIDS must be fought, and clean water wells must be drilled. New oil revenues could go far in addressing these pressing needs. The United States stands to gain from increased African oil production. We will gain the most, however, if these revenues are used to improve the lives of the Africa people, not corrupt African rulers” (Royce, 2002).

However, to date, money from oil has been spent on anything, but development.

“In the decade from 1984 to 1994, for example, OPEC members’ share of annual military expenditures as a percentage of total central government expenditures was three times as much as the developed countries, and two to ten times that of the non-oil

developing countries. From the perspective of poverty alleviation, the sheer waste of this military spending is staggering" (Gary & Karl, 2003).

In turn,

"oil rents have tended to impede democratization and have sustained a long line of authoritarian rulers – from the Shah of Iran to Nigeria's Abacha to the House of Sa'ud to Saddam Hussein. These regimes prohibit the types of organizations that provide a voice for the poor, create an informed civil society, and permit their people to influence the management and allocation of oil wealth...Fights over oil revenues become the reason for ratcheting up the level of pre-existing conflict in a society, and oil may even become the very rationale for starting wars" (Gary & Karl, 2003).

As will be seen from the "Case Studies" below, there will have to be a major change in how multi-nationals and Western governments relate to Sub-Saharan Africa, as it is they who have often been supportive of and/or ignore national corruption by African elite, regardless of the consequences to Sub-Saharan Africa's people. Shiner (2004a), of the Voice of America, sums up this issue very nicely:

"But the question remains whether revenues from the oil boom will reach Africa's poor. Corruption has bled Nigerians and Angolans of resources that could have dramatically improved education and healthcare. Gavin Hayman works for Global Witness, which aims to expose the link between natural resource exploitation and human rights abuses. He says, 'My main worry is where are the revenues from that oil development going and the oil money? One of the key problems is that American companies often sign confidentiality deals to work in countries like Angola, which means they don't disclose any info about revenues they're paying to government and government doesn't discuss any information about what it's received from the companies. And meanwhile billions of dollars are going missing that should be going for sustainable development and poverty alleviation.' "

13.10.1.1 Oil, corruption, multi-national complicity and backwardness in Equatorial Guinea

Equatorial Guinea, boosted by oil revenues ranks among the highest per capita GDP in the world, yet ranks near the bottom of the UN Human Development Index (HDI) (Harris, 2007).

“there are troubling signs that once obscure Equatorial Guinea, a traditional coffee and cocoa producer, may be falling prey to bad governance fueled by its recent oil revenue bonanza. Managing a flood of petrodollars and fending off corruption is not easy, but a deteriorating political and commercial environment could freeze African oil production if energy companies lose the stomach to invest in the region” (Royce, 2002).

The *Washington Post* newspaper reports that a grand jury is looking into whether bribes were paid by U.S. oil companies through accounts at U.S.-based Riggs Bank to the leader of Equatorial Guinea, Teodoro Obiang Nguema

“...President Teodoro Obiang Nguema founded the Democratic Party in 1987, eight years after he came to power in a coup that toppled his uncle, who was then executed. Equatorial Guinea, which has a population of just one million, is Africa’s third-biggest oil producer, but ordinary citizens have not benefited” (Colombant, 2004a).

It has been called the “Kuwait of Africa” (Tate, 2004).

Riggs National Bank of Washington, D.C. Linked to Laundering Oil Money

The Senate Permanent Subcommittee on Investigations found that since 1995, Riggs National Bank of Washington, D.C. helped Equatorial Guinea, its largest customer, siphon oil revenues amounting to US\$ 700 million through 60 accounts belonging to the government, the president, government officials and their

families. Riggs National Bank is also being investigated by the U.S. government as possibly laundering Saudi money used in terrorism. Equatorial Guinea has been cited by the U.S. State Department for human rights abuses, corruption and diversion of oil revenues to government officials. The U.S. Senate said this money should have gone to help impoverished Equatorial Guineans, but in fact, since oil came on-line, human development indicators have gone backwards (Tate, 2004). Equatorial Guinea was Riggs Bank's single largest depositor.

"At the same time, his country's inhabitants were wallowing near the bottom of almost every global index of health, literacy and life expectancy...Nguema survives in part because his tiny country pumps 350,000 barrels of oil a day and has reserves of 1.2 billion barrels, along with 1.3 trillion cubic feet of natural gas. As a result, oil companies and governments are willing to support a regime that has long since silenced the press, driven almost a third of its population of 540,000 into exile and crushed any hint of dissent" (Farah, 2006).

U.S. Secretary of State, Condoleezza Rice, called Obiang Nguema a "good friend" while being photographed with him during a recent visit to her office (Farah, 2006). The Riggs Bank name no longer exists, being taken over by a merger with PNC Bank in 2005.

Corporate Corruption

While Marathon Oil Company, Exxon-Mobil and Amerada Hess claim otherwise, Global Witness noted that the U.S. Senate Committee found that oil companies paid money into personal accounts of Equatorial Guineans that was used to buy land, lease offices and to educate children of the country's leaders (Tate, 2004).

"The Senate report calls on Congress to strengthen the Foreign Corrupt Practices Act to require that U.S. oil companies disclose substantial payments they make to foreign governments, or to

business ventures with links to foreign government officials or their family members" (Tate, 2004) (see Section 13.12.1, "Publish What You Pay" an Attempt at Developing Transparency in Distribution of Wealth From Africa's Natural Resources).

U.S. Government Employed PMC

The U.S. State Department granted a license to the U.S. private military contractor, Military Professional Resources Inc. (MPRI)⁵³⁸ of Alexandria, Virginia, to advise the government of Equatorial Guinea on building a coast guard to protect their oil-rich territorial waters, but the State Department turned down the proposal by MPRI for training of police and military forces on human rights grounds (Gary & Karl, 2003).

13.10.1.2 Gabon, France's Alaska

Gabon's per capita GNP of US\$ 3,300 as of 1985, is the highest in Sub-Saharan Africa. Gabon produces 9 million tons [\approx 180,000 barrels per day (bpd)] of oil annually. It is the second largest producer of crude oil in Africa and this produces 67% (2/3rds) of government revenue (on average 65% of total export revenues). Shell-Gabon and Elf-Gabon are major companies. Port-Gentil is the center for oil wells (Ministry of Tourism, 1995 *In:* DeGeorges, 1995). In 1992, petroleum exports of 14.6 million tons (\approx 292,000 bpd) totaled US\$ 1.8 billion of a total US\$ 2.2 billion in export earnings, amounting to 55% of GDP and 82% of export earnings (see Table 13.2: Economic dependence on oil by key African exporters, 2002). There are large onshore and offshore areas still to be exploited. Output was expected to increase to 17 million tons/year (\approx 340,000 bpd) over the next five years (U.S. Embassy Gabon, 1993 *In:* DeGeorges, 1995).

⁵³⁸ Military Professional Resources Inc. (MPRI), 1201 East Abingdon Drive, Suite 425, Alexandria, VA 22314, and 11 Canal Street Center Plaza, Suite 301, Alexandria, VA 22314, Tel: Toll Free 800.634.2874 or local at 703.684.0853, <http://www.mpri.com/>.

France's Alaska

The French consider Gabon as their territory. After independence in 1960, Gabon did not want to be independent. It was a safe place to live and the local population was low, so many “Blue Collar” French stayed and became rich and their children were born and lived here. France does not want Americans competing with them. Anyone entering into Gabon needs a French partner or will fail. The French and thus Gabon will do everything possible to discourage Americans, such as off loading freight destined for Libreville at Port-Gentil or Point Noir. The French consider oil in the Gulf of Guinea, “Their Alaska” – a strategic resource, and will protect oil at all costs (Harding, *pers. comm.* In: DeGeorges, 1995)⁵³⁹ (see Section 13.10.1.4, Petroleum war, Congo Brazzaville).

Normally oil leases are put up for bid, but in 1993, the French firm of ELF/Gabon was awarded a non-competitive lease for 13 blocks. At the time, only four U.S. firms were left, including Oxypetroleum, Conoco and Mobil that was only distributing oil (U.S. Embassy Gabon, 1993 *In: DeGeorges, 1995*).

“Gabon and Elf Gabon were also giant piggy banks that allowed Elf and France to conceal bribery and wield other tools such as mercenary and arms-dealing services, either in pursuit of oil deals or towards more overtly geopolitical ends” (Transparency International, 2004),

including uncovered payments to politicians in Africa, Central Asia, China, France, Germany, Russia, Spain, Taiwan, the United States and Venezuela. The Elf “system”, in place since the 1960s, had two other purposes; the covert financing of France’s main political parties and secret services, plus personal enrichment of French politicians and elites (Transparency International, 2004).

⁵³⁹ Peter Harding, Second Secretary, in charge of Economic and Commercial Affairs, U.S. Embassy.

Other major resources available from Gabon include manganese, uranium, phosphate, iron, baritone, gold, lead, chromium, diamonds and timber (DeGeorges, 1995).

President Bongo, Africa's longest serving head of state since 1967 (believed second longest reign in modern times after Fidel Castro of Cuba, leader since 1959), concerning an attempt by America to drive the French from the African continent, has said (Madsen, 1999)

“ ‘how else can you explain that the slightest spark in this part of the Continent is immediately fanned.’ ”

Bongo is said to be on the American hot target list (Madsen, 1999). As noted, U.S. Secretary of State Colin Powell's visit to Gabon after the 2002 Earth Summit and his pledge of US\$ 50 million to save Gabon's forests and biodiversity, could very well be the beginning of the “poker match” for the takeover of this resource rich country from the French by the United States. As will be seen, America lost the match in Congo Brazzaville.

Gabon's Oil Running Out

However, Gabon's oil is beginning to run out. Production has dropped by 33% (1/3rd) and government revenues 50% (1/2) in the last five years and may fall by half (50%) again by 2006. Gabon could be in real trouble, suffering from the “Dutch Disease” and is a classic “enclave economy”, due to both the lack of linkages with other productive economic sectors and the physical isolation of rigorously defined areas of production. With the exception of the exploitation of forestry resources (the country's second economic sector) and the declining mineral sector, all economic activity is concentrated in the heavily circumscribed urban centers (Gary & Karl, 2003). Only about 1% of total land area is under cultivation, depending entirely on imports for its food. President Omar Bongo has

squandered Gabon's wealth. Once garnering the title of the "world's largest per capita importer of champagne", it faced bankruptcy a number of times. Like Congo Brazzaville, despite its oil revenue, Gabon has managed to borrow against its future oil production, spending more than it makes, with the net result that more than 50% of Gabon's 2003 budget is earmarked for debt service (Gary & Karl, 2003). There is concern that both those inside the patronage circle, as well as those left out from oil riches in the past, understand that there will be no future benefits for either. This could put Gabon's much vaunted "stability" to the test (Gary & Karl, 2003).

13.10.1.3 Oil and Repression in the Niger Delta – Nigeria

Nigeria has always been a somewhat ethnically divided country, with the Hausa/Fulani in the north, Yoruba in the west and Ibo in the east. This has been fueled by colonialism (see Chapter 3, Section 3.1.4.2, Anglophone Africa). The Ibo tried seceding in 1966, declaring this area as the independent state of Biafra, which lead to a war. As the French were uneasy about a large English-speaking area in the midst of Francophone Africa, France backed Odumegwu Ojukwu, who led the succession, encouraging Gabon and the Ivory Coast to do the same. France supplied arms and legitimacy to the succession. Oil, a market for French goods and *Francophonie* were at stake. Ultimately, the succession failed and Nigeria became the 6th largest oil producer in the world, while the corrupt elite siphoned off the wealth, leaving 90 million underfed people, a slim middleclass and a fringe of multimillionaires (Rosenblum & Williamson, 1987).

Oil Enriched Elite, Disenfranchised Poor

Oil, gold and diamonds, not a commitment to democracy, seem to guide America's relationship with many of Africa's quasi-dictatorships, including Nigeria (Madsen, 1999). In a recent news interview, Britain's Tony Blair called Nigeria a fine example of democracy in Africa (Blair, 2002).

Currently, 90% of the national wealth is estimated to be in the hands of only 10% of the population, a small oil-enriched elite and their networks, with \$3 billion/year going to debt servicing of foreign loans and billions in overseas assets stolen by former military rulers. Nigeria owes about \$29 billion to foreign creditors, many loans they knowingly provided to corrupt and repressive governments. Meanwhile, poverty has increased from 28% in 1980 to 66% in 1996 and to about 70% of the population in 2000, while an average of three million people/year enter a saturated job market without skills (Booker & Minter, 2003). Likewise, Harris (2007) concludes despite this incredible oil revenue that amounts to hundreds of billions of dollars over the last 30 years, much of which has been squandered, 70% of Nigeria's population lives on less than US\$ 2/day. As of the year 2000, Nigeria was spending less than 1% (national target 15%) of its GDP on health and less than 1% on education, with more than 2.5% going to pay off foreign debts. The "democratically elected" Obasanjo government (replaced in questionable elections by Alhaji Umaru Yar'adua in 2007) has apparently begun putting into place anti-corruption measures, though Nigeria still ranks as the second most corrupt government in the world (Booker & Minter, 2003); the 3rd most corrupt in 2004 [see Chapter 11, Table 11.2: 2004 Corruption Perception Index (CPI)].

Nigeria ranks 13th in the World in oil production, but number one in Africa, producing low-sulfur crude oil (Richards, 2002 *In: Zack-Williams, et al.*, 2002). In 2002, Nigeria was the 5th largest supplier of oil to the U.S., ranking only behind Canada, Saudi Arabia, Mexico and Venezuela. It produces over 2 million barrels of oil/day with a little less than half of this going to the USA. In the last two decades, oil has supplied more than 90% of Nigeria's export earnings and more than 80% of federal government revenues. However, Nigeria's oil industry employs only about 100,000 people out of a population of over 100 million

(Guest, 2004). As it is dependent on one raw product, as much of Sub-Saharan Africa, Nigeria faces a boom or bust economy, with crude oil prices varying widely on the international market; US\$ 10/barrel in January 1999, almost US\$ 29 a barrel in September 2002 (Booker & Minter, 2003) to over US\$ 40/barrel in mid-2004, over US\$ 60/barrel by mid-2005, surpassing US\$ 75/barrel by April 2006 (Read, 2006) and over US\$ 80/barrel by mid-September 2007 (see Chapter 12, Figure 12.1: Sub-Saharan Africa's "Terms of Trade" by country group, 1965-1997). It is estimated that the Iraq war has raised the global price of oil by at least US\$ 5-10/barrel (Carothers, 2007).

Oil Wealth Linked to Reduced Food Self-Sufficiency

Nationally, in the last three decades, over-dependence on oil to drive Nigeria's economy has eroded the country's capacity for food production, leading to a decline in agricultural exports such as cocoa, palm oil and peanuts (Booker & Minter, 2003). Agriculture was abandoned in favor of importing food, which in the early 1980s amounted to US\$ 2 billion/year. This worked fine until the oil shock of the mid-1980s when the price fell from US\$ 25 to below US\$ 9/barrel. Corruption and anarchy reigned (Rosenblum & Williamson, 1987). Manufacturing also declined, with capacity utilization dropping to 30% or less. At the current rate, Nigeria's known reserves will be exhausted in only 30 years. Nigeria's almost 130 million people make up nearly 17% of Africa's population (Booker & Minter, 2003). Unless Nigeria starts planning for the future, it may have no future. The stage is set.

Oil and Environmental Degradation in the Niger Delta

If one looks at a global satellite picture at night, northwestern Europe and much of the USA are covered with light, while other than the Nile Valley and Johannesburg, the rest of the continent is “Dark”. Lagos and Nairobi are pinpricks of light. The western half of Africa is totally blank. The one blaze of light that rivals North America or Europe comes from the natural gas being flared from the Niger Delta (Nigeria) oilfields by a country and industry heedless of the environmental consequences or energy requirements of future generations (Richards, 2002 *In: Zack-Williams, et al.*, 2002).

There is a long and terrible record of environmental destruction and human rights violations in the oil-producing regions of Nigeria. The gross level of environmental degradation caused by oil exploration and extraction in the Niger Delta has gone unchecked for the past 30 years. Repression still continues. Evidence shows that the oil companies operating in Nigeria have not only disregarded their responsibility towards the environment, but have acted in complicity with the military’s repression of Nigerian citizens. The profit-driven collusion between multinational oil companies and the past and present Nigerian governments has cost many lives and continues to threaten the stability of the region (ANON, 1999):

- Oil corporations in the Niger Delta seriously threaten the livelihood of neighboring local communities. Due to the many forms of oil-generated environmental pollution evident throughout the region, farming and fishing⁵⁴⁰ have become impossible or extremely difficult in oil-affected areas and even drinking water has become scarce. Malnourishment and disease appear common.

⁵⁴⁰ One of the world’s largest wetlands and mangrove forests (Booker & Minter, 2003).

- The presence of multinational oil companies has had additional adverse effects on the local economy and society, including loss of property, price inflation, prostitution and irresponsible fathering by expatriate oil workers.
- Organized protest and activism by affected communities regularly meet with military repression, sometimes ending in the loss of life. In some cases, military forces have been summoned and assisted by oil companies.⁵⁴¹
- Reporting on the situation is extremely difficult due to the existence of physical and legal constraints to the free passage and free circulation of information. Similar constraints discourage grassroots activism.

The net result has been oil leaks polluting local water and damaging the fisheries (Binet, LeReste & Diouf, 1994; ANON, 1999), gas flaring that could be a source of energy for local communities, but which is dumping climate-impacting CO₂ into the air, resulting in acid rain (ANON, 1999).⁵⁴² Respiratory problems, coughing up blood, skin rashes, tumors, gastrointestinal problems, cancer and malnourishment are common ailments. Many children have distended bellies and light hair, which are evidence of kwashiorkor, a protein-deficiency syndrome. Residents attribute the spread of kwashiorkor to the drastic decline in fish catch and agriculture from the pollution of rivers, ponds, seawaters and land by oil industry operations. The Niger Delta has the third largest mangrove forest in the world and the largest in Africa. Mangrove forests are important for sustaining local communities because of the ecological functions they perform and the

⁵⁴¹ Repression by Sub-Saharan African governments and their appointed enforcers (e.g., safari, tourism and mining companies, government military and game officials) is common practice throughout the subcontinent (see Chapter 11, Section 11.11.5, Transfrontier Conservation Areas (TFCAs), Southern Africa and Section 11.11.6.2, Modern conservation and the Baka Pygmy and Section, 11.11.6.3, Failure to integrate Baka into managed bushmeat harvests and Section 11.11.6.13, Let the Pygmies be the guardians of the forest and Section 11.11.7.3, Collusion between WCS, CIB and unsustainable logging/conservation).

⁵⁴²AOPIG (2002) in recommendations to the U.S. Congress suggested that “U.S. companies should be encouraged to invest more in capping of flared gas flows, and African countries to move toward the establishment of a regional gas grid”.

essential resources they provide, including soil stability, medicines, healthy fisheries, wood for fuel and shelter, tannins and dyes and critical wildlife habitat (see Chapter 7, Section 7.9.7, Dam Impacts on Estuarine and Marine Fisheries). Oil spills are contaminating, degrading and destroying mangrove forests. Endangered species—including the Delta elephant, the white-crested monkey, the river hippopotamus and crocodiles—are increasingly threatened by oil exploitation. Since Shell came to Iko in Akwa Ibom State in 1974 to establish oil wells, repeated oil leaks have coated the breathing roots of the mangroves, killing off parts of the forest and the animal and marine life that depend on the detrital system linked to these trees. Women used to sustain their families through farming and trading in agricultural and other goods, but each of these is now extremely difficult with the effects of oil industry pollution (ANON, 1999). The adverse impacts of the petroleum industry on the environment and cultures are not unique to the Niger Delta. Perkins (2006) describes similar destruction among Amerindians in the Amazon basin.

“The international outcry at the hanging of Ken Saro-Wiwa and other Ogoni activists protesting the despoiling of their Niger Delta lands and other events have had bottom line impacts on the industry. Some estimates suggest that militancy and protest has cut onshore oil production by 33% (a third), 700,000 plus bpd, in 2001-3” (Gary & Karl, 2003).

The **main multinational oil companies operating in the region** are: 1) Shell (accounting for more than 40% of the volume of production), 2) Mobil and 3) Chevron, in that order. Other companies with significant presence in the Delta are the 4) Italian company, Agip, 5) France’s Elf-Aquitaine (commonly known as Elf⁵⁴³) and 6) Texaco. All of these companies operate on the basis of a joint venture with the Nigerian government (ANON, 1999). U.S. government agencies have increased cooperation with Nigerian authorities to manage disorder in the

⁵⁴³ Today called “Total”.

Niger Delta oil production through contracts with Military Professional Resources, Inc. (MPRI). MPRI is a U.S.-based security company that also has a contract with the Nigerian government to retrain its army – basically a mercenary group (Reno, 2000 *In: Cilliers & Dietrich, 2000*), now called Private Military Companies/Contractors (PMCs) that have become legitimized in modern Western society as part of the military-industrial complex that keeps raw resources flowing from the Third World to First World economies.

“The U.S. Defense Department, according to the details of the August 2000 (PMC) contract, was to pay half of the estimated \$US 8 million price tag, with the Nigerian government paying the other half” (Dare, 2002).

For the communities, oil companies are the most visible manifestation of central government operating joint ventures; oil installations guarded by federal police or soldiers and the rapid response from the federal or state government if there is any threat to oil production. They conclude that oil companies and the government is effectively the same thing. They accordingly make demands for greater revenue allocation and compensation for damage wrought by oil production—from the oil companies and government. They blame the oil companies and government for the repression. The communities are aware that oil companies are making large profits out of what they see as “their” oil and believe that these profits bring with them responsibilities towards the traditional landholders (Human Rights Watch, 1999). The same is happening all across Sub-Saharan Africa with other mineral resources, as well as timber, wildlife and fisheries. The winners are African elite and Western economies, while the losers are the rural Africans living in abject poverty among this incredible wealth.

A few individuals in their communities, the contractors (roughnecks on the oil rigs) and “traditional rulers”,⁵⁴⁴ have profited handsomely from oil production, while for the majority the land has become less fertile and fish catches have declined. Communities want compensation for loss of livelihood caused by land expropriations, oil spills and other effects of oil production, yet are forced to accept assessments of compensation valued by the oil companies with no meaningful way of obtaining an independent determination of their loss. The few school blocks and unfinished water schemes do not satisfy their view of what an “oil producing community” should look like. While most requests for compensation or assistance are settled peacefully, but often unsatisfactory, community members sometimes shutdown flow stations, take hostages, or commit criminal damage as political statements of their right to participate in the prosperity currently restricted to a small elite (Human Rights Watch, 1999; Booker & Minter, 2003).

The first responsibility for resolving these injustices lies with the Nigerian government. Yet the multinational oil companies operating in Nigeria cannot avoid their own share of responsibility. It is not enough simply to say that the political environment in Nigeria makes it difficult for the oil industry to alter government policy towards the oil regions. In fact, oil companies contribute toward discontent in the Delta, and to conflict within and between communities that result in repressive government responses. Companies have a duty to avoid both complicity and advantage from human rights abuses (Human Rights Watch, 1999).

⁵⁴⁴ The term “traditional ruler” in the 21st century is a misnomer, since many chiefs are no more than lowly paid government bureaucrats, having lost allegiance to their constituencies long ago (see Chapter 3, Section 3.1.4.1, Francophone colonial Africa and Section 3.1.4.2, Anglophone Africa and Chapter 11, Section 11.3, NEO-IMPERIALISM IN SUB-SAHARAN AFRICA and Section 11.4, ECONOMIC DEVELOPMENT AT INDEPENDENCE).

“ ‘At the end of the day, as over much of Africa land and resource tenure are the real issue. With colonialism and neo-colonialism - our own people taking control of resources undemocratically - it has led to communities losing their land to governments and corporations,’ said Oronto Douglas, deputy director of a group called Environmental Rights Action in Nigeria...To help avoid this, Mr. Douglas of Environmental Rights Action says local communities must have the right to control their resources. ‘What needs to be done in Nigeria and all of Africa is the need to ensure that all citizens have their rights protected,’ he said. ‘Citizens in Nigeria and the rest of Africa don’t have citizenship rights. The elite, a few people, grab power and decide for the majority. So what we’re saying is there has to be the institutionalization of democracy’ ” (Shiner, 2004b).

As discussed in some detail in Chapter 9 (see Section 9.7.2.1, Devolution through policy reform, land and resource tenure), this implies devolution of ownership and the right to economically benefit from the sustainable exploitation of land and resources to the level of local communities.

The oil fields of the Niger Delta and the diamond mines of Sierra Leone/Liberia have one thing in common – dispossessed young people who see the generation of global wealth under their noses and yet see little prospects for the future with little opportunity for education or job opportunities. In addition to immigrating to cities, where uneducated youth hustle or often turn to crime, “rural hot spots”, such as the Niger Delta and other mineral rich hot spots in the forests of Central Africa, serve as a boiling cauldron of discontent. Here, they fence stolen goods, trade in illegal guns and drugs, or partake in clandestine mining, among other activities. Nigeria has become a major international transshipment point in the global drug trade and in money laundering. Many of the rebels and malcontents are students who would rather be furthering their education and working than fighting, but there is little or no financial support from governments (Richards, 2002 *In: Zack-Williams, et al., 2002*). Likewise, these “hot spots” are also

centers of malcontent youth, easy recruits for terrorist organizations and rebel groups alike (see Section 13.3, CAPITALISM WITHOUT A CONSCIENCE).

Many ethnic groups in the Niger Delta have produced declarations and bills of rights that call for autonomy in the management and control of local natural resources. The survival of a large number of Niger Delta communities is now dependent on their ability to establish their entitlement to local resources. In 2004, a militant leader, Moujahid Dokubo-Asari, called for the region's secession as the only way to bring about control over the oil wealth that escapes the masses;

“ ‘The Nigerian state has deliberately impoverished our people...It is only violence that makes the tyrant listen,’ ” he says (Timberg, 2004a).

In April 2006, The Movement for the Emancipation of the Niger Delta (MEND) turned down President Olusegun Obasanjo’s offer of a \$1.8 billion highway through the vast wetlands region and 20,000 new jobs. According to MEND

“ ‘What we have demanded...is the control of our resources, which the Nigerian government has so far ignored’ ” (Ashby, 2006).

MEND is responsible for major attacks on oil installations that have resulted in a 25% decline in Nigeria’s oil production since early 2006, helping increase global oil prices (Simpson, 2007).

Delta youth leader and president of the Niger Delta Youth Council, Mike Ekamon, says,

“ ‘We own the land, we know our problems...You do not pick governors and ministers to come and instill power in the people. You pick those people. Call the youth’s proper. Call the *egbesus* (militants), those people you call militants, if you pacify them, the

problem will be put off immediately. But if you do not pacify them, they will continue fighting in the creeks' " (da Costa, 2006).

13.10.1.4 Petroleum war, Congo Brazzaville

"Congo Brazzaville is one of the petro-states most closely associated with the legacy of influence peddling and dirty deals in Africa by the now-notorious French state oil company Elf Aquitaine (now Total). Elf treated Congo as its colony, buying off the ruling elite and helping it to mortgage the country's future oil income in exchange for expensive loans. The company even financed both sides of the civil war, as it also did in Angola", (Global Witness, 2004).

In June/July 1996, the principal author was in Congo's capital, Brazzaville, now with rundown bullet pockmarked and mortared buildings, but once a beautiful town with whitewashed buildings, the headquarters of Charles de Gaulle and the Free French during WWII. One day while walking through town, soldiers armed with automatic weapons suddenly appeared and there riding in an open vehicle waving his hand was President Jacques Chirac of France. One might wonder what he was doing there, but expatriates living there knew the reason for his coming very well – one of the largest offshore oil fields ever found in the Gulf of Guinea had just been discovered and France's President was there to make sure Elf retained control over this country and its oil fields.

The economy of Congo is based almost entirely on the exploitation of its natural resource base. The petroleum sector dominates the economy (see Table 13.2: Economic dependence on oil by key African exporters, 2002) and because it borrowed heavily, based on oil collateral, this was responsible for a debt of US\$ 6.26 billion in the mid-1990s (MEF/NNP, 1995). It is unclear where this borrowed money went, since there is little sign of development. One can guess, as with much of the wealth in Sub-Saharan Africa, that it took an "overseas flight" into Swiss bank accounts of the power elite or homes on the Riviera, with

no accountability to the citizens of the Congo. As a result, according to the Forest Monitor (2001),

“Although Congo (Brazzaville) was the fourth largest oil producer in Sub-Saharan Africa in 1999 (IMF, 2000), the country remains highly indebted to International Finance Institutions (IFIs) and debt arrears continue to escalate. At the end of 1999, its total external debt amounted to CFA Fr 3,357 billion (US\$ 4.36 billion), equivalent to 246% of its GDP, with arrears of CFA Fr 1,279 billion (US\$ 1.66 billion)” (IMF, 2000).

This former French colony sits on top of the largest oil reserves in Africa and France considers it a cornerstone in “its temple of influence” (Madsen, 1999). Congo Brazzaville is currently Sub-Saharan Africa’s third largest oil producer after Nigeria, Angola (Gary & Karl, 2004) (see Figure 13.4: Oil production in Africa). Economic ambitions of Congolese leaders are regarded as one of the main driving forces of the civil war that followed. Competition for scarce resources has been made more desperate by the International Monetary Fund (IMF)’s insistence on budgetary austerity and cuts in the numbers and pay of civil servants (ANON, 2001a), better known as structural adjustment (SAP).

France’s *Chasse Gardeé*

The French company Elf controls 75% (3/4’s) of the Congolese oil production and, therefore, represents one of the main sources of income for this Sub-Saharan African country. The links between the French multinational and the country’s government are many, visible and invisible. Since Sassou Nguesso became President of the “People’s Republic” of Congo, the relations between the government and the company could not have been better (ANON, 1997).

U.S. Attempt to Displace French Domination

When U.S. educated (see Section 13.8.2.2, America declares the end of France's *chasse gardeé*) Pascal Lissouba took over as President in 1992, he began to open the country's oil industry to other firms, including (American-based) Occidental Petroleum, Exxon and Chevron, as well as Shell (Madsen, 1999; Ross, 2002). By 1994, American investment in the Congo, mainly in the oil sector, was US\$ 550 million, expected to rise to US\$ 1 billion within five years (*Washington Times*, 1995c). Lissouba's close relationship with the Americans infuriated France, which had just lost Rwanda to an American-backed and English-speaking regime that, along with Uganda, would soon be moving in to take over the Democratic Republic of Congo for the Americans. France decided at all costs not to let Congo Brazzaville fall to the Americans.

Elf supported Denis Sassou-Nguesso's bid to replace Lissouba in order to protect, or regain, its dominant position in the Congolese oil industry (Madsen, 1999; Musah, 2000 *In:* Musah & Fayemi, 2000; Ross, 2002); conversely, Sassou-Nguesso helped finance his bid for power by selling Elf access to future oil rights (Ross, 2002). In 1995, Mobutu Sese Seko (Overthrown May 16, 1997), who by then was pro-French and anti-American, worked with Elf to finance Sassou-Nguesso's forces, while the French military *attaché* in Brazzaville clandestinely shipped arms via Burundi (Madsen, 1999). Was Elf backing Sassou-Nguesso for commercial reasons, or acting on behalf of the French government for political reasons? Until 1994, Elf was a state-owned company and worked closely with the French government to promote French political interests in Africa. It was, however, privatized in 1994 and its new leadership adopted a more commercial approach to Elf's relations with foreign governments. Elf's involvement in the Congo war has been scrutinized in both the media and the French and Belgian courts; with no evidence to suggest that Elf's support for Sassou-Nguesso was on

behalf of, or at the direction of, the French government (Ross, 2002). Madsen (1999) seems to believe that there was French government involvement (see below).

Angola also sided with Sassou-Nguesso for two reasons. First of all, Elf is also one of the main companies exploiting the oil resources of Angola, but most importantly is that Angola's intervention in the Congo allowed it to smash a great deal of the remaining National Union for the Total Independence of Angola /*União Nacional Para a Independência Total de Angola* (UNITA) forces still operating from this country against the Angolan regime. After Mobutu Sese Seko's fall in 1997, Angola blamed Lissouba for being the sole supporter of UNITA and the Cabinda secessionist movement – the Front for the Liberation of the Cabinda Enclave/*Frente de Libertacao do Enclave de Cabinda* (FLEC) (Madsen, 1999).

With the ouster of Mobutu Sese Seko, Laurent Kabila's Democratic Republic of Congo (DRC - former Zaire and now an American puppet) sided in this war with Pascal Lissouba, early on in Lissouba's presidency, sending in a few hundred troops to put down Sassou-Nguesso's private militia. This could seem surprising, as this put him in opposition with Angola that supported his campaign to overthrow Mobutu Sese Seko in the former Zaire. This can only be understood in the context of the French-U.S. rivalry in Africa. Mobutu Sese Seko's overthrow was a blow against French interests in the area, while Laurent Kabila was supported by those countries in the U.S. sphere of influence (mainly Uganda and Rwanda). Kabila, therefore, chose to oppose France's interests in this conflict (ANON, 1997; Madsen, 1999). However, in a surprise turn around, Kabila, America's ally in the Democratic Republic of Congo, threw his weight behind Angola and Sassou-Nguesso. The Defense Intelligence Agency (DIA) of the U.S. realized that it had created a figurative "Frankenstein's monster" (Madsen, 1999).

Laurent Kabilas life span as a President of the Democratic Republic of Congo would be short-lived, catching an assassin's bullet. It would not be too hard to speculate who supported it and from where it came.

Shortly before the 1997 presidential elections, President Lissouba set about renewing his mandate regardless of the cost. Denis Sassou-Nguesso, after a seven month trip to France, also reassumed his responsibilities.

"The country's former strongman was already campaigning in both the north and the south of the Congo. A number of Congo Brazzaville's districts were mobilized to support him. Total anarchy reigned. Weapons were distributed and young people were recruited to swell the ranks of the 'Cobras,' the pro-Sassou-Nguesso militia" (ANON, 2002b).

Conflicting American Policies

Meanwhile, while American oil companies were being supported by Lissouba in accessing Congo Brazzaville's oil fields, support to Sassou-Nguesso was provided by American supporters, Maurice Tempelsman,⁵⁴⁵ a wealthy Belgian Jewish immigrant to America who had two diamond companies – Lazare Kaplan Inc. (supplied diamonds to Tiffany and Cartier) – and Leon Tempelsman & Son, as well as by American Mineral Fields owned by Jean-Raymond Boulle, a Mauritian *émigré* with British citizenship who operated out of President William (Bill) Jefferson Clinton's home town of Hope, Arkansas. This would make sense if the goal was to rid Angola of UNITA to allow them access to the diamond fields. Added to this support was the Military Professional Resources Inc. (MPRI), a U.S.-based PMC operating in Angola, headed by retired General Harry Soyster, former director of the Defense Intelligence Agency (DIA). MPRI contracts directly to the CIA and DIA – doing America's dirty work when it is of political

⁵⁴⁵ A long-time Democratic Party fundraiser (Ruppert, 2004).

expedience for the United States to avoid direct involvement (Madsen, 1999). Also linked to support of Luanda and its Brazzaville ally (Sassou-Nguesso) was Boston-based Citizens Energy International Inc. (CEII), a non-profit holding company of groups involved in oil hustling. Joseph Kennedy (son of Robert Kennedy and former U.S. Congressman) was the founder of CEII (Madsen, 1999).

Why was this dichotomy of Americans supporting both sides? The causes appear to have been: 1) A large intelligence bureaucracy with conflicting policies, 2) American factions in Angola supporting the ouster of Lissouba as a means of cutting off supply lines that would result in the demise of UNITA in Angola as a means of getting at its diamonds and oil and 3) Dropping a loser and going with the winner in order to save face and more importantly, have an outside chance of continuing to get some oil out of Brazzaville, even under French influence (Madsen, 1999) (see Section 13.10.1.5, Resource war – Angola oil and some diamonds - for more detailed discussions of these interests in Angola).

When the civil war broke out, the United States found itself supporting Angola on one hand (that was supporting Sassou-Nguesso) and on the other hand, directly supporting Lissouba (Madsen, 1999). Whores have many lovers. Because of Lissouba's ties to Occidental Petroleum, both the Defense Intelligence Agency (DIA) and National Security Agency (NSA) – both of the U.S. - provided Lissouba with high grade intelligence, while contributing US\$ 10 billion in weapons via Israel through Kampala to his cause (Madsen, 1999). Madsen (1999) believes this is what happens when the intelligence bureaucracy becomes too large and different agencies have conflicting policies.

In another strange twist, with the not-so-hidden hand of the U.S. (as in Rwanda), the United States refused to allow UN peace keeping forces to go into Congo

Brazzaville that would have helped keep Lissouba in power – one hand not knowing what the other was up to and/or was it what Madsen (1999) calls “Washington was playing an all-too-familiar double game in Congo (Brazzaville)”?

Meanwhile, the U.S. in 1997 began assisting Angola and Sassou-Nguesso with its paramilitary forces in Cabinda and stepping up pressure on UNITA, both actions allowing Luanda to divert more support to its campaign against Lissouba (Madsen, 1999). Was the handwriting on the wall? Since Lissouba was on his way out, was it better to help a winner than to back a loser? The collapse of Lissouba, in turn, cut the supply lines to Savimbi, resulting in UNITA’s rapid demise (Madsen, 1999). Thus, what had been a lose/lose situation for the U.S. became win/win; they helped get rid of Savimbi’s UNITA to access diamonds, while jumping on the bandwagon in hopes of getting some “Brazzaville oil crumbs” from Sassou-Nguesso and Elf whom they had originally tried to defeat. Madsen (1999) calls this a classical DIA double cross.

Civil War of 1997

In desperation, Lissouba visited Paris in September 1997, but President Chirac refused to meet with him or recognize him as President of Congo Brazzaville. Madsen (1999) estimates that France and Elf bankrolled Sassou-Nguesso to the order of about US\$ 150 million (Madsen, 1999)

“ The first four months of the war (in 1997) cost 10,000 lives, displaced 800,000 people, and destroyed much of Brazzaville, the capital city. Following a brief lull, war erupted again the following year, until a cease-fire took hold in November, 2000. The war began with a confrontation between government forces, loyal to President Pascal Lissouba, and the ‘Cobras’ a private militia of Denis Sassou-Nguesso who had been Congo’s President from 1979 to 1992” (Ross, 2002).

Lissouba also had his own private militia, the “Zulus” (Madsen, 1999). Lissouba was unable to find anyone to purchase US\$ 50 million in oil futures needed for arms purchases. He was rapidly losing the war and was perhaps too risky to bet on. Had he succeeded in selling the oil futures, the war may have been even longer and costlier than it was (Ross, 2002).

Denis Sassou-Nguesso’s military superiority won with support from Chad, Hutus from Rwanda and Angola. The fall of Pointe-Noire on the coast, economic capital of the country and the center of petroleum production, temporarily ended the civil war (ANON, 2002b). He also had support from French legionnaires, who had headquarters at Brazzaville’s Maya-Maya airport under the cover of evacuating foreigners, but really to help Sassou-Nguesso (Madsen, 1999). Madsen (1999) and Huliaras (2002 *In: Zack-Williams, et al.*, 2002) believe that France, which in June 1997 used its army to evacuate citizens from the country while remaining neutral to the civil war, was actually able to support opposition forces led by ex-President Denis Sassou-Nguesso, who favored French influence, and ultimately Elf as the main exploiter of petroleum on its continental shelf. France immediately recognized Denis Sassou-Nguesso as Congo’s legitimate President. This swift action, in contrast to the international community’s wait-and-see policy and veiled protestations, merely reinforced suspicions that France was guilty as charged – namely of supporting the short-term interests of the oil industry.

Before a Supreme Court, which he set up, Denis Sassou-Nguesso took the oath of office on 25 October 1997, combining the posts of President of the Republic, Head of Government, Defense Minister and Commander-in-Chief of the Armed Forces. His power consolidated, the constitution abolished and institutions dissolved, a government of former enemies was formed and a National Transitional Council was set up for elections based on a “single list”. Defeated,

Pascal Lissouba and the other presidential hopeful Bernard Kolelas left the country together with their personal bodyguards. A police state had replaced war, but peace had not yet been declared (ANON, 2002b).

“Denis Sassou-Nguesso’s party has only a restricted electoral base confined to the small population in one part of the river basin and plateaus regions and to the immediate north of Brazzaville. The south of the country, which is more densely populated, generally supported the opposition. The Nibolek (the Niari, Bouenza and Lekoumou regions in the west) was the fiefdom of Pascal Lissouba, while the Pool region and areas to the south of Brazzaville were traditionally linked to Bernard Kolelas. Only the capital, where its neighborhoods are divided along extreme ethnic lines, symbolized north/south opposition.

Unity in the two main subdivisions of the country is not seamless, which explains conflicts within the regions. Indeed, the minorities in the north willingly ally themselves with those of the south to try to gain overall control. From a cultural standpoint, differences between the Kongo-dominated south and the north, where the Mbochi and the river people have finally gained the upper hand over the Teke, are extreme. This two-way split in the country is further reinforced by the combination of spilt blood, communal vengeance and passionate ethnic division in public life. The bitter struggle for power, ultimately the only genuine key to economic wealth, has thus exacerbated division in Congo. It has also greatly handicapped any attempt at building or rebuilding national unity, a condition desired by most Congolese” (ANON, 2002b).

Although former senior Elf officials have been jailed in France for “ ‘misuse of company assets,’ ” their legacy endures. Despite huge existing debts and a supposed program of cooperation with the international community to restructure Congo’s finances, the Congolese government has entered into deals to avoid financial scrutiny from the international community and its own citizens. The national oil company *Société Nationale des Pétroles du Congo* (SNPC) makes a multi-million dollar profit, but, according to the IMF, does not pay a single penny of this money into the government’s coffers (Global Witness, 2004).

It becomes clear from this case study that Washington's and France's true interests lay not in the democratic process in Congo (Brazzaville), or for that matter in any other country in the region, but what lies underneath the African land mass and its coastal waters; diamonds, oil, gold, and other resources (Madsen, 1999). This is the tragedy of living in a country so richly endowed – the democratic process is not allowed to evolve as the superpowers vie for control of this wealth at the cost of Africa and its citizens.

13.10.1.5 Resource war – Angola oil and some diamonds

Until the 19th century, Angola served as a slave pool for Portugal's most lucrative economy, Brazil, while its metals and gemstones were plundered. The market dominant minority of 335,000 Portuguese colonialists ruthlessly ran Angola's economy, departing in mass when Angola was granted independence in 1975, taking with them the skills needed to run the country. They left Angola to disintegrate into a brutal civil war (Chua, 2003) that became ethnically divided as various impoverished ethnic groups in the guise of political movements such as the Popular Movement for the Liberation of Angola /*Movimento Popular da Libertaçāo de Angla* (MPLA), the National Union for the Total Independence of Angola /*União National Para a Independēcia Total de Angola* (UNITA) and the National Front for the Liberation of Angola/*Frente Nacional para a Libertaçāo de Angla* (FNLA), representing almost exclusively the Mbundu, Ovimbundu, and Baongo (Bakongo) ethnic groups, respectively. These groups vied to access the previously denied wealth of the country, while being used as pawns in the ideological Cold War chess game played out on the continent between the East and West.

“The war in Angola began in the 1960s as a struggle against Portuguese colonial rule. Shortly after Angolan independence in 1975, it turned into a battle between the government – Liberation of Angola /*Movimento Popular da Libertaçāo de Angoia* (MPLA), which was backed by the Soviet Union and Cuba, and the rebel National Union for the Total Independence of Angola (UNITA – *União Nacional para a Independência Total de Angola*), which was supported by the U.S. and South Africa. When outside powers withdrew their funding in the late 1980s and early 1990s, each side turned to the nation’s natural resources primarily oil and diamonds to fund its armies. By the time UNITA and the government signed a cease-fire in April 2002, at least 500,000 had been killed and 33% (one-third) of the population was displaced” (Ross, 2002).

Others say that between 1975 and 1991, 900,000 died - 90,000 killed or injured by mines and 1.7 million displaced out of a population of 12 million (Ostheimer 2000 *In:* Cilliers & Dietrich, 2000). The fundamental cause of the civil war in Angola is the division of power and wealth along ethnic lines (Malaquias, 2000 *In:* Cilliers & Dietrich, 2000).

Oil Revenue

Oil revenues in Angola are expected to increase to US\$ 12 billion annually by 2005 (Clarke, 2000 *In:* Cilliers & Dietrich, 2000). About 70% of Angola’s 1998 oil production of 760,000 barrels a day (see Figure 13.4: Oil production in Africa) was exported to the USA, providing the MPLA with 60% of its total revenue (Reno, 2000 *In:* Cilliers & Dietrich, 2000). The production of 770,000 barrels of oil a day accounts for 90% of the country’s exports, 80% of government revenues and over 40% of Gross Domestic Product (GDP) (see Table 13.2: Economic dependence on oil by key African exporters, 2002). It is expected to reach one million bpd in the near future. Angola is the sixth largest supplier of crude oil to the United States and is expected to increase from 7% to 10% of crude imports

within the next eight years. Foreign companies, including Chevron, TotalFinaElf, Texaco, BPAmoco, Exxon Mobil, Occidental Petroleum and Royal Dutch Shell, have invested about US\$ 8 billion in Angola (Dietrich, 2000 *In: Cilliers & Dietrich, 2000*). Gary and Karl (2003) estimate

“more than 40% of its oil is exported to the U.S. market, and production is projected to increase to 2 billion bpd by 2008. ChevronTexaco, Angola’s largest oil producer, is currently pumping more than 500,000 bpd, and Total, ExxonMobil and BP are also heavily invested. Like Nigeria, Angola’s oil dependence is legendary — from 1995 to 2001, oil tax revenues comprised 70-90% of state revenues and over 60% of GDP. More than 97% of Angola’s oil is drilled offshore, so there is little interaction between companies and local communities” (see Table 13.2: Economic dependence on oil by key African exporters, 2002).

“Oil revenues and oil-backed loans from foreign banks between the state oil company Sonangol, the palace, and the central bank, create a ‘circuit’ which has funded arms purchases of up to US\$ 1 billion/year” for the Angolan government (de Beer & Gamba, 2000 *In: Cilliers & Dietrich, 2000*).

Most of the money from oil experiences overseas flight by the oil companies or into Swiss bank accounts by the political elite and generals who control the country (LeBillon, 2000 *In: Celliers and Dietrich, 2000*).

“Bilateral actors (e.g., Western donors/governments) are inclined to accommodate domestic anti-reform interests in order to secure commercial benefits, particularly for their Transnational Corporations (TNCs)” (LeBillon, 2000 *In: Celliers and Dietrich, 2000*).

Guest (2004) explains that the civil war in Angola provided an excuse for secrecy in the name of national security, which made it easy to pocket kickbacks from arms deals or to funnel the money directly into offshore accounts of the elite. So why have peace? Though by now, the elite are so rich they can “afford” peace.

Poverty among Plenty

Meanwhile, the state of Angolan poverty is acute, with low and falling incomes, chronic unemployment, massive deficits in health and education, poor infrastructure and high infant mortality (Clarke, 2000 *In: Cilliers & Dietrich, 2000*). About 25% (one in four) of Angola's children die before the age of five and 1 million Internally Displaced Persons (IDPs) remain dependent on international food aid (Global Witness, 2004). Little or nothing goes into development. It could be argued that anarchy and instability, if controlled by the exploiters, maximizes profits. This is good capitalism. As currently practiced, capitalism has no morality other than profit maximization.

Foreign Aid Creates De-Linked Government

A good overview is “Angola’s War Economy, The Role of Oil and Diamonds” (Cilliers & Dietrich, 2000). This book explains that Angola is controlled by big American and French multi-national petroleum concerns and diamond merchants who pay off both sides, such as the French oil company Elf Aquitaine (Le Billon, 2000 *In: Celliers & Dietrich, 2000*); cheaper to pay off the President, a few generals in MPLA, and the UNITA hierarchy than an entire country. Angolan political elite have “de-linked” themselves from the plight of the masses. This de-linkage is fueled by “war aid agencies (NGOs)”, supported by Western donors such as USAID, that provide “government services” through NGOs such as CARE, World Vision and the Catholic Relief Services or the UN sponsored World Food Program (WFP); in essence, public service contractors and, one could argue, instruments of U.S./Western foreign policy, which negate the need for the government to be responsible to its citizens (Ostheimer, 2000 *In: Cilliers & Dietrich, 2000*) (see Chapter 11, Section 11.7, FOREIGN AID IN GENERAL).

One might ask, as in Zimbabwe, does this aid (especially food aid) help prolong the anarchy that exists, allowing investment in war instead of peace? Angola has been transformed from a one-party state to a presidential regime and a few generals (Cilliers, 2000 *In: Cilliers & Dietrich, 2000*) at the expense of its citizens.

Switch-Hitting by the USA

The U.S. political tilt in recent years towards the Marxist MPLA-led dos Santos government and away from Jonas Savimbi's UNITA has many roots and perhaps control of oil interests is one of these elements (Madsen, 1999; Clarke, 2000 *In: Cilliers & Dietrich, 2000*). The CIA plan to kill Savimbi reportedly had backing of U.S. oil interests who wanted to block UNITA's attempt to spread conflict to oil-rich Cabinda, possibly linking up with the Cabindian secessionist movement, Front for the Liberation of the Cabinda Enclave/*Frente de Libertacao do Enclave de Cabinda* (FLEC) (Madsen, 1999).

Joseph Kennedy [son of Robert Kennedy and former U.S. Congressman was the founder of CEII (Boston-based Citizens Energy International)]. His brother Michael ran CEII while Joseph was in Congress and founded the U.S.-Angola Chamber of Commerce that at one time supported UNITA. The Chamber, consisting of major American-based oil companies (e.g., Gulf Oil, Chevron and Texaco) turned against UNITA and pressured President George Bush Sr. to drop his support. Savimbi was on his way out, whether he knew it or not, even after the September 1992 elections when the MPLA and UNITA were forced into power sharing. American oil and mineral interests wanted Savimbi (UNITA) out, which by then supported President William (Bill) Jefferson Clinton's foreign policy of recognizing the MPLA. Joseph's and Robert's uncle, Senator Edward Kennedy, sponsored a Senate bill calling for sanctions against UNITA and on

September 23, 1993, President Clinton signed an Executive Order that the long sustained and CIA-supported UNITA movement was a “continuing and unusual extraordinary threat”. Both Mobutu Sese Seko and Lissouba continued providing Savimbi support until their ouster (Madsen, 1999). Another pawn had expended his usefulness to the Western political-industrial establishment and would soon be eliminated. At the same time, the American-Canadian mining company, American Mineral Fields (AMF), wanted the UNITA guerrillas out of the diamond fields so that it could reap the profits, beating De Beers from South Africa to the punch (Madsen, 1999).

Employment of Private Military Companies/Contractors (PMCs)

The foreign investors, together with non-African officials (e.g., Western governments and their multi-national firms), have a vested interest in ensuring that Angola’s government is secure and stable by helping Angola’s regime gain access to services of other private firms (e.g., Private Military Companies/Contractors (PMCs) (Reno, 2000 *In: Cilliers & Dietrich, 2000*) such as Executive Outcomes (EO),⁵⁴⁶ Saracen, Falconer Systems of South Africa and its British-based sister company Sandline, Saracen, as well as Wackenhut⁵⁴⁷ and MPRI – both U.S. based – (Madsen, 1999) that assist in tasks conventionally associated with states; warfare and diplomacy that help depress internal challengers (e.g., UNITA). Likewise, links between Washington and the International Defense and Security (IDAS),⁵⁴⁸ a private Netherlands Antilles company have been raised, as well as initial financial support by Jean-Raymond Boulle in Angola to cut off supply routes to Jonas Savimbi’s UNITA along the

⁵⁴⁶ Prior to the ouster of Savimbi/UNITA, the principal author, living in South Africa met a mercenary working for Executive Outcomes (EO), guarding the diamond fields for UNITA – both sides using mercenaries.

⁵⁴⁷ The Wackenhut Corporation, 4200 Wackenhut Drive, Palm Beach Gardens, Florida USA 33410-4243, Tel.: 561-622-5656, <http://www.wackenhut.com/>.

⁵⁴⁸ Address not found.

Democratic Republic of Congo's border. Boulle's America Mineral Fields eventually bought IDAS outright (Peleman, 2000 *In:* Musah & Fayemi, 2000).

These foreign Private Military Companies/Contractors (PMCs) provided MPLA with access to channels for foreign aid, export guarantee schemes, loans to foreign investors and diplomatic support for the investment strategies of individual firms. Oil, attracts far greater resources from foreign states, both diplomatically and commercially, than diamond mining (Reno, 2000 *In:* Cilliers & Dietrich, 2000). In some cases, PMCs act as facilitators in arms purchases (LeBillon, 2000 *In:* Cilliers & Dietrich, 2000). Madsen (1999) demonstrates how these PMCs, basically mercenaries legitimized by both Western and African governments, are used throughout the continent by both Western interests (e.g., oil and mining companies, as well as Western governments) and African governments to achieve strategic objectives. This is often related to controlling access to natural resources where official intervention might be considered politically sensitive, especially if the press and/or human rights groups got a hold of such information.

Multinationals Drive Angola's Economy

A handful of major multinationals drive the economy and safeguard the government from military defeat (Dietrich, 2000 *In:* Cilliers & Dietrich, 2000). One of these, Halliburton, has ties that assist the firm to protect its own assets and by extension help the MPLA government to procure military services and intelligence, even if the firm's directors do not play a direct role in these affairs. Brown and Root, an engineering and logistic firm (which provided services to U.S. military forces in Somalia in 1993) is a subsidiary of Halliburton. Richard Cheney, currently Vice President of the United States under George W. Bush and U.S. Secretary of Defense from 1989-1993, until recently was the Chief Executive Officer (CEO) and Chairman of Halliburton. Halliburton, with Export-Import

Bank assistance, controls activities in the Cabinda enclave that is protected by Airscan,⁵⁴⁹ a security firm employing former U.S. military personnel. Amoco, Elf, Exxon, Marathon and Statoil procured financial and technical capabilities to explore for and extract oil in deep-water concessions in joint venture with Sonangol (which holds 20% equity shares). The inclusion of additional firms such as Prodev, Naphta and Falcon Oil raise suspicions that these joint ventures mix oil production with arms purchases (Reno, 2000 *In: Cilliers & Dietrich, 2000*). Oil has literally destroyed the Nigerian economy and corrupted its leadership and Angola seems to be heading in the same direction, with the MPLA mortgaging its future oil production for cash up front, mainly to purchase arms (*Cilliers, 2000 In: Cilliers & Dietrich, 2000*).

The role of “broker” between the Angolan government and international community will yield few results unless multinationals are willing to address human rights, the environment and corruption. Since the MPLA is not transparent, the oil companies operating in Angola must demonstrate complete transparency (*Dietrich, 2000 In: Cilliers & Dietrich, 2000*) (see Section 13.12.1, “Publish What You Pay” an Attempt at Developing Transparency in Distribution of Wealth from Africa’s Natural Resources).

MPLA Largest Arms Supporter in Southern Africa

The MPLA government is the largest arms purchaser in southern Africa, spending an estimated US\$ 5 billion on weapon imports during 1993 and 1994. Because arms procurement strategies are hindered by Angola’s US\$ 12 billion external debt, the MPLA instead uses oil revenue gained through taxes, signature bonuses, royalties and payments to the national oil company, Sonangol, not being open to

⁵⁴⁹ AirScan Inc., 7017 Challenger Avenue, Titusville, Florida 32780, Tel: 321-268-9922, Fax: 321-256-9018, email: info@airscan.com and website: <http://www.airscan.com/>.

outside scrutiny, to buy arms or lubricate corrupt procurement mechanisms (Dietrich, 2000 *In: Cilliers & Dietrich, 2000*).

While most arms are flown in from Eastern European suppliers, not all stop in Angola. Weapons flow out of Angola into northern Namibia and Zambia. The symbiosis between the conflict in Angola and that in the Democratic Republic of Congo, Rwanda, Uganda, northern Namibia and western Zambia is such that the movement of small arms, ammunition and other commodities are exchanged for resources such as diamonds, endangered species and rare woods. These movements are facilitated by the existence of increasingly well-organized transnational criminal organizations (de Beer & Gamba, 2000 *In: Cilliers & Dietrich, 2000*).

Blood Diamonds and UNITA

“Diamonds had made UNITA so rich that nothing that donors could offer would matter, while renewed predation offered massive rewards” (Reno, 2000 *In: Cilliers & Dietrich, 2000*).

De Beers in the past bought Angolan diamonds supplied by UNITA. Under criticism from Global Witness, De Beers announcement on 5 October 1999, that it would stop buying all Angolan diamonds, except those it was contractually obliged to purchase and has recently announced it would issue written guarantees that its diamonds did not originate from African rebels, that its stones are ‘rebel free.’ (Dietrich, 2000 *In: Cilliers & Dietrich, 2000*).

Now that Savimbi, the opposition leader cum guerrilla fighter, is dead (some say taken out by paid mercenaries on February 22, 2002) (*Africa Confidential, 2002b*), it will be interesting to see if the war ends, if others will pick up where Savimbi left off and how the wealth of Angola will be used in the future – to buy

implements of war, or to arm its people with education – something that the ruling elite may fear more than an AK-47, since this could lead to demand for accountability by its citizenry.

Corruption Continues in Post-Savimbi Era

Corruption continues. Global Witness (2004), says new evidence from IMF documents and elsewhere confirms previous allegations that over US\$ 1 billion per year of the country's oil revenues - about a quarter of the state's yearly income - has gone unaccounted for since 1996. Fletcher (2003) estimates that

“80–90% of Angolan government revenues come from the oil industry, but up to 40% of gross domestic product (GDP) in some years has bypassed the treasury and is channeled into hidden funds...Angola’s oil revenue accounts have been rendered even more opaque by the practice of paying for foreign bank loans with future oil cargoes, which has allowed for the diversion of state funds to irregular ends”.

“Oil firms plan to invest \$US 23 billion in Angola over the next 5 years, so this area is potentially a vast ‘black box’ in which oil service companies are only supervised by host governments and oil companies collaboration in hiding revenue flows in this arena is highly likely” (Transparency International, 2004).

Political and business elites in France, Angola and elsewhere exploited the country's civil war to siphon off oil revenues. There is evidence from a Swiss investigation of millions of dollars being paid to President dos Santos. The dos Santos government continues to seek oil-backed loans at high rates of interest, financed through opaque and unaccountable offshore structures. A major concern exists that Angola's elite will switch from wartime looting of state assets to profiteering from its reconstruction (Global Witness, 2004).

Corporate Responsibility

“Multinationals have a significant role to play in ushering in the changes that have been long overdue. The multinationals must be committed partners. Should they fail as corporate citizens, and foreign governments fail to broker peace and prosperity, it will be up to the consumers and the broader civil society to raise awareness and enforce accountability” (Dietrich, 2000 *In: Cilliers & Dietrich, 2000*).

However, to date the multi-nationals have refused to “Publish What You Pay” because of threats by the Angolan government to cut future multi-billion dollar contracts (Fletcher, 2003) (see Section 13.12.1, “Publish What You Pay” an Attempt at Developing Transparency in Distribution of Wealth from Africa’s Natural Resources).

Impacts of Angolan War on Wildlife

The status of large mammals in Angola’s protected areas declined by 90% during the 1970s and 1980s (Anstey, *pers. comm. In: Koch, 2004*; Huntley & Matos, 1992 *In: Koch, 2004* both *In: Fabricius, Koch, Magome & Turner, 2004*). Recent research indicates that remnant populations of the giant sable (*Hippotragus niger variani*) exist in central Angola that if protected could build up to viable herds.

13.10.1.6 Oil-scorched earth Sudan

“Our country is poor and in need of economic development. However, oil is not contributing to the development. We witness this displacement of our flocks from their homelands, driven away by helicopter gunships, Antonov bombers and government troops and militias in order for oil companies to work in relative security. Private companies, like any other organ in the society, are obliged to abide by and promote respect for the principles of the Universal Declaration of Human Rights”. (Catholic Bishops of Sudan, 2001 *In: Gary & Karl, 2003*).

Sudan has proven oil reserves of over one billion barrels and prospects of an additional 1- 4 billion barrels (Danforth, 2002).

“The exploitation of long-known oil reserves in Sudan has only added to fuel to the fire of the country’s long running civil war. Over 2 million have died and 4 million have been displaced during the last 20 years of the war...Sudan earned over \$300 million from oil in 2000 and greater sums still in 2001 and 2002. Government take in certain blocks is as high as 80%. Over the next 20 years, the PFC Energy consulting firm estimates that the Sudanese government may receive up to \$30 billion in revenues” (Gary & Karl, 2003).

Between 2004 and 2012, Sudan could collect as much as US\$ 30 billion in oil revenue with the potential for much more if exploration succeeds (Goodman, 2004).

Ethnicity and Religion

Northern Sudan is predominantly Muslim and the south is predominantly Christian. The Muslims make up 85% of the country’s population, with the remainder being Christian, Animist, Hindu and Jewish. Islam is not necessarily connected with the Arabic language. According to a 1955/56 census, the Sudanese ethnic composition was a 39% mix of Semitic migrants and indigenous Negroid Arabs, 36% Nilo Hamitic and Sudanese Negroid, 6% indigenous Negroid with some Semitic and Hamitic elements (Nuba and Nubians) and the rest are indigenous Negroid Funj (1.7%) and West African migrants (7%). In Sudan there are 132 tribes and sub-tribe groups. While people of African origin dominate the south, western and eastern Sudan, those of Arab origin are in the north and the mixed tribes are in the center (Sin & Takana, 2002).

Historical Reasons for Conflict

There are historical reasons for the war that are political, cultural, military and religious, dating back to foreign interference of 1821 when Mohamed Ali from Egypt moved southwards to Sudan and after that, the British conquest of Sudan.

Much of the blame for Sudan's current problems, in addition to the struggle for control of natural resources, can be attributed to British "divide and rule policies". Britain's anti-Islamic policies resulted in a separation of the Islamic north from the animist and what was to become Christian south. Britain saw a Christian south as a buffer to the rest of its colonies (e.g., Kenya and Uganda) against the spread of Islam. American and British missionary schools were established in the south. The south was declared a "closed district" by the British to northern Sudanese, while Christian, Greek and Syrian merchants were welcomed. The southerners called the northern Arabs non-Sudanese, while the northerners called the southerners, *Abid* or slave. After half a century, by the mid-20th century, in one country there existed two mutually antagonistic nations divided by language, religion and ethnicity, with these animosities of the 19th century encouraged to fester not heal (Harden, 1991). When the British left, the problem had already started. Since 1953, these differences were not corrected by previous Sudanese governments. Fighting between the north and the south began even before independence in 1956 (Harden, 1991), continuing almost uninterrupted until 2003, while peace negotiations continued.

The South requested the implementation of a federal system of government that was considered a taboo – separation. The thinking of the rulers in Sudan was to create a homogeneous Sudan, in which two twin policies were advocated: 1) Arabization and 2) Islamization. This did not succeed. The south requested self-rule, which was implemented from 1972 to 1983, at a time when there was

relative peace in the country, but then it was destroyed by the very ruler who brought it about (Executive Intelligence Review, 1998).

Gaafar Numeiri, who took over in a military coup in 1969, was initially supported by the U.S. with US\$ 1.5 billion in aid despite his repression as a counter-weight to pro-Soviet Gaddafi of Libya and Mengistu of Ethiopia. In 1983, he declared an Islamic revolution, throwing the country once again into civil war (Meredith, 2004).

Conflict

Conflict has consumed the country for 34 of its 45 years of independence and remains the only constant factor in this sprawling country of 36 million people covering a territory about the size of Western Europe, especially since the civil war resumed in 1983, rivaling that of any seen since World War II. An estimated two million people have died as a result of the fighting over the past 18 years, victims of direct violence or related starvation and disease. Half a million refugees have spilled into neighboring countries and roughly four million people have been displaced and driven from their homes within Sudan – the largest such dislocation in the world today (ICG, 2002; Goodman, 2004).

The main warring parties – the Islamist government and the opposition Sudan People's Liberation Army (SPLA) – have shown little interest in a serious peace process until recently. The government has pursued a “divide and conquer” strategy through intensive efforts to sow conflict among southerners (ICG, 2002).

U.S. and IFIs Involvement in Conflict

“Uganda provides a good example. Uganda is at war on three fronts and a significant percentage of the IMF/WB funding which has gone into Uganda has been diverted for military objectives. The banks, which fund Uganda through the international monetary institutions, are often associated with the multinationals involved in the plunder of raw materials. Uganda has supported the Sudan People’s Liberation Army (SPLA) war in southern Sudan, and I took testimony from Uganda dissidents who insist that U.S. military advisors have worked with the SPLA and Ugandan People’s Defense Forces (UPDF) against Khartoum” (Snow, 2001 *In: McKinney, 2001*).

Madsen places the U.S. plan to overthrow the Khartoum government as 1994 under the Clinton administration, when Eritrea, Ethiopia and Uganda began supplying Sudan’s rebels with arms, bases and logistical support, with the U.S. supplying US\$ 20 million in “non-lethal” military aid (Madsen, 1999). Madsen (1999) speculates that USAID, with strong ties to the CIA/Intelligence community, used the old CIA Airline, Southern Air, to funnel both arms and food aid to the SPLA through Western NGOs (see case study, Chapter 11, Section 11.8.6, Food Aid and NGOs in Sudan). This continued in 1998 with the bombing of the Al Shifa pharmaceutical plant in Khartoum by the U.S. because of its alleged production of VX nerve gas and supposed terrorist links to Osama bin Laden, neither of which has been proven. This came at a time when Khartoum was supporting the Democratic Republic of Congo’s Laurent Kabil, which America had decided to depose (after putting him in power with Ugandan/Rwandan and Tutsi-led Congolese troops), while the U.S. backed the SPLA, along with Khartoum peace talks that had collapsed (Madsen, 1999).

John Garang, with a PhD⁵⁵⁰ in agricultural economics from the Iowa State University, also received military training at Fort Benning, Georgia (Meredith, 2004; Thibodeaux, 2005), as U.S. allegiances changed from the north to the south.

A small window for peace opened because of the shock effect of the 11 September (2001) terror attacks in the United States (U.S.) and their impact on policy debates within the Khartoum government (a difficult economic situation), as well as the increasing desire of the Khartoum authorities to escape international isolation and enjoy their new oil wealth. The U.S. Government, by appointing distinguished former Senator John Danforth as Special Envoy, showed some willingness to become more engaged (ICG, 2002).

Oil Reserves Reshape Sudan's Civil War

The discovery of oil reserves in the south and serious production in 1999 reshaped Sudan's civil war. The Sudan People's Liberation Movement (SPLM), supported by the Sudan People's Liberation Army (SPLA), regards oil as a southern endowment that the government has forcibly exploited to finance a war strategy that relies increasingly on expensive, highly lethal weapons. The reconciliation between SPLA/SPLM rebel leaders John Garang (Dinka ethnic group) and Riek Machar (Nuer ethnic group) (in 2007, Vice President of Southern Sudan) was seen by the Sudanese government as a serious Nuer-Dinka threat to oil fields, justifying a military response, including attacks on civilians. Any peace process needed to address the oil issue in order to resolve a major cause of conflict and to serve as the basis for a just peace (Danforth, 2002).

In the oilfields of Sudan, civilians have been killed and raped, their villages burnt to the ground; caught in a war for oil, part of the wider civil war between northern and southern Sudan that has been waged for decades (Christian Aid, 2001).

⁵⁵⁰ Received a bachelor's degree in economics from Grinnell College, Iowa (Grinnell College, 2003).

A network of Western and Asian companies provides the critical expertise, finance and technology for Sudan's oil industry. Talisman Energy (Canada), Petronas (Malaysia), China National Petroleum Company (CNPC) (see Section 13.8.5, China in the Back Door), Lundin (Sweden) and OMV (Austria) have built production and refining facilities and financed the building of the 1,600 km pipeline taking petroleum from the oil fields to the Red Sea. Royal Dutch Shell built a refinery at Port Sudan. Chinese companies built the pipeline using materials that were supplied by the European company, Europipe, owned by Mannesmann (Germany), British Steel (now Corus) and a French company. Pumps of Glasgow and Allen Power of Bedford were awarded the contract to produce pumps and drivers in January 1998. Rolls Royce provides diesel engines and expatriate engineers to maintain them. The governments of Canada, China, Malaysia, Austria, France, Qatar and Sweden have companies (state owned and private) directly involved in Sudan. U.S. sanctions prohibit trade between the U.S. and Sudan, as well as investment by U.S. businesses in Sudan (though apparently not clandestine military arms and support), due to the Sudanese government's alleged sponsorship of terrorism and poor human rights record (Christian Aid, 2001). Due to public pressure, Talisman has pulled out (Goodman, 2004).

The presence of international oil companies is fueling the war. In the name of oil, government forces and government-supported militias are emptying the land of civilians, killing and displacing hundreds of thousands of southern Sudanese using oil industry infrastructure – the same roads and airstrips that serve the companies. In retaliation, opposition forces have attacked government-controlled towns and villages, causing further death and displacement. The Sudanese government itself now admits that oil is funding the wider civil war. A report by Washington-based Center for Strategic and Investment Studies concludes that: "Oil is fundamentally changing Sudan's war" and calls for the U.S. to enlist the

support of the UK government in an effort to end the war. The oil companies remain largely silent (Christian Aid, 2001).

Sudan, which two years ago was an oil importer, is now an exporter of oil and, with oil money, is able to fund an expansion of the war (Christian Aid, 2001). Of the US\$ 500 million received in oil revenue by Sudan in 1999, 80% went to buy weapons (Goodman, 2004), while from 1998-2002 the military budget doubled (Christian Aid, 2001; Goodman, 2004). China has established three weapons factories around Khartoum and is Sudan's largest supplier of arms (Goodman, 2004). This is alluded to in the description of a new industrial complex in the north that is reported to be used for dual civilian-military use (Christian Aid, 2001). Companies such as Lundin, Petronas and CNPC have contributed to the extension of the war by permitting government forces to clear new areas for them to exploit. The offensive, which will be necessary to take control of TotalFinaElf's concessions, will take the scorched earth close to the borders of Uganda and Kenya (Christian Aid, 2001), mostly of the Nuer and Dinka tribes, creating a *cordon sanitaire* around oil fields unless a peace treaty is signed.

Peace on the Horizon?

The broad strokes of a peace deal could potentially include the following fundamental compromises (ICG, 2002):

- “A federal constitution neither based on religion nor labeled secular, with each regional entity or state able to craft its own laws;
- A symmetrical federalism (with a higher degree of autonomy for the south) during an interim period, backed by credible international guarantees, with mutually agreed bench marks that if not met would trigger a self-determination referendum for the south and;
- An internationally monitored mechanism for wealth sharing that ensures that all sides benefit from implementation”.

A peace agreement was signed on May 26, 2004 in Naivasha, Kenya between the SPLA and the government of Sudan, through the Inter-Governmental Authority on Development (IGAD), an intergovernmental body of east African countries in an attempt to bring peace to this prolonged war. Even if the SPLA and northern Sudanese government come to terms, civil unrest is far from over as other rebel groups that are not involved in the peace talks appear on the horizon in the Darfur region, an area the size of France with an estimated four million people and a 1,000 km border with Chad (Human Rights Watch, 2004b). In a September 2004 interview, Garang (Bowman, 2004) explained that only the successful implementation of a comprehensive peace agreement will solve Sudan's woes, including the problems in Darfur (see Chapter 5, Section 5.11.4, Darfur, Sudan, overpopulation, desertification, ethnicity, conflict and politics).

Talks between the SPLM and the Sudanese government have yielded a basic framework for a power-sharing agreement, but issues remain to be settled and the talks are on hold. Until the accord is finalized and put into practice, Sudan's troubles will continue. Garang believes

“ ‘the solution is to have a new government in Khartoum. It is this government of national unity that will have the correct frame of mind and the necessary political and moral will and capacity to address the issue of Darfur’ ” (Bowman, 2004).

This occurred in July 2005 as John Garang was sworn in as Sudan's first Vice-President, signing an interim constitution for the next six years, ending 22 years of war that killed two million people and displaced four million more. After six years, a referendum will be held allowing the south to determine if it wishes to continue as part of the Sudan government. Hurdles still to be covered include (Majtenyi, 2005):

- Formation of a cabinet;
- Disbanding of southern militias; and
- Dealing with the Darfur crisis in western Sudan (see Chapter 5, Section 5.11.4, Darfur, Sudan, overpopulation, desertification, ethnicity, conflict and politics).

On Saturday, July 30, 2005, John Garang died in a helicopter crash returning from a visit to President Museveni in Uganda. Although deputy SPLA chairman Salva Kiir Mayardit, vowed to continue with the peace initiative (Thibodeaux, 2005), an already fragile peace has become even more fragile with the loss of this charismatic and visionary leader. U.S. Congress is concerned that a failure to find a solution to the Darfur conflict could result in an unraveling of the peace between the north and the south, while implementation of the Comprehensive Peace Agreement (CPA) between the north and the south, signed in 2005, is critical to ending the violence in Darfur (Robinson, 2005). Meanwhile, on May 5th 2006, a fragile peace agreement was signed between the main Darfur rebel group Sudan Liberation Movement/Army (SLM/A) and the Sudanese government. However, rival factional leader Abdel Wahid Mohammed al-Nur and another rebel group, Justice and Equality Movement (JEM), refused to sign leading the International Crisis Group (ICG) to conclude that there will be no peace in Darfur (Sudan Tribune, 2006b). He has also refused to attend the planned peace talks late 2007 peace talks in Libya (see Chapter 5, Section 5.11.4, Darfur, Sudan, overpopulation, desertification, ethnicity, conflict and politics). The fact is such treaties are short-term quick fix “feel good” actions that do nothing to mitigate the low resource to human population ratios, especially land, water and grazing. Unless Sub-Saharan Africa is helped to modernize, meaning urbanizing and industrializing to the point that significant human pressures are taken off the rural base, the genocides of Darfur and Rwanda and the conflicts and civil wars seen in places like the eastern DRC, central Nigeria, the Niger Delta, Kenya and the Ivory

Coast are just the beginning and indicative of what the future holds for the subcontinent.

The United States remains willing to celebrate a final north-south peace deal with a White House ceremony and to move to full political relations with Sudan. However, the U.S. still maintains economic sanctions because of Sudan's continued listing by the U.S. State Department as a state sponsor of terrorism, though cooperation in this matter has improved since 2001 (Gollust, 2004). U.S. Congress wants no normalizing of relations with Sudan until the Darfur conflict is resolved and are concerned about the upgrading of Sudan's rating in U.S. report on human trafficking (Robinson, 2005).

Meanwhile, as Darfur drags on with no obvious solution in sight (see Chapter 5, Section 5.11.4, Darfur, Sudan, over-population, desertification, ethnicity, conflict and politics), the Sudan People's Liberation Army (SPLA) accused the ruling National Congress Party of Sudan of violating the Comprehensive Peace Agreement (CPA) by maintaining huge forces in Southern Sudan, oil revenue, failing to restructure the civil service so that it is apolitical, and failing to reform draconian laws that suppress freedom of speech and the press. Although part of a government of national unity, in which Southern Sudan has 28 percent of the power; the National Congress retains 52 percent, and other parties 22 percent, Southern Sudan is negotiating bilateral agreements with the U.S. to drop sanctions against the South, while maintaining them against the north (Butty, 2007b; VOA, 2007). In mid-October 2007, the The Sudan People's Liberation Movement (SPLM) appeared to pull out of the unity government stating that its 18 ministers in central government would not report to work until the above issues are resolved (VOA, 2007). Peace between north and south, as well as Darfur is far from being achieved, and fragile at best.

Peace, if it comes, will be a mixed blessing depending on the stakeholder. China will have to compete with more Western oil companies and the SPLA, whose rebel held territories contain 40% of known oil reserves worth more than US\$ 16 billion, say they will seek to punish China for its support of the Khartoum government (Goodman, 2004).

13.10.2 Conflict Diamonds in Africa

Diamonds are an important portion of the GDP for a number of Sub-Saharan African countries (Table 13. 3). The United Nations brokered the “Kimberley Process” diamond certificate program to stop the illegal trade in rough “conflict diamonds”. Conflict diamonds have been primarily associated with Angola, the Democratic Republic of Congo, Liberia and Sierra Leone, where warring groups have funded their battles with proceeds from diamond sales.

Table 13.3: Economic importance of diamond trade to major African producers

COUNTRY	VALUE % GDP
Countries With Alluvial Diamond Mining	
Angola	8.4
Central African Republic	7.4
Guinea-Conakry	3.3
Sierra Leone	13.7
Countries With Primarily Deep Mining	
Botswana	40.1
Namibia	12.0

Diamond trade is being more and more associated with terrorist groups (Sparshott, 2003) like *al-Qaeda*. The illicit conflict diamond trade is estimated to be about 3% (US\$ 237 million) (Sparshott, 2003) to 3-15% (US\$ 237 million-1.2 billion) (GAO, 2002) of a rough-cut-diamond trade that was valued at US\$ 7.9

billion in 2000 (Table 13.4) (Sparshott, 2003). The estimate of the illicit diamond trade is based on historical production capacities for rebel-held areas, mostly in Sub-Saharan Africa, but which some dispute, believing these figures to include smuggled diamonds from non-conflict areas (GAO, 2002).

Table 13.4: Rough diamonds mining 2000

COMPANY	LOCATION MINES	OF	VALUE OF MINED DIAMONDS (US\$ 1,000s)	PERCENT OF WORLD SUPPLY
De Beers	Botswana, South Africa, Tanzania	Namibia,	3,541,720	45
Airosa Ltd.	Russia		1,595,000	20
BHP Billion	Canada		453, 555	6
Rio Tinto	Australia		360,600	5
Other	Africa, China, Latin America		1,906,120	24
Total			7,856,995	100

“The United States enacted the Clean Diamond Trade Act (The Act, Public Law 108-19) on April 25, 2003, which was initiated by Congress in response to the use of diamonds in fueling conflict and human rights violations in parts of Africa. The Act bans the importation of rough diamonds from any non-participant in the Kimberley Process Certification Scheme (KPCS). Presidential Executive Order 13312, effective July 30, 2003, amends prior Orders on the subject to reflect provisions of The Act, bans all rough diamond imports from Liberia, even if they originated elsewhere, and removes the prior ban on all rough diamond imports from Sierra Leone that are controlled through the KPCS” (USITC, 2003).

The new program requires a certificate to accompany each shipment of “rough diamonds”. It does not apply to cut diamonds. Individual countries are responsible for establishing internal controls, such as licensing diamond mines and generating the certificates. While credited by human rights groups as a positive step, the plan relies heavily on voluntary participation, industry self-

⁵⁵¹ U.S. General Accounting Office.

regulation and occasionally inadequate controls along the supply line. “ ‘I applaud the Kimberley Process. My question is how effective will it be...’ ” said Timothy Docking, an African affairs specialist at the U.S. Institute for Peace, a non-partisan institution funded by U.S. Congress (*In: Sparshott, 2003*).

Without an international certification system, conflict diamonds shipped to an intermediary country can be mixed into otherwise legal shipments (Cilliers, 2000 *In: Celliers & Dietrich, 2000; Sparshott, 2003*), said a report by the U.S. General Accounting Office (GAO, 2002) in disagreement with the Bush administration. In the U.S., a bill with tighter controls is being pushed by Senator Richard J. Durbin, a Democrat (Sparshott, 2003).

Another major problem is that, although deep mining is very expensive and only four major companies control diamonds coming from these sources, across Sub-Saharan Africa shallow alluvial diamond fields exploited by artisanal miners makes controlling the trade and movement of rough diamonds (Figure 13.5) extremely difficult (GAO, 2002).⁵⁵² In 2002

“conflict diamonds are associated with four countries—Angola, Democratic Republic of Congo, Liberia, and Sierra Leone. Rough diamond imports from Angola and Sierra Leone not bearing the official government certificate of origin as well as all rough diamonds from Liberia are banned from the United States” (GAO, 2002).

⁵⁵² Alluvial diamond mining is common in Angola, Zimbabwe, the DRC, CAR, Guinea, Liberia, Sierra Leone, Ivory Coast & Ghana in Sub-Saharan Africa (GAO, 2002).

13.10.2.1 Sierra Leone, war and diamonds

Kandeh (2002 *In: Zack-Williams, et al., 2002*) describes the role of the state in Sierra Leone as a form of predatory expropriation or instrumentalisation in which political power and position within the state is converted into private economic wealth. This could be said to be the general status quo throughout the subcontinent in those countries with rich natural resources. In the case of Sierra Leone, this began in 1968, “a kleptocracy” whose main objective was to loot the land. In partnership with European and Lebanese financiers, Siaka Stevens (President from 1968-85) and his coterie engorged themselves on the country’s vast natural resources, while the rest of the nation slid to the bottom of the UN charts rating human misery around the world (Rubin, 1997 *In: Kandeh, 2002 In: Zack-Williams, et al., 2002*). Chua (2003) refers to this as “crony capitalism” in which Stevens created a shadow alliance between himself and five economically powerful, but politically vulnerable Lebanese diamond dealers, resulting in a handful of “outsiders” siphoning off the wealth of the nation at the expense of the country’s development and to the frustration of the impoverished masses who remained poor. For years, a 70% illiterate provincial population had seen its diamond mines generating tremendous wealth for a handful of cronies and corrupt politicians. This is another example of an indigenous leader suppressing democracy, while going into cahoots with a market-dominant minority (e.g., Lebanese in Sierra Leone, Moi with Indians in Kenya, Kaunda and Chiluba with Indians in Zambia), with the potential for chaos to ensue (see Chapter 9, Section 9.6.2.2, ADMADE, Zambia and Section 9.8.5.1, ADMADE).

“The civil war in Sierra Leone began in 1991 gradually subsided in 2001, following the 1999 Lomé peace agreement and the incarceration of Foday Sankoh, the leader of the Revolutionary United Front (RUF). The sale of booty futures helped finance RUF’s initial incursion into Sierra Leone, and twice helped prolong the war by saving the government from defeat. Over its

10-year duration, the war produced between 20,000 and 50,000 deaths and displaced at least 33% (one-third) of the population. Sierra Leone's civil war commenced in March 1991 when a handful of fighters associated with RUF first crossed the border from Liberia. The Liberian leader, Charles Taylor, helped organize and support the invasion; indeed, soldiers from Taylor's army made up part of the RUF incursion" (Ross, 2002).

RUF extorted diamonds from the mining companies, earning as much as US\$ 100 million/year, as well as expropriated wealth from titanium and bauxite mines that produced 57% of Sierra Leone's exports (Madsen, 1999).

Many of the RUF had been trained in Libya, coming from a disenfranchised working class youth hooked on drugs, alcohol and street gambling, with a limited education (Bangura, 1997 *In:* Kandeh, 2002 *In:* Zack-Williams, *et al.*, 2002; Musah, 2000 *In:* Musah & Fayemi, 2000). They were hungry, disaffected and angry. They were easy to recruit, Sankoh promising them (where the state had failed) jobs, free education and a mission (Chua, 2003). Non-delivery of public services by the state had a devastating impact on the youth in the 1980s and 1990s, especially in the area of education. As the school dropout rate increased, criminal behavior and banditry increased, defining the youth's response to this hopelessness. The IMF's conditionality requiring the government to terminate subsidies on basic commodities, deregulate the economy, devalue the currency and reduce government spending contributed to this hopelessness and poverty (Kandeh, 2002 *In:* Zack-Williams, *et al.*, 2002; Chua, 2003). Rice prices rose 180% and oil 300%, resulting in conditions ripe for anarchy (Chua, 2003). Kandeh (2002 *In:* Zack-Williams, *et al.*, 2002) argues that economic mismanagement and the looting of public resources provides windfalls for the political elite, but is disastrous for the masses because it undermines state effectiveness and invites IMF wardship. This in turn contributes to the

“lumpensation”⁵⁵³ of significant elements of society. In turn, he argues that the “sobelisation of the army” (that is the transformation of the army into brigands and armed robbers) can be traced to the “lumpen” background of recruits. For local people, the RUF and the army became indistinguishable, as they both committed similar atrocities.

Links between *Al-Qaeda* and Diamonds (“Conflict Diamonds”) in Sierra Leone and Liberia

A recent study by the European intelligence committee shows strong links between Charles Taylor, RUF diamonds and the movement of money by the fundamentalist Muslim al-Qaeda terrorist network (Farah, 2002; 2006). The al-Qaeda network has cornered the diamond market from both Liberia and Sierra Leone, buying up to US\$ 20 million of diamonds. This is believed to have been initiated as a result of a move by the United States to freeze al-Qaeda assets, after the 1998 attacks on U.S. Embassies in Kenya and Tanzania were linked to this organization. Diamonds are small, easily movable and can be traded for arms and their instruments of terrorism. Taylor has also been linked to the illegal arms trade. Support has also been given in housing al-Qaeda operatives by both Liberia and Burkina Faso (Farah, 2002).

Role of PMCs in Sierra Leone’s Civil War

During the war in Sierra Leone, the government was saved from defeat twice by selling off booty futures. In March 1995, RUF had taken control of the country’s main diamond fields and advanced to within 32 km (20 miles) of the capital (Madsen, 1999; Ross, 2002).

⁵⁵³ Of or related to dispossessed and uprooted individuals cut off from the economic and social class with which they might normally be identified.

The government offered future mining rights to the Kono diamond fields (in rebel hands) to Branch Energy, a South African company, in exchange for the services of a South African mercenary firm, Executive Outcomes (EO) (Madsen, 1999; Ross, 2002). By the end of 1995, Executive Outcomes had captured the Kono diamond fields, turned them over to its affiliate Branch Energy and put RUF on the defensive. The Ohio-based Sierra Rutile and Rex Diamonds, trading on the Toronto Stock Exchange, also used Executive Outcomes to protect their interests. Executive Outcomes used black Angolan and Namibian veterans from the famous South African 32 Battalion that fought in the Angolan war, two of South Africa's most decorated air force pilots and local "Kammah Joes (Kamajors)" who used "gris gris" to protect them from harm, and possibly British SAS (Special Air Service) commandos and U.S. military trainers (Madsen, 1999).

In May 1997, the government of President Ahmad Tejan Kabbah, democratically elected in 1996, was overthrown by a group of junior military officers and was forced into exile (Ross, 2002). This was after Kabbah terminated Executive Outcomes (EO)'s contract under pressure from the IMF and was warned by EO, 'in 90 days you will fall.' The coup leader, Major Johnny Paul Koromah was a graduate of Britain's Sandhurst Military Academy and many of his men were trained by Executive Outcomes (Madsen, 1999).

Musah (2002 *In:* Musah; Fayemi, 2000) argues that the British government wanted to return Tejan Kabbah to power after having been deposed by Major Johnny Paul Koromah and his AFRC junta/RUF⁵⁵⁴ rebel coalition, but at minimum cost and indirect involvement. The London-based PMC Sandline effectively served in Sierra Leone as the British government's forces and intelligence network. They also did not want Nigeria, who made up the majority of the Economic Community of West African States (ECOWAS) Monitoring

⁵⁵⁴ Armed Forces Revolutionary Council (AFRC) junta of Major Johnny Paul Koromah /Revolutionary United Front (RUF) rebels.

Group (ECOMOG) peace keeping forces, to take full credit for returning Kabbah to power, being concerned: 1) For Nigeria's appalling internal human rights record, repression and banditry, 2) With the world slump in oil prices, an attempt by Nigeria to get their hands on Sierra Leone's diamonds and 3) For Nigeria's West African foreign policy of a pattern of concentric circles, the epicenter being Nigeria's national political and economic interests and thus, hegemony over the region. The Nigerian government, by keeping the majority of its 10,000 military personnel occupied outside Nigeria, minimized the chance for an internal military coup.

Over the next three months, Kabbah was approached by a series of businessmen who offered to purchase future diamond concessions; the proceeds, in turn, could finance a counteroffensive that would bring Kabbah back to power. In December 1997, Kabbah sold diamond futures to Saxena (a PMC) and hired the services of Sandline (a PMC). Over the next three months, Sandline and Nigerian forces (who were operating under the authority of the Economic Community of West African States (ECOWAS) launched a military offense that forced the junta from power, returning Kabbah to power in March 1998 (Madsen, 1999; Ross, 2002). In 2002, Kabbah signed an agreement with rebel groups officially ending the decade long civil war that killed tens of thousands, was re-elected to second five-year term, and then stepped down after being defeated in September 2007 by opposition leader Ernest Koroma (Barber, 2007b).

Role of Traditional Hunting Guilds in Sierra Leone's Civil War

Included in this effort were the Kamajors, a traditional hunting society of the Mende ethic group, who were transformed by Kabbah into a private 20,000 member standing army with the replacement of traditional hunting rifles with modern equipment such as AK-47's. The traditional commander of the

Kamajors, Chief Sam Hinga-Norman, was appointed Deputy Defense Minister, while the other traditional hunting societies/militias, such as the Tamaboro and Kapra, belonging to other ethic groups, were disbanded (Musah, 2000 *In: Musah & Fayemi, 2000*). Similarly, many of the northern rebels in the Ivory Coast civil war today are members of Dozo guilds, traditional hunter/soldiers dating back to the Malian Empire (see Chapter 2, Section, 2.1.6, Hunting Guilds as a Means of Controlling Access to Wildlife and Chapter 5, Section, 5.7.4.4, Land reform and civil war in the Ivory Coast and Chapter 9, Section 9.8.9.1, Management of Comé-Leraba Game Reserve, Southern Burkina Faso), while in Guinea-Conakry Dozo are managing buffer zones in the *Parc National du Haut Niger* and providing the *de facto* army for the government in power (Fairhead & Leach, 2003).

Role of Superpowers in Sierra Leone's Civil War

Madsen (1999) provides evidence that covert operations were planned in collaboration with high level members of the British Foreign Office and Intelligence, The U.S. State Department and the Pentagon, the private sector and mercenaries.

Once again, France was also involved behind the scene, assisting the National Patriotic Front of Liberia (NPFL) allied to Charles Taylor and to Sankoh's RUF in anticipation of drawing Liberia and Sierra Leone into the West African franc zone as a means of obtaining unhindered access to diamonds and other minerals. This support was provided directly and indirectly through the proxies of the Ivory Coast and Burkina Faso. France was implicated in Taylor's toppling of pro-U.S. leader Samuel Doe. Eventually, Taylor switched allegiance to the Americans, including President's Jimmy Carter and Bill Clinton, as well as Jesse Jackson, Clinton's special envoy for the Promotion of Democracy in Africa – fitting the

mold of the U.S. supporting rebel leaders who shoot their way into power and then create pseudo democracies in which they are the dictator. Perhaps Jackson's position would have better been called envoy for the "Promotion of Hypocrisy" (Madsen, 1999).

By 2005, it is being claimed that certification of rough diamonds as part of the Kimberly process has stopped the illegal sale of "blood diamonds" used to fuel war in Sierra Leone and the region. The biggest challenge today is to assure that the many diamond diggers are paid a fair wage by middlemen. Diamond digger cooperatives are being formed to educate and negotiate fair prices (Menezes, 2005a).

13.10.2.2 Liberia – timber and diamonds– links to regional civil wars

Liberia, one of Africa's few non-colonial states, became independent in 1847, being ruled by a small, wealthy regime dominated by descendants of African-American settlers, until overthrown in 1980 by master-sergeant Samuel Doe. Doe used a monitoring group, the Economic Community of West African States (ECOWAS) Monitoring Group (ECOMOG), to keep himself in power. Doe was finally killed and by July 1997, rebel leader Charles Taylor was elected as President in "so-called democratic elections" (Madsen, 1999). In 2003, Taylor was finally forced by the international community to flee Liberia, taking refuge in Nigeria.

Role of Logging Companies in Support of Charles Taylor

Taylor's logging revenue was an important means to provide continued support to the RUF in Sierra Leone (ANON, 2001b). By 2002, Global Witness and UN Expert Panels uncovered numerous violations of current UNSC (United Nations

Security Council) sanctions by the Liberian government and timber companies, continued human rights abuses by parastatal logging company militias, and significant inaccuracies in the UN's own research of the Liberian timber industry (Global Witness, 2002):

- The Oriental Timber Company (OTC) and Maryland Wood Processing Industries (MWPI) have continued to oversee the importation and stockpiling of illegal weapons, in contravention of UN sanctions. Global Witness investigations have uncovered at least five suspected logging ships that brought weapons into Liberia, which were unloaded at OTC's Buchanan Port and MWPI's Harper Port.
- As stated in the report, OTC and MWPI, along with Inland Logging Company (ILC) and other logging companies maintain private armed militias that are used as parastatal fighting forces for the government, committing grave human rights abuses.
- The UN Secretary-General and the Office for the Coordination of Humanitarian Affairs (OCHA) released a report in October 2001 detailing the possible humanitarian effects of timber sanctions. One report author admitted anonymously that it contained inaccurate and overstated figures. The report also failed to mention the negative effects of the industry as repeatedly outlined in previous UN Expert Panel reports.

Instability in Liberia threatened stability of other countries in the region. By not upholding sanctioning the timber industry, the UN was basically standing by and

allowing the illicit arms trade to continue, while the humanitarian disaster in Liberia escalated and Sierra Leone's peace was undermined (Global Witness, 2002).

Support of Ivorian Rebels by Charles Taylor

French and Ivorian governments say that they suspect the western rebels in the 2003 Ivory Coast civil war were not only supported by Charles Taylor, but also by the terrorist group headed by Osama bin Laden – al-Qaeda – that has reportedly traded in diamonds in West Africa. Had Taylor turned on the French, his former backers? The Ivory Coast Conflict involved a north/south divide as in Sudan, with ethnic differences, xenophobia, a Muslim north and Christian south and land (see Chapter 5, Section 5.7.4.4, Land reform and civil war in the Ivory Coast). Under President Henri Konan Bedie, the concept of *ivorite* - essentially a belief in true Ivorian blood – became popular. Migrants from Burkina Faso, as well as northern Ivorians who shared ethnic and religious ties with Muslim *Burkinabes*, felt persecuted by the largely Christian south and central Ivorians, (see Chapter 5, Section 5.7.4.4, Land reform and civil war in the Ivory Coast). Thus, support to the northern rebels by Muslim fundamentalists would seem an obvious scenario in order to destabilize one of the most stable countries in Africa, closely linked in the past to France and France's economy, with a large expatriate French population and the largest producer of cocoa in the world. The currently elected President Laurent Gbagbo won his position at the exclusion of Alassane Ouattara, a popular northerner, because a court said that he lost his citizenship by using a diplomatic passport from Burkina Faso in the 1970s (Wax, 2003).

Is this possibly another American-French conflict using proxies? It is certain that the United States is interested in controlling the cocoa market (Madsen, 1999). In November, 2004, President Jacques Chirac of France denounced President

Gbagbo's regime as questionable. In December 2004, Mrs. Sarata Ottro Zirignon-Toure, President Gbagbo's deputy chief of staff, visited Washington, D.C. accusing France's 7,000 troops of colluding with the rebels. On November 4th, Gbagbo's troops undertook a preemptive strike against the rebel and French troops to counter what they believed to be a planned rebel offensive. In return, France destroyed the Ivory Coast's air force. France claims that it is there to enforce the cease fire, protect French citizens and economic interests. The Ivory Coast accuses France of operating outside the control of the United Nations' 6,000 peace keepers and in trying to impose neo-colonial control and in stopping the opening of the country to foreign investment, especially U.S. interests (Morrison, 2004).

Taylor's Departure from Liberia

A chain of events led to the forced departure of former President Charles Taylor on 11 August 2003, to take up an offer of asylum in Nigeria with a peace agreement signed on August 18, 2003 in Accra, Ghana. This agreement provided for the disarmament of an estimated 40,000 fighters and the formation of a broad-based transitional government guiding Liberia to fresh elections in 2005 (Human Rights Watch, 2004a).

"During the year's first half the rebel groups Liberians United for Reconciliation and Democracy (LURD) and Movement for Democracy in Liberia (MODEL)⁵⁵⁵ overran much of the country, and by midyear LURD was camped on the outskirts of Monrovia, indiscriminately shelling the city center. Other factors came into play: evidence of Taylor's business connections to al-Qaeda; U.S. President George W. Bush's visit to Africa in July, 2003; the Sierra Leone Special Court's unsealing of its indictment of Taylor for charges relating to responsibility for the war in that country; and international media attention. In August the Economic

⁵⁵⁵ Both LURD and MODEL were established to overthrow Charles Taylor

Community of West African States (ECOWAS) deployed about 2,000 Nigerian peacekeepers in Monrovia, and the United States positioned 3 ships off the coast, with 2,300 marines in reserve. The ECOWAS peacekeepers brought some control to Monrovia, and on 1 October, 2003 a UN peacekeeping mission took over from ECOWAS, to reach 15,000 peacekeepers in 2004, the UN's largest mission anywhere. A National Transitional Government of Liberia, inaugurated on 14 October, will be in power until the elections in 2005" (World Economic Forum, 2004).

"The rural areas of Liberia continue to be plagued by insecurity, and protection of the civilian population remains an urgent priority. By December 2003, only 5,000 peace keepers from United Nations Mission in Liberia (UNMIL) had been deployed, with promised contributions of troops from Pakistan, Bangladesh, Ethiopia and Ukraine yet to arrive. In this vacuum, all 3 factions (government forces, LURD, and MODEL) continued both to fight among themselves and to harass and attack the civilian population" (Human Rights Watch, 2004a).

As of mid-November 2003, there were armed skirmishes between members of the three warring factions, with all three being involved in human rights abuses of civilians, including forced labor (portering food and looted goods), rape and sexual violence, as well as looting of civilian property, especially food items (Human Rights Watch, 2004a) .

In January 2004, the UN Commission of Human Rights requested that Nigeria hand over former President Charles Taylor to the Special Court for Sierra Leone for war crimes in association with his support of Sierra Leonean rebels and urged the UN Security Council to ensure that the United Nations Mission in Liberia (UNMIL) deploy rapidly country-wide in Liberia to fulfill its mandate to protect civilians. It also recommended that no one be given amnesty for human rights abuses (Human Rights Watch, 2004a). By mid-2005, Nigeria continued to protect Taylor, refusing to hand him over to the special court. By March 2006, Nigeria turned Charles Taylor over to the UN-backed Special Court in Sierra Leone that

has in turn requested that he be tried in the Netherlands. Taylor is charged with “11 counts of war crimes and crimes against humanity, stemming from his role in Sierra Leone’s brutal civil war” (VOA, 2006). It should be clearly understood that there are many “Charles Taylors” in Sub-Saharan Africa.

“His trial was resisted by many African leaders precisely because so much of the continent is still ruled by megalomaniacal ‘Big Men,’ who should be held accountable for the systematic destruction of their own countries...Taylor fell where the others have not because he picked a fight with the international community” (Farah, 2006),

including abduction of 500 UN Peace Keepers from Sierra Leone and al-Qaeda links through the sale of diamonds (Farah, 2006).

By April 2004, the United Nations reported that only half of the combatants participating in the disarmament campaign in Liberia were handing in weapons, renewing fears that rebel leaders had collected guns to be shipped to other West African nations, causing further instability in the region. According to the United Nations, in the first six days only 1,800 former rebels from LURD and MODEL turned in less than 800 weapons (Giardino, 2004).

Liberian Child Soldiers Move on to the Ivory Coast

In early 2005, Humans Rights Watch accused the Ivory Coast government forces of recruiting child soldiers less than 15 years of age, who had fought in Liberia, to join militias supporting President Laurent Gbagbo. With the end of war in Liberia, but never having received the education and support promised (no money or food) when they disarmed, these child soldiers are prepared to sell their services to the highest bidder, in this case the Ivorian government, that is committing a war crime by doing so (Menezes, 2005b).

In run-off elections of November 2005, Ellen Johnson Sirleaf became President and appears to be moving her country in a positive direction. In February 2007, the United States and Germany promised to forgive bilateral debt (Melton, 2007b). In May 2007 the United Nations lifted the ban forbidding Liberia to trade in diamonds (Schwartz, 2007). However, a major problem today is that many of the high level Liberian government officials are diaspora who were either born or raised outside of Liberia, or fled the civil war 15-20 years ago and became American citizens or hold green cards. For the most part their children and assets remain in the USA. Many locals fear that they are only in Liberia to cash in, ready to flee if things don't work out, having more of an allegiance to the United States or themselves than to Liberia and its people. Some believe there is a risk that this diaspora will behave similarly to the Americo-Liberian elite, ex-American slaves and their descendants who colonized Liberia and monopolized political power, restricting the voting rights of the indigenous population at independence in 1847 until 1980 (ANON, 2007). In fact, Liberia's new auditor general, John Morlu The Second, stated that the current government, mainly at the level of the government ministers and agency directors, is three times more corrupt than the Gyude Bryant transitional government (Butty, 2007c) that ran Liberia for two years until the above democratic elections were held.

13.10.3 Congo-Kinshasa DRC, Sub-Saharan Africa's world resource war

"I find it particularly remarkable that the diamond exports from the Democratic Republic of Congo (DRC) were some US\$ 897 million in 1997...Based on my research, this is a western syndicated proxy war, and like Sierra Leone, Angola and Sudan, it is war-as-cover for the rapid and unrestricted extraction of raw materials, and war as a means to totally disenfranchise the local people. Diamonds,

gold, columbium tantalite (COLTAN),⁵⁵⁶ niobium, cobalt, manganese and petroleum, natural gas and timber and possibly uranium -- are a few of the major spoils being pillaged behind the scenes as war ravages DRC and some of these minerals are almost solely found in DRC, especially cobalt, niobium, columbium tantalite..." (Snow, 2001 *In: McKinney, 2001*).

The war in the Democratic Republic of Congo (DRC, formerly Zaire) has drawn in the troops of seven other African countries who have fought alongside perhaps a dozen Congolese armies and militias. It is sometimes called "Africa's First World War". The conflict has been closely linked to the exploitation of the country's vast mineral resources, including diamonds, copper, cobalt, gold and columbite-tantalite (COLTAN) (Ross, 2002) and petroleum. This appears to be about greed and a struggle internally, regionally and internationally to control the flow of the Democratic Republic of Congo's mineral wealth. A question that must be raised is whether it is in the interest of many of these factions to see the war end, as this would mean many groups would give up their access to this wealth.

Illegal mining of COLTAN helped to fund the war in Democratic Republic of Congo, resulting in the death of innocent people and contributing to the decline of wildlife killed for food or income by refugees and soldiers (Eves, Stein, Wilkie & BCTF, 2002). Refined COLTAN produces a highly heat-resistant metal powder called tantalum selling for US\$ 220/kg (US\$ 100/pound) (Essick, 2001) to US\$ 400/kg (UN, 2006) to as high as US\$ 800/kg (Peterson, 2003) used to make, among other things, capacitors that manage the flow of current in electronic devices (Vesperini, 2001; Delawala, 2001; UN, 2006). It can be found in everything from cell phones, DVDs, computers and stereos to VCR's (Essick, 2001; Delawala, 2002; Survivors' Rights International, 2004; UN, 2006). While most of the worldwide tantalum supply - valued at as much as \$6 billion a year -

⁵⁵⁶ Columbite-Tantalite = COLTAN.

comes from legitimate mining operations in Australia, Canada and Brazil (Essick, 2001), the Democratic Republic of Congo contains 80% of the world's reserves of COLTAN (Vesperini, 2001).

It is estimated that since 1998, when the war began, three million lives have been claimed from the war, malnutrition and disease (Duke, 2003; Human Rights Watch, 2003; World Economic Forum, 2004), the highest death toll of civilians since WWII (Human Rights Watch, 2003). The Commission for Africa (2005) estimates that 1,000 people are dying/day. Much of the slaughter is ethnically (World Economic Forum, 2004) and resource driven. A recent study by the International Rescue Committee found that five years after the war in DRC officially ended, the rate at which people are dying remains virtually unchanged at 45,000 a month and a total of 4.5 million since 1998. Only a tiny percentage are dying from violence, most succumbing to disease and likely malnutrition. Children account for 50% of the non-combat related deaths (Maphosa, 2008).

The Democratic Republic of Congo remains a country split into three main zones of control. Most of the northern part of the country is under Liberation Front of the Congo/*Front de Libération du Congo* (FLC) control, with support from the Ugandans. Much of eastern Democratic Republic of Congo is controlled by the Congolese Rally for Democracy/*Rassemblement Congolais pour la Démocratie - National* (RCD-Goma), with the support of the Rwandan army (OXFAM, 2001). The situation in the Democratic Republic of Congo is extremely complicated with many factions, both national and international, vying for the spoils of this rich, but impoverished country. This analysis does in no way purport to enter into any detail regarding these groups.

Additional groups in the eastern Democratic Republic of Congo include (Human Rights Watch, 2005):

- RCD-National: Congolese Rally for Democracy/National (*Rassemblement Congolais pour la Démocratie - National*) (RCD-National) in Isiro and Watsa of northeast, in theory integrated into the Democratic Republic of Congo's transitional government.
- RCD-ML: Congolese Rally for Democracy – Liberation Movement (*Rassemblement Congolais pour la Démocratie – Mouvement de Libération*) (RCD-ML) in Beni in North Kivu, in theory integrated into the Democratic Republic of Congo's transitional government.
- FNI: Lendu Nationalist and Integrationist Front/*Front des Nationalistes et Intégrationnistes* (FNI) linked to Uganda in the Ituri Forest region supported by Uganda.
- UPC: Hema Union of Congolese Patriots/*Union des Patriotes Congolais* (UPC) supported by Rwanda in Ituri Forest region; with two factions - UPC-K and UPC-L.
- FAPC: People's Armed Forces of Congo/*Forces Armées du Peuple Congolais* (FAPC) in Ituri Forest area supported by Uganda.
- PUSIC: Party for Unity and Safeguarding of the Integrity of Congo/*Parti pour l'unité et la sauvegarde de l'intégrité du Congo* (PUSIC) of ethnic Hema in northeastern DRC.
- FRPI: Patriotic Force of Resistance in Ituri/*Force de Résistance Patriotique d'Ituri* (FRPI), made up of ethnic Ngiti (Lendu from the south) who operate in areas south of Bunia.

It was not long before a new war broke out, which was the beginning of drawing in Rwanda and Uganda who are supported both militarily and financially by the United States (Madsen, 1999) (see, 13.8.6 Former Cold War allies vying for power in the Great Lakes Region and discussions below).

After helping Kabila's AFDL/ADFL take control of the Democratic Republic of Congo in 1996, Kabila was pressured to expel Tutsi influences, the combined Rwandan/Ugandan forces that put him in power. He ordered the Tutsi allies out of office and the Rwandan military forces out of the Congo, fanning the flames of ethnic hatred by inciting violence against the Tutsi by once again collaborating with their enemy, the Hutu militia. This was the beginning of drawing in countries from southern Africa, as well as logistical support from Libya and Chad. In turn, Uganda and Rwanda allied themselves with Angola's UNITA (Pech,

2000 *In: Musah & Fayemi, 2000*). Africa's First World War was underway, beginning in 1998.

The western and southern parts of the country remain under the government's control, with military support from Angola, Zimbabwe and Namibia. Since March 2001, fighting along the conventional frontline between these rebel movements and the government/allied forces has more or less ceased (OXFAM, 2001).

13.10.3.1 U.S. government involvement in the DRC

"Minerals are vital to maintaining U.S. military dominance, economic prosperity, and consumer satisfaction. Because the United States does not have a domestic supply of many essential minerals, the U.S. Government identifies sources of strategic minerals, particularly in Third World countries, and then encourages U.S. corporations to invest in and facilitate production of the needed materials. Historically, the DRC (formerly Zaire) has been an important source of strategic minerals for the United States. In the mid-1960s, the U.S. Government installed the dictatorship of Mobutu Sese Seko, which ensured U.S. access to those minerals for more than 30 years (see Chapter 11, Section 11.6.6.1, The Katanga story, an "African Solution" to democracy thwarted by the 'Cold War' and beginning of French/American struggle over a quest for Africa's riches).

The United States claims that it has no interest in the DRC other than a peaceful resolution to the current war. Yet U.S. businessmen and politicians are still going to extreme lengths to gain and preserve sole access to the DRC's mineral resources. The U.S. Government continues to provide millions of dollars in arms and military training to known human rights abusers and undemocratic regimes. Thus, the DRC's mineral wealth is both an impetus for war and an impediment to stopping it" (Montague & Berrigan, 2001).

U.S. trained Kagame's Rwandan Patriotic Front (RPF) joined with members of Yoweri Museveni's Ugandan People's Defense Forces (UPDF) and Laurent

Kabila, a Congolese rebel leader, in toppling Mobutu Sese Seko (Madsen, 1999; Montague & Berrigan, 2001). Mobutu Sese Seko had also been trained by the U.S. at Fort Belvoir, Virginia, in the early 1950s (Madsen, 1999), but with the Cold War over, he had served his purpose and was considered expendable by the United States, especially as he appeared to be aligning himself with the French (see Section 13.8.6.11, French and U.S. arm proxies for the takeover of the DRC).

Madsen (1999) argues that both “soldier princes”, Museveni of Uganda and Kagame of Rwanda, along with Kabila of the Democratic Republic of Congo, were proxies of American post-Cold War policies to access the Democratic Republic of Congo’s valuable natural resources to the exclusion of the French (see Section, 13.10.3 Congo-Kinshasa DRC, Africa’s world resource war) (Madsen, 1999). Both Uganda and Rwanda also wanted to form a regional political economic federation of central African states with geographical reconstruction of borders, stability, increased development and trade.

As an advisor to the then military leader, Kagame said,

“ ‘America can live without the Congo, Rwanda cannot...by itself ours is a non-viable country’ ” (Pech, 2000 *In: Musah & Fayemi, 2000*).

The future of the Democratic Republic of Congo (the Congo, old Zaire and Congo Belge), the richest resource endowed country in Sub-Saharan Africa, is one of the most important issues since the end of Apartheid in South Africa (Pech, 2000 *In: Musah & Fayemi, 2000*) that may very well determine the long-term stability of the continent. So far the net result of their intervention has been more resource looting by all sides and hunger and malnutrition growing on a daily basis, seemingly a war without end.

Attempts by the French in the UN Security Council to send multi-national peace keeping forces to stop the civil war in Zaire and to protect refugees appears to have been blocked by the U.S. (Madsen, 1999), as this would obviously have kept Mobutu Sese Seko in power, who appeared to have turned away from the United States towards France and thus allowed the continuation of French hegemony (see Section 13.8.6 Former Cold War allies vying for power in the Great Lakes Region).

Laurent Kabila, a failed Marxist revolutionary running a small shop (some say also a brothel) (Guest, 2004) in Dar es Salaam, was America's handpicked puppet to replace Mobutu Sese Seko. This was the very same Kabila that the Marxist revolutionary Ché Guevara (2001), in his book, *The African dream. The diaries of the revolutionary war in the Congo*, explains that in 1965, although Kabila had leadership qualities, he was too occupied with drink, women and the good life in Dar es Salaam, spending little time in the then Congo Belge. In Guevara's eyes, Kabila lacked seriousness, ideology and a spirit of sacrifice. Guevara left in disgust after about six months, believing that a communist revolution could never take place under such leadership. However, Kabila was good enough to serve as a "puppet" leader to the United States; at least this is what they thought. Some U.S. Intelligence officials were not keen on Kabila,

" 'Mobutu may be a corrupt bastard but at least he was our corrupt bastard' " (Madsen, 1999).

"Laurent Kabila enjoyed the support of Western military interests. Kabila was in frequent contact with Richard Orth, former deputy of the U.S. Defense Intelligence Agency (DIA) for Africa. The agency, which operates as an arm of the Pentagon supplies military intelligence to war fighters and weapons dealers around the world. During the Clinton administration, Orth was appointed U.S. military attaché to Kigali, the Rwandan capital, shortly before Kabila began his march across the DRC. Additionally, former Pentagon officials acted as military advisers to Kabila in Goma,

producing a dangerous mix of business, politics, and military power” (Montague & Berrigan, 2001).

Madsen (1999) confirms these relationships.

The Alliance of Democratic Forces for the Liberation of Congo/*Alliance des Forces Democratique pour la Liberation du Congo* (AFDL/ADFL)”, a coalition of RPF, Ugandan People’s Defense Forces (UPDF) and Kabila’s forces also sought to dismantle camps controlled by the Hutu militia responsible for the Rwandan genocide. The AFDL coalition included U.S.-trained troops. Although Rwandan troops who participated in the AFDL invasion committed gross human rights abuses that a UN report labeled “crimes against humanity”, the U.S. Government continued to provide military support to the Kagame regime (Madsen, 1999; Montague & Berrigan, 2001). U.S. Special Forces were active in 1996 and 1997 along side Kabila in eastern Zaire and both satellite imagery and aerial photographs of Hutu refugee camps in the forest were provided to the Tutsi alliance, apparently by the United States government. This information was used to locate and massacre refugees in these camps. It is estimated that Kabila’s troops committed genocide of about 250,000 Hutu refugees from Rwanda and thousands more eastern Mai Mai guerrillas and various tribal minorities (Madsen, 1999).

Laurent Kabila was making enemies right and left with many mining companies, taking money from one company, while signing mining rights to the same concession to another (Madsen, 1999). He was not playing the game and, being expendable, was assassinated with many speculations as by whom. His son Joseph, a former automobile mechanic in Dar es Salaam and not a very good one at that (Mantheakis, 2005), more conversant in English and Swahili than French and Lingala, the dominant language in the west of the country, was put into power at age 29 (Leymarie, 2001), making him the youngest President in the world. He

is also said to have been a taxi driver (Reuters, 2005; Blair, 2006a; 2006b; 2006c; Pambazuka News, 2006). Others say that he was his father's "right arm" in business and possibly politics in Dar es Salaam (Kiesel, 2005). He basically grew up in Tanzania, had some military training in Rwanda and apparently began, but never finished university training in Uganda (CIDOB, 2001). When his father took over the Democratic Republic of Congo, he was also sent for military training for three months in China (CIDOB, 2001) and was then appointed general (CIDOB, 2001; Leymarie, 2001) and head of the Democratic Republic of Congo's army. Since becoming President, it appears that he has received a distance learning bachelor's degree in international studies and diplomacy from Washington International University (IRIN, 2006). This university is neither accredited by a U.S. Department of Education agency nor by the U.S. Distance Learning Association (USDLA, 2006), nor currently accredited by the national Council on Higher Education Accreditation while degrees from this university are not recognized by Michigan's Department of Civil Service (Michigan.gov, 2006).

There are differences of opinions as to whether Joseph is the legitimate son of Laurent Kabil (Kiesel, 2005; Southscan, 2005) and even if he is, if his mother is a Democratic Republic of Congo national – some saying she is Rwandan (Leymarie, 2001; Southscan, 2005), which may make it difficult for him to demonstrate both his parents were Congolese citizens, potentially impacting his ability to run for state president, though parliament has yet to set conditions (Earthscan, 2005). So little is clearly known of Joseph Kabil's past, fact and fiction being hard to distinguish. What is obvious is that he is too young and inexperienced to run possibly the mineral richest country on the continent, but then he does not have to if he is a prop, with Western interests calling the shots as usual. One problem appears that neither Laurent Kabil nor his son Joseph have been recognized as the legitimate leaders of the Democratic Republic of Congo in

the eastern part of the country, nor is the eastern Democratic Republic of Congo itself united (Hart & Mwinyihali, 2001).

13.10.3.2 U.S. military aid

During the Cold War, the U.S. government shipped \$400 million in arms and training to Mobutu Sese Seko. The William (Bill) Jefferson Clinton administration transferred its military allegiance to Rwanda and Uganda. In 1998, President Clinton praised Presidents Paul Kagame and Yoweri Museveni as leaders of the “African Renaissance”, just a few months before they invaded the Democratic Republic of Congo with U.S. weapons and training. France, Serbia, North Korea, China and Belgium share responsibility, but the U.S. helped to open networks and supply lines, as well as provided arms (Montague & Berrigan, 2001). Alemayehu (2000) implicates both America and France in proxy wars in the Democratic Republic of Congo. By the time it was all over, despite an embargo, illegal arms were being supplied by America, France and South Africa, some to both sides (Madsen, 1999).

As late as mid-2007, the U.S. military is still heavily involved in the Great Lakes Region. The U.S. has backed a meeting of military leaders from DRC, Burundi, Rwanda and Uganda in Kigali, Rwanda to develop various scenarios against rebel forces in the region that involve unilateral action by the DRC up to combined action with the military from these other countries, as well as diplomatic action by the UN or AU (Rippe, 2007). This and a follow-up meeting in Uganda, along with a statement by the U.S. Assistant Secretary of State for Africa Jendayi Frazer that if talks between the Lord’s Resistance Army (LRA) and Uganda did not end in peace in the near future, Washington would support efforts to wipe out the rebels, brought an outcry by the LRA. The LRA stated that any attempt to go

after it in the eastern DRC would mean a return to full scale war (Wadhams, 2007b).

13.10.3.3 International financial lending institution involvement

In 1999, the Congolese Rally for Democracy/*Rassemblement Congolais pour la Démocratie - National* (RCD-Goma)'s financial arm – known as SONEX – received \$5 million in loans from Citibank New York. The International Monetary Fund (IMF) and World Bank have knowingly contributed to the war effort. The international lending institutions praised both Rwanda and Uganda for increasing their Gross Domestic Product (GDP), knowing that it resulted from the illegal mining of the Democratic of Congo's resources. Although Uganda has made strides in improving access to education and reducing rates of AIDS infections, debt relief by Western donors has also allowed it the space to appropriate more money for its military ventures (Montague & Berrigan, 2001).

13.10.3.4 Corporate wars

“In the DRC, valuable mineral resources provided the incentive for international companies to deal with rebels, with revenues transferred into personal bank accounts that were used to purchase more arms to sustain the war” (Transparency International, 2003).

The Ugandan army withdrew from Congo in 2003, following Rwanda the previous year (Human Rights Watch, 2005).

“Each left behind local proxies, the Lendu Nationalist and Integrationist Front/*Front des Nationalistes et Intégrationnistes* (FNI) linked to Uganda, and the Hema Union of Congolese Patriots/*Union des Patriotes Congolais* (UPC), supported by Rwanda” (Human Rights Watch, 2005).

These groups were more than prepared to help sign agreements with the international private sector for mineral rights (Human Rights Watch, 2005).

In January 2001 the Congolese Rally for Democracy/*Rassemblement Congolais pour la Démocratie - National* (RCD-Goma) issued a statement that said it was selling mining “‘monopolies’” in areas it controlled, while the area controlled by Jean Pierre Bemba in the north has become a separate economy with foreign entrepreneurs developing businesses for a market of seven million people (Hartung & Montague, 2001).

“Despite recent troop withdrawals, illegal mining and trade continue unabated. The real party fueling the conflict is foreign capital investment by corporations, with the tacit support of their own governments. This war of genocidal proportions cannot end until U.S. and other Western corporations and governments are forced to change their priorities. Amnesty International, Human Rights Watch, and other organizations have helped to raise international awareness about the urgency of the situation in the DRC, through campaigns against ‘blood diamonds,’ economic exploitation, and the massive humanitarian crisis the country faces. But the DRC’s future is in the hands of its youth, the next generation, the students and grassroots organizers who are dedicated to establishing peace and stability in their country. It remains to be seen whether the United States will encourage this hopeful spirit of change and democracy, or continue to enable the exploitation and destruction of the most resource-rich country on the African continent” (Montague & Berrigan, 2001).

Similarly, the Commission for Africa (2005) concludes the following regarding the multi-nationals and the role they play in destabilizing the subcontinent:

“Sometimes, unwittingly, they make matters worse by hiring security firms to protect their operations. These private armies can become involved in human rights violations. Their arms can be seized by rebel groups. They can crank up tensions further by hiring staff from one social or ethnic group at the expense of another...But some companies knowingly fuel conflict. They pay

substantial sums to oppressive governments or to warlords. Some firms even assist with arms purchases. Some of these actions, like bribery of a local official, are straightforward crimes. Others, like forcibly moving indigenous people from their lands, are illegal under international law. But many of their actions are not crimes – and at present the various voluntary corporate codes of conduct, such as the OECD Guidelines on Multinational Companies, do not provide clear enough guidance on what companies should do in these situations”.

On October 27, 2003, a coalition of NGOs recommended that the United Nations Security Council insist that member states conduct investigations into their multi-national corporations from Asia, Europe and North America, profiteering from the war in the Democratic Republic of Congo. The Security Council was to examine the final report of the Panel of Experts examining the illegal exploitation of natural resources in the Democratic Republic of Congo, which was established in 2000 and which has demonstrated that a drive to control natural resources was a major motive driving the multi-front war. The coalition accused the Security Council of failing to act on previous reports of the panel showing linkages between various corporations and armed groups carrying out massacres and other atrocities. The NGO coalition recommended that both the Security Council and member states must conduct open and transparent investigations using the Organization for Economic Cooperation and Development (OECD) process or other judicial procedures to clarify the role that companies have played in the conflict in the Congo. The Prosecutor of the International Criminal Court (ICC) said his office may also investigate the way businesses have contributed to the prevalence of war crimes and crimes against humanity in the Democratic Republic of Congo. The current fragile peace process in the Democratic Republic of Congo risks failure unless it addresses the underlying economic motivations that have driven the war (Human Rights Watch, 2003; World Economic Forum, 2004). Since many of these companies are American and the UN seems to operate at the whims of the U.S., it is unclear how effective any of this will be, but it is

the beginning of creating transparency and accountability among the international private sector involved in resource extraction.

The “UN Expert Panel set up to investigate the alleged role of local and multinational companies in the conflict in the Democratic Republic of Congo found that as many as 85 companies were guilty of violating the OECD Guidelines on Multinational Enterprises. However, in the two years since the Panel’s report was released, follow-up action has been initiated against only a small handful of these” (Commission for Africa, 2005).

U.S. Corporations

During the conflict, U.S. corporations treated rebel-controlled Zairian territory as open for business, even while Mobutu Sese Seko remained the internationally recognized leader of Zaire. Once the AFDL took control of Katanga (one of the Democratic Republic of Congo’s richest mineral patches), Western friends and allies began negotiating with Kabila for access to mineral resources (Madsen, 1999; Montague & Berrigan, 2001).

American Mineral Fields (AMF)

The sale of booty futures has played two key roles in the conflict: in the first phase, aiding Kabila’s victory over Mobutu Sese Seko and in the second phase, saving the Kabila government from almost certain defeat. To raise money needed to take Kinshasa, Kabila and the Alliance of Democratic Forces for the Liberation of Congo /*Alliance des Forces democratique pour la liberation du Congo* (AFDL/ADFL), a rebel force, struck a deal with American Mineral Fields (AMF), a small US-based mining firm (see Section 13.10.1.4, Petroleum war, Congo Brazzaville). In exchange for an undisclosed sum of cash (and apparently the use of AMF’s chartered Lear jet), AMF received a diamond-purchasing monopoly and after the war, exploration rights to huge reserves of Congolese cobalt, zinc

and copper (Madsen, 1999; Ross, 2002). Peleman (2000 *In: Musah & Fayemi, 2000*) places this “undisclosed payment” as US\$ 25,000.

Montague and Berrigan (2001) suggest that

“in May 1997, American Mineral Fields (AMF) – whose chair is Mike McMurrough, a personal friend of President Clinton – cut a US\$ 1 billion mining deal with Kabila. AMF performed feasibility studies on reactivating the Kipushi mine, a high-grade zinc and copper deposit and landed exclusive exploration rights to an estimated 1.4 million tons of copper and 270,000 tons of cobalt (about ten times the volume of current world cobalt production)”.

Much of this is confirmed by Madsen (1999) and Hartung and Montague (2001).

Bechtel Corporation

“Also in 1997, Bechtel, the engineering and construction company, established a strong relationship with Kabila. Bechtel – whose history of collaboration with the CIA is well documented in Laton McCartney’s 1989 book, ‘Friends in High Places’ – drew up a master development plan and inventory of the country’s mineral resources free of charge. Bechtel also commissioned and paid for NASA satellite studies of the country for infrared maps of its mineral potential. Bechtel estimates that the DRC’s mineral ores alone are worth \$157 billion” (Montague & Berrigan, 2001).

Hartung and Montague (2001) also discuss these relations. Kabila was still a rebel leader through these deals with the American private sector (Hartung & Montague, 2001).

Chevron

“In January 2000, Chevron – the corporation that named an oil tanker after National Security Advisor (under the George W. Bush administration) Condoleezza Rice – announced a 3-year, \$US 75 million spending program in the DRC, thus challenging the notion that war discourages foreign investment. In 1999, the company, which has been present in the Congo for 40 years, was producing 17,700 bpd. It hopes that, by 2002, production will increase to 21,000 bpd. The gamble seems to be paying off. When Joseph Kabilo, Laurent Kabilo’s son and successor (Kabilo was assassinated), visited the United States earlier in the year, he reassured Chevron officials that stability under his leadership would ensure a safe environment for investment” (Montague & Berrigan, 2001).

Phillips (2004) confirms former Chevron director Rice’s ties to the oil industry and the 129,000 ton Bahamas-registered Chevron oil tanker named after her.

Barrick Gold, Inc. of Canada

“One of the major goals of the Rwandan-backed Congolese Rally for Democracy/*Rassemblement Congolais pour la Démocratie – Mouvement de Libération* (RCD-Goma), a group fighting the Kabilo government in Congo, is restoration of mining concessions for Barrick Gold Inc. of Canada. In fact, the rebel RCD government’s ‘mining minister’ signed a separate mining deal with Barrick in early 1999. Among the members of Barrick’s International Advisory Board are former President Bush (Senior)⁵⁵⁷ and former President Clinton’s close confidant Vernon Jordan.

Currently, Barrick and tens of other mining companies are stoking the flames of the civil war in the Democratic Republic of Congo. Each benefits by the de facto partition of the country into some 4 separate zones of political control. First the mineral exploiters from Rwanda and Uganda concentrated on pillaging gold and diamonds

⁵⁵⁷ The relationship between George Bush Sr. and Barrick Gold, Inc. is also raised in Ruppert (2004).

from the eastern Congo. Now, they have increasingly turned their attention to a valuable black sand called columbite-tantalite or ‘COLTAN.’ COLTAN is a key material in computer chips and, therefore, is as considered a strategic mineral” (Madsen, 2001 *In:* McKinney, 2001).

South Africa Private Sector Jockeying for Control

It appears that Anglo-American of South Africa then “convinced” Kabilia to do an about face and drop its deal with AMF, resulting in a US\$ 3 billion lawsuit against Anglo-American and its affiliates De Beers and Minorco Group – this being dropped in a “backroom” deal in which AMF and Anglo-American went into a joint venture – that went sour as the Tutsi-led anti-Kabilia rebellion broke out in August, 1998 (Madsen, 1999; Peleman, 2000 *In:* Musah & Fayemi, 2000).

Human Rights Watch (2005) accuses South Africa’s AngloGold Ashanti,⁵⁵⁸ one of the largest gold producers in the world, of starting gold exploration activities in the northeastern Democratic Republic of Congo under protection of the rebel group FNI in return for financial and logistical support. The FNI⁵⁵⁹ has created grave human rights violations and is not part of the Democratic Republic of Congo transitional government.

Zimbabwe’s Private Sector Involvement

As part of a deal in what some call the second⁵⁶⁰ Congo war (Human Rights Watch, 2005) to keep Kabilia in power in 1998 from an invading Tutsi army, diamonds, cobalt, copper and germanium were taken from the “Government

⁵⁵⁸ 11 Diagonal Street, Johannesburg, South Africa.

⁵⁵⁹ Lendu Nationalist and Integrationist Front/*Front des Nationalistes et Intégrationnistes* (FNI), Lendu ethnic group serving as proxy army in the Democratic Republic of Congo for Uganda, after Uganda pulled out of Democratic Republic of Congo in 2003.

⁵⁶⁰ The first Congo war was in 1996 in which combined Ugandan, Rwandan and Kabilia forces invaded the Democratic Republic of Congo to oust Mabutu.

Controlled Area” (Burke & Barnett, 2002; *The Observer*, 2002a *In:* Bond & Manyanya, 2003). Sweet deals were cut with Leo Mugabe, President Robert Mugabe’s nephew who was said to have developed business relations with Joseph Kabilá. Both wanted South African mining concerns and likely other competitors out of the deal (Madsen, 1999). A variety of Zimbabwean companies were established to profit from the Congo’s minerals sector, often through joint ventures with state-owned Congolese companies. Some of the Zimbabwe companies were partly owned by the Zimbabwe Defense Force while others were owned by individual Zimbabwean officers. Zimbabwe’s President Robert Mugabe rushed 10,000 troops to the Congo and saved Kabilá’s government (Ross, 2002). US\$ 5 billion in assets were transferred from the state mining sector to private companies under the control of this “elite” network of Congolese and Zimbabwean political, military and commercial interests. There was no compensation or benefit to the state treasury. Zimbabwean-related companies that sold timber through African Hardwood Marketing in London have razed the pristine forests of teak and mahogany in the Katanga province. This company is owned by media mogul, Rupert Murdoch’s former son-in-law, Elkin Pianim and has a joint venture, SAB Congo, with a company called *Société Congolaise d’Exploitation Du Bois* (SOCEBO), partly-owned by senior figures in ZANU and the Zimbabwean military (*The Observer*, 2002b). Diamonds and mining concessions were operated through a Zimbabwe Defense Force (ZDF) company, Operation Sovereign Legitimacy (OSLEG), which in turn operated another company, COSLEG, as a joint venture with a Democratic Republic of Congo firm COMIEX-Congo (Masunda, 2001; WRM, 2002). It was believed in 2003 that most of the Zimbabwean military force had been removed.

13.10.3.5 A regional war

In September 1998, Rwandan troops were on the verge of entering the capital, Kinshasa, and removing the Kabila government. Laurent Kabila was obviously not playing the “game by the rules” as laid down by the West, so he needed to go. In exchange for support, Kabila offered future mineral rights to Zimbabwe, Angola, Namibia, China and North Korea (Madsen, 1999; Ross, 2002). A UN Panel of Experts found that Angola and Namibia were offered mining concessions “ ‘as a sign of gratitude rather than an incentive for their support,’ ” unlike Kabila’s arrangement with Zimbabwe, where the barter was more apparent (Ross, 2002).

Rwanda and Uganda Cash In

Rwanda and Uganda have fought proxy wars there, seeking to control the region’s natural resources and supporting ethnically aligned militias, while the government in Kinshasa also supported assorted militias to gain supremacy over the region (World Economic Forum, 2004).

A 2001 UN report accused Rwanda and Uganda of the “ ‘systematic and systemic’ ” exploitation of Congo’s natural resources. It alleged that, although not directly looting themselves, Presidents Museveni of Uganda and Kagame of Rwanda were on the verge of becoming “ ‘godfathers of the illegal exploitation of natural resources and the continual conflict in the Democratic Republic of Congo,’ ” by allowing their associates, including Museveni’s younger brother, to cash in (Guest, 2004).

Museveni’s wife is said to be a share holder in Busico gold mining company, operating in the rebel-controlled Democratic Republic of Congo. Kagame and his

chief of staff, Kabere, partly own Little Rock Mining, Tenfield Holdings, Colliers Ventures, Sapora Mining and Intermarket (Madsen, 1999).

In 2004, fighting broke out along the Rwandan border, with rebels taking control of Bukavu with support from Rwandan troops (Colombant, 2004b). Even in mid-2004, Corene Crossin of Global Witness states that, “ ‘Much more pressure needs to be placed on Rwanda, Uganda and Burundi to halt illegal exploitation of natural resources’ ” (Agence France-Presse, 2004). By mid-2004, war appeared to be breaking out along the Democratic Republic of Congo/Rwanda border. The ethnic-Tutsi Banyamulenge, with the support of Rwanda’s army, have controlled much of eastern Congo’s resource-rich economy for the past five years and appear very reluctant to give up control of the region under the Pretoria agreement, which basically demands them to hand over control to the Kinshasa government and the new national army (Colombant, 2004b).

By August 2004, the RCD-Goma announced that it was pulling out of the transitional government, in which each rebel group has a vice president, complaining that “corruption remains rampant in Congo, the promised reform of the army had not taken place, and there was a lack of preparation for elections, which are due in ten months”. However, a last minute visit by Thabo Mbeki, the President of South Africa, convinced the RCD-Goma to remain in the government (Lewis, 2004a).

By September 2004, the Democratic Republic of Congo’s soldiers were advancing on the region, fighting against General Laurent Nkunda, a Banyamulenge Tutsi who captured the town of Bukavu (Lewis, 2004b). With a university degree in psychology, General Nkunda was born in Northern Kivu Province and appears to have gone against the lobbying of Thabo Mbeki, pulling out of the transitional government. He fought with the RPF to take Rwanda and

then served as commander for the Rwandan-backed Congolese Rally for Democracy/*Rassemblement Congolais pour la Démocratie* (RCD-Goma), the main rebel group controlling the eastern Democratic Republic of Congo during the five year civil war. Although, General Nkunda claims to be protecting the Banyamulenge, many locals accuse him of using this as an excuse to seek power (Walker, 2004). His group has pulled out of Bukavu, residing about 130 km to the north (Lewis, 2004b) along Lake Kivu, and is known as Congress for the People's Defense.

As late as December 2004, Rwanda's army was being accused by the UN Security Council for making intrusions into the eastern Democratic Republic of Congo after Rwandan Hutu rebels based there since the 1994 Rwandan genocide (Agence France-Presse, 2004). Rwanda has sent its army into the Congo twice before, in 1996 and 1998, now to supposedly attack Rwandan Hutu militias. The last incursion led to a five year war involving seven African countries and three million deaths, mostly from starvation, as described above. A peace agreement 18 months ago was to end this war. The 2004 invasion may have been aimed at Congo's lucrative resources as much as at Hutu militias (*The Washington Post*, 2004). In retaliation, President Joseph Kabilo of the Democratic Republic of Congo sent 10,000 troops to the eastern border region. For four successive days (December 12-15, 2004) fighting took place between Rwandan-backed rebels and Congolese government troops, Kabilo declaring his country "at war" with Rwanda. Meanwhile 1,000 people are dying/day from malnutrition and disease related to the war and its aftermath (Timberg, 2004b). Until power and wealth are shared more equitably, people in these resource-rich Sub-Saharan African countries will remain squatters on their own land (Shiner, 2004b) and victims of resource wealth squandered. Peace in the Democratic Republic of Congo remains fragile.

Other Outsiders Join in the Foray

Other “proxies” who joined in what became known as the “Central African War” and “Africa War I” in support of Kabila were:

- 700 Ugandan rebels from Joseph Kony’s **Lord’s Resistance Army (LRA)** (known to have committed many human rights atrocities north of Murchison Falls);
- **Uganda National Rescue (Resistance) Front (UNRF);**
- **The National Army for the Liberation of Uganda;** and
- **The West Nile Bank Front (WNBF) and Allied Democratic Forces (ADF)** Front - Sudanese backed Ugandan Islamic fundamentalist and virulently anti-Christian group based in the Rwenzori Mountains) (see Chapter 11, Section 11.6.6.2, Uganda, democracy, civil war and attempts to find an African solution).

One of the Ugandan commanders was Taban Amin, son of ex-Ugandan dictator Idi Amin – married to the late Rwandan President Habyarimana’s daughter. Mai Mai warriors, ex-Interahamwe, former Rwandese Armed Forces/*Forces Armées Rwandaises* (RAF/FAR) regulars and members of Burundi’s rebel Hutu Forces For the Defense of Democracy/*Forces de Défense de la Démocratie* (FDD) also joined Kabila’s forces against the Tutsi invaders (Madsen, 1999).

13.10.3.6 UN intervention

It took the international community a long time to intervene. After the UN-brokered Lusaka Accord in 1999, the Security Council established a small UN observatory mission in Congo, United Nations Mission to the Democratic Republic of Congo/*Mission de l’Organisation des Nations Unies en République Démocratique du Congo* (MONUC), on 6 August 1999, with 90 UN observers expected to monitor a fragile cease-fire in a country four times the size of France (World Economic Forum, 2004). UN military observers, as part of the MONUC force, were deployed to positions along the frontline and to other key locations.

The cessation of hostilities between the major armies has given a boost to peace talks and the possible implementation of the Lusaka Peace Accords (OXFAM, 2001).

“Even with added troops in February 2000 and December 2002, MONUC had no authority to use force, and its troops were unable to intervene as civilians were slaughtered before them. Only as the atrocities in Ituri province increased in early 2003, receiving worldwide coverage, did the international community send a robust force of 1,400 EU peacekeepers under French leadership to restore security in Bunia, the Ituri district capital. Although limited in duration and objectives, the ability and willingness of the peacekeepers to use force restored a degree of security to Bunia and its immediate vicinity. Thousands of displaced Congolese citizens returned home, and political authorities were re-established. The Security Council later authorized the deployment of up to 10,800 UN peacekeepers in the Ituri province in July 2003, with a mandate permitting the use of force. The reinvigorated MONUC took over on 1 September, slowly bringing some stability to the region—though massacres continue in areas not yet under MONUC control” (World Economic Forum, 2004).

MONUC’s 10,000 troops have failed to keep both peace or disarm rebels in the vast eastern Congo where central government forces have little presence. In Bukavu and Bunia, the UN troops have stood by while local militias have raped and murdered civilians within sight of its bases (*The Washington Post*, 2004). Even worse, a recently released UN report accuses peacekeepers from Pakistan, Uruguay, Morocco, Tunisia, South Africa and Nepal of rape, pedophilia and sexual abuse of women and girls, which is widespread and ongoing (Lynch, 2004; *The Washington Post*, 2004). In the Ituri Province there are 400,000 displaced malnourished children without access to safe water, latrines, health facilities or adequate food (Schlein, 2005).

In early 2006, it was estimated that 38,000 people died every month from direct or indirect causes of the war raging on in the eastern DRC (Schlein, 2006), while

five years after the official war ended, the toll has risen to 45,000/month (Maphosa, 2008), making this the most deadly conflict since World War II, exceeding the combined deaths from conflicts in Bosnia Herzegovina, Rwanda, Kosovo and Darfur in Sudan (Schlein, 2006). Though, worse than Darfur, Sudan since CNN television is not regularly broadcasting this tragedy, for most of the world the crisis does not exist! Meanwhile, in early February 2006, the Democratic Republic of Congo adopted a new constitution, making one wonder if it applies only to Kinshasa or the entire country. By April 2006, having put their ethnic differences aside, a loose coalition of militia fighters was being organized in the Ituri District, while Congolese government forces meant to neutralize the militias have instead become involved in the illegal gold trade, all of this in the midst of the first elections in 40 years (Lewis, 2006).

An outbreak of fighting in the North Kivu province has displaced over 300,000 people from January to September 2007 (Barber, 2007c; Schlein, 2007b) linked to dissident General Laurent Nkunda who claims to be protecting ethnic-Tutsi from the Congolese government's army known as the *Front de Résistance pour la Défense du Congo* (FRDC) that is collaborating with ethnic Hutu fighters from Rwanda (Barber, 2007c). MONUC's policy of relying on persuasion rather than force to disarm hard-core Hutu militants has achieved nothing (*The Washington Post*, 2004). Plans exist to expand MONUC to 16,000 troops (Timberg, 2004b). The Democratic Republic of Congo is far from reaching peace, prosperity and democracy. An accord was broken only days after a January 23, 2008 ceasefire signed between 25 armed groups that hoped to stem the violence in eastern North and South Kivu Provinces, including Nkunda's National Congress for the Defense of the People (CNDP) and the DRC government. Fighting broke out, a CNDP spokesman claiming that their soldiers were attacked by Pareco Mai Mai and Hutu rebels from Rwanda, the DFLR: Democratic Front for the Liberation of Rwanda/Front démocratique pour la libération de Rwanda (FDLR) (Bavier, 2008). Peace in the eastern DRC appears fragile, and maybe not in the interest of

the various groups hoping to claim access to its vast resources. Some claim that the DRC is so vast and diverse, both geographically and ethnically that it will remain one country with great difficulty.

13.10.3.7 Impacts on biodiversity

Hart and Mwinyihali (2001) explain that biodiversity has been negatively impacted both outside, as well as within the World Heritage Sites of the Garamba National Park (GNP), Virungas National Park (VNP), Kahuzi-Biega National Park (KBNP) and the Okapi Faunal Reserve (OFR).

About 600,000 – one million refugees ended up around the Virungas or Albert National Park, the oldest park in Africa, having been established in 1925 (see Chapter 3, Section 3.4.2.1, Creation of parks and game reserves in Africa). Poaching and deforestation were intensive. Poaching was especially high in camps, with deposed and armed military from the old Rwandan regime. In 1999, in the sector of the Virungas National Park controlled by the RCD-Goma⁵⁶¹ rebel group, 330 buffalo and 450 antelope alone were killed in those areas accessible to park staff, implying the number killed was likely much higher. In 2000, a survey showed that the elephant population was relatively stable, ranging between 485 and 535 elephants, most likely because of their ability to move across the border to Uganda where it was safe (Hart & Mwinyihali, 2001). Vande weghe (2004) estimates that 100 park guards have been killed there since 1996, and by October 2007 an estimated 150 (King, 2007a). Since fighting erupted between forces loyal to General Laurent Nkunda and the Congolese army over a three week period in early September 2007, monitoring by park rangers has been disrupted and 10 IUCN “Critically Endangered” mountain gorillas (*Gorilla gorilla beringei*) have been killed. There are only 700 of these gorillas left in the

⁵⁶¹ Congolese Rally for Democracy – Liberation Movement (Rassemblement Congolais pour la Démocratie – Mouvement de Libération) (RCD)– supported by Kagame’s Rwanda with a base in the town of Goma.

mountainous region where the DRC, Uganda and Rwanda borders meet (King, 2007a).

The Garamba National Park (GNP) was one of the first areas impacted by armed conflict with 80,000 refugees fleeing the civil war in Sudan. Arms and ammunition were abundant and with the Sudan People's Liberation Army (SPLA) adjacent to the park, meat poaching in the northern sector was a problem. Between 1995, before the civil war, and 1998 the elephant population was halved from greater than 11,000 to less than 5,500. The buffalo decreased in the same time frame from greater than 25,000 to less than 8,000. Notable decreases were observed in hippo and hartebeest (Hart & Mwinyihali, 2001).

In 2000, elephant poaching swept through the entire Okapi Faunal Reserve (OFR), with illegal COLTAN mining camps serving as the foci for poaching and deforestation. Congolese and Ugandan military were involved in poaching from the military base of Mambasa. By early 2001, the Ugandan military in collaboration with the OFR, helped bring elephant poaching in the reserve under control (Hart & Mwinyihali, 2001).

Around the Kahuzi-Biega National Park (KBNP), internal displacements have increased population densities around the reserve to 300 persons/km². By mid-2000 there were 35,000 displaced persons around the park. Mining for gold, castorite and COLTAN, along with ivory in the lower-altitude sector of the reserve, was a major problem (Hart & Mwinyihali, 2001). Peterson (2003) noted that as the market price for COLTAN ore shot up to US\$ 800/kg, 10,000-15,000 peasant farmers abandoned their fields for mining, even inside the national park. A ground census in 2000 suggested that the gorilla population had been halved from 254 to 130. The entire population of elephants, about 350, has been decimated (Hart & Mwinyihali, 2001). Vande weghe (2004) estimates that 75%

of the gorillas may have been wiped out by Mai Mai rebels. Peterson (2003) and Redmond (2001) indicate a drastic reduction in both elephant and gorillas (Grauer's subspecies of Eastern Lowland Gorillas, *Gorilla beringei graueri*, once estimated at 17,000 was reduced 80-90%, down to 2,000 – 3,000 in three years). The “KBNP population of Grauer’s gorilla was contiguous with those in the adjacent Kasese forests, and together they represented 86% of the world total for this sub-species” (Redmond, 2001). Chimpanzees, buffalo and large antelope have also been wiped out to feed the miners and now the smaller species are being exploited and will soon be gone (Peterson, 2003). While miners make US\$ 80/day or more – extraordinary by local standards, the majority of the profits go to the “Big Men”, leaders of the guerrilla factions controlling the area and charging taxes, traders in the cities and foreign middlemen linked to Western consumption (Peterson, 2003). Attempts by the UN High Commission for Refugees (UNHCR) to set up a refugee camp in this park (which would have been devastating to both the wildlife and vegetation) were halted thanks to the efforts of the park warden and the United Nations Educational, Scientific and Cultural Organization (UNESCO) (Vande weghe, 2004).

Likewise, next door the anarchy resulting from the Rwanda genocide that is linked to what happened in the Democratic Republic of Congo, resulted in the Akagera National Park (created in 1932 by Belgium), a savanna area in the east, being reduced from 250,000 to 100,000 ha by 1996 (Vande weghe, 2004).

13.11 AFRICA’S POTENTIAL WATER WARS

Water shortages are a growing problem in many parts of the world. To meet the needs of people and the environment, renewable freshwater resources of 1,700 m³/year/per capita are considered adequate. Below that, supplies are short: a figure between 1,700 and 1,000 m³/year means water stress, while less than 1,000

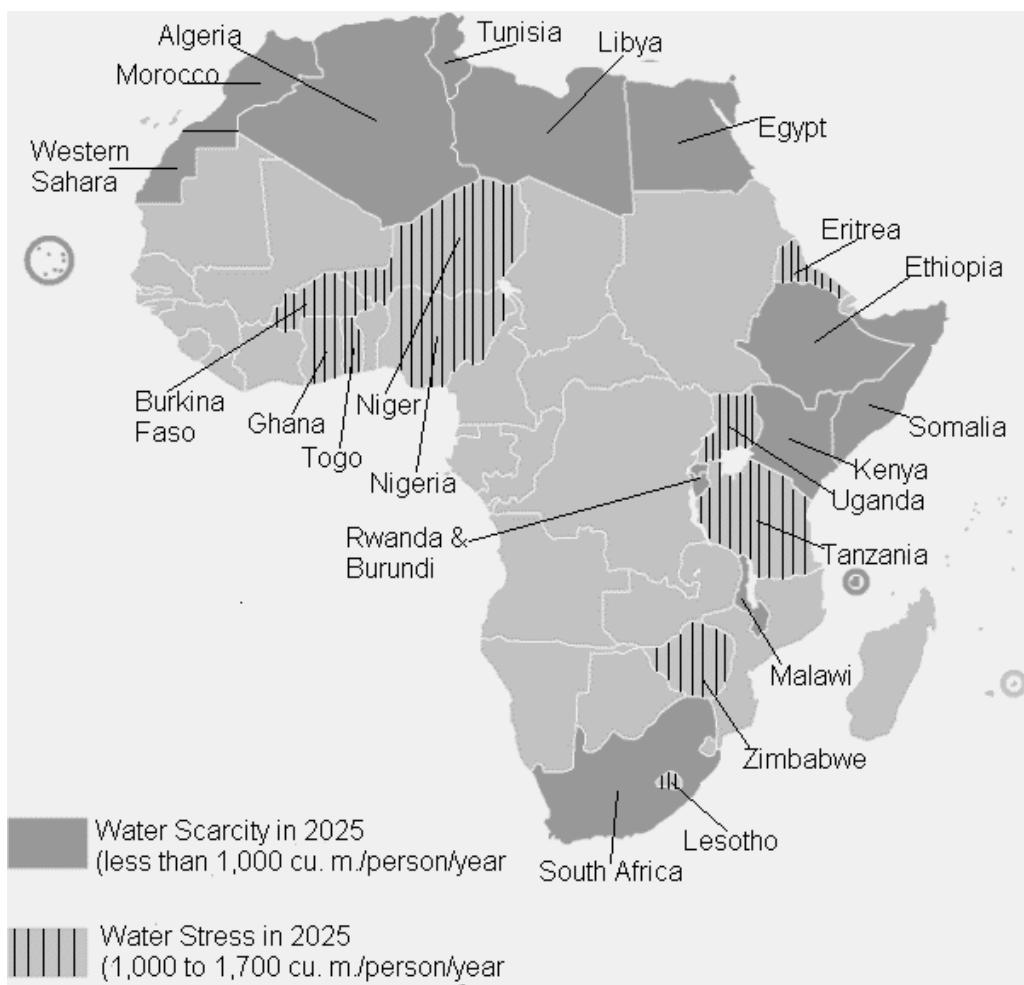

$\text{m}^3/\text{year}/\text{per capita}$ represents water scarcity. The minimum human water requirement is considered $1,000 \text{ m}^3/\text{year}/\text{per capita}$ (Klare, 2001).

Less than 3% of the world's total water supply is fresh water. About 66% (2/3rds) of the fresh water is tied up in glaciers and polar ice caps. Much of the rest is sequestered in the soil and deep underground aquifers. Less than 1% of the world's freshwater water supply or about 0.01% of all water on earth is accessible to the human population. It is estimated that only about 50% (1/2) of the $12,500 \text{ km}^3/\text{year}$ of available fresh water is actually being used. However, while the world population doubled between 1950 and 1990, global water use increased by 300%. Water use and availability is not evenly distributed (Klare, 2001).

Human consumption and sanitation is the most important use of water, though it takes only 10% of the available supply. Globally, irrigation is the largest consumer of water, taking an estimated 70% (Lake & Souare, 2002; Brown, 2002). Irrigation likely takes a smaller share in Africa, where only 7% of cropland is irrigated, compared to 17% worldwide (Lake & Souare, 2002). FAO (1997a *In: Barbier*, 1998) estimates that 6% (11,580,000 hectares) of Africa's current cropland (193 million hectares) is under irrigation (see Chapter 5, Section 5.12.1.3, Irrigation potential). By 2000, it is estimated that Sub-Saharan Africa had about 5.2 million ha in irrigation or 3.7 % of the arable land under cultivation (see Chapter 5, Section 5.12.1.3, Irrigation potential). It takes about 1,000 tons of water to produce every ton of grain (Brown, 2002; 2003).

It is estimated that the African continent has 35% of the world's untapped hydro-potential, 67% (2/3rds) of it in East and Southern Africa. Only 3.4% has been developed (including 63% of North Africa's potential) so there is scope for hydroelectricity to meet growing industrial and urban demand in some parts of Africa (Lake & Souare, 2002).

Globally in 1950, only 12 countries with 20 million people faced water shortages (stress or scarcity) of some sort. By 1990, it was 26 countries (14 in Africa) and 300 million people (Lake & Souare, 2002; Nash & DeSouza, 2002). Nash and DeSouza (2002) estimate that 25 countries in Africa will face water stress or worse by 2025 (Figure 13.6).

Source: UNEP (2000) with permission, UN.

Note: Mauritius and the Cape Verde islands would face water scarcity; Comoros would be water-stressed (islands not shown).

Figure 13.6: Twenty-five African countries will face water stress or scarcity by 2025

Up to 65 countries (32 in Africa) will face shortages by 2050 – after which the world's population is expected to stabilize (Lake & Souare, 2002). While water storage in North America averages 6,150 m³/per capita, in Sub-Saharan Africa, it can range from as low as 43 m³/per capita in Ethiopia to as high as 746 m³/per capita in South Africa – the most developed country on the continent (Deen, 2005).

The main conflicts in Africa during the next 25 years could be over that most precious of commodities – water – as countries fight for access to scarce resources. Potential “‘water wars’” are likely in areas where rivers and lakes are shared by more than one country, according to a United Nations Development Program (UNDP) report (Smith, 1999). The possible flashpoints are (Smith, 1999; Shiner, 2005) the Nile River Basin, the Niger River Basin, the Volta River Basin and the Zambezi River Basin.

Population growth and economic development will lead to nearly one in two people in Africa living in countries facing “water scarcity”, or what is known as “‘water stress’” within 25 years (Smith, 1999). The UN proposes monitoring worldwide reserves of drinking water and establishing agreements for the use of water (Brown, 2001).

13.11.1 Nile Basin Water Conflicts

"One day, every last drop of water which drains into the whole valley of the Nile... shall be equally and amicably divided among the river people, and the Nile itself ... shall perish gloriously and never reach the sea". (Winston Churchill, 1908 *In: Pottinger*, 2003).

“Shared water resources can lead to tensions between countries, as in the Nile Basin and elsewhere” (Commission for Africa, 2005).

The Nile is the longest river in the world, stretching 6,650 km (4,130 miles) from its sources in equatorial Africa to the outlet in the Mediterranean. The Nile collects and disperses water in 9 (10) countries: Burundi, Congo (the Democratic Republic of Congo), Egypt, Kenya, Rwanda, Sudan, Ethiopia (Eritrea), Tanzania and Uganda (FAO, 1997b). The river has two major sources: from Lake Victoria, the White Nile flows through Uganda and into Sudan where it meets the Blue Nile at Khartoum, which rises in the Ethiopian highlands. From the confluence of the White Nile and Blue Nile, the river continues to flow northwards into arid Egypt and on to the Mediterranean Sea. The Nile Basin covers an area of around 3 million km², or nearly 10% of the land mass of the African continent. It is home to 160 million people, of which four of the countries are “water scarce” (Egypt, Sudan⁵⁶², Ethiopia, Eritrea) and has for years been a global hotspot for potential conflict over water resources (Pottinger, 2003). About 85-86% of the Nile’s water comes from Ethiopia and the Blue Nile (Dawoud, 2001; Thomson, 2005a).

The sum of the irrigation potential of all countries in the Nile Basin (Egypt, Ethiopia, Sudan, Uganda, Rwanda and Burundi, Tanzania, Eritrea, Kenya and the Democratic Republic of Congo) leads to a water deficit of over 26 km³/year (without considering possibilities of reusing water as indicated by Egypt and Sudan in their water balance), but only after deducting the water “losses” in the Sudd region (FAO, 1997b) (see Chapter 7, Section 7.10.5.4, Nile River, Aswan High Dam).

As far as large scale irrigation dams are concerned, these dams have a poor record, having fallen short of physical targets, having failed to recover their costs and having been less profitable than expected. Evaporation of huge amounts of water, the salinization and water-logging of agricultural lands, the displacement of

⁵⁶² Note: in Figure 13.6 Sudan is not shown as water scarce.

poor farmers and the landless and an increase in the gap between the “haves” and “have-nots” are all common problems with large irrigation schemes (Pottinger, 2003). It is likely that min-barrages maybe linked to small-scale hydro programs and rainwater catchment programs may reach out to the rural poor better than these *grandiose* plans (see Chapter 5, Section 5.12.1.3, Irrigation potential and Chapter 7, Section 7.10.5.2, Gambia River and Section 7.12, ALTERNATIVES TO LARGE DAMS).

Another problem is energy dependency from hydropower. Already, ten of the Nile Basin Initiative (NBI) member states are dangerously hydro-dependent, including Burundi (98.4% of its electricity comes from hydropower), the Democratic Republic of Congo (99.7%), Ethiopia (94.2%), Kenya (73.9%), Rwanda (97.6%), Sudan (70.6%), Tanzania (86.2%) and Uganda (99.6%).⁵⁶³ Climate change experts believe that dry parts of Africa will see reductions in precipitation. In the Nile Basin, according to the Intergovernmental Panel on Climate Change, there has been a reduction in runoff of 20% between 1972 and 1987 linked to declining precipitation (Pottinger, 2003). This causes concern for the creation of more dependency on hydropower in addition to the fact that the poor of these countries do not benefit from this source of energy. It is likely that hydro-dependent countries will need serious efforts to improve the efficiency and diversification of their energy supply, especially by developing new renewable sources (e.g., solar, wind, geothermal) – not just an interconnected grid as proposed (Pottinger, 2003) (see Chapter 7, Section 7.12, ALTERNATIVES TO LARGE DAMS), such as a southern African grid linked to the US\$ 6 billion Grand Inga hydroelectric project on the Congo River in the Democratic Republic of Congo, expected to generate 40,000 megawatts of electricity, three times as much as any existing hydroelectric dam and more than twice that of China's controversial Three Gorges scheme (Pearce, 2002).

⁵⁶³ Statistics on only eight of the ten countries provided

13.11.1.1 Historical setting of Nile River flow partitioning

Just after WWII, Egypt began speaking of water as a national security problem. The Aswan High Dam was completed in 1970 to give it a guaranteed reserve of 160 billion m³ of water. In 1959, Egypt and Sudan ratified (signed in 1929) the “Agreement for the Full Utilization of the Nile Waters” giving Egypt an annual allocation of 55.5 billion m³ (bcm)/year and 18.5 bcm/year for Sudan; the remaining annual flow of 10 bcm assumed lost through evaporation and seepage from Lake Nasser (Klare, 2001). This gave Egypt the right to 87% of the annual flow of the Nile, with the difference (13%) going to Sudan. It effectively approved Egypt’s construction of the Aswan High Dam that inundated 6,500 km² in Sudan. Ethiopia, where an estimated 85% of the Nile’s annual discharge originates, was not consulted (Pottinger, 2003). Britain signed on behalf of its colonies of Kenya, Uganda, Tanzania, Rwanda, Burundi and Ethiopia/Eritrea in return for the right of Britain to access the Suez Canal (Opala, 2004).

The agreement had one major flaw. It failed to allocate water to states upstream of them. The agreement compels upstream nations to notify Egypt and Sudan of any impending hydro projects along the Nile or its tributaries. Thus, Egypt will only give the green light if it is convinced that its interests are hardly disturbed by the proposed project (Opala, 2004).

After signing a peace treaty with Israel, Anwar Sadat declared that the “‘only matter that could take Egypt to war again was water’ ” (Klare, 2001). Sadat threatened to bomb water facilities in Ethiopia if it implemented a plan to divert some of the Blue Nile’s water to domestic irrigation schemes. Equally threatening comments were made in the 1980s by Egypt’s then minister of state for foreign affairs and later Secretary General of the UN, Boutros Boutros-Ghali, “‘The next

war in our region will be over the waters of the Nile, not politics' ” (Klare, 2001). The problem for Egypt is that most Egyptians (70 million) live in the Nile valley on 4% of the country's land that is dependent on irrigation of which over 95%⁵⁶⁴ of its water comes from the Nile River (Wallis, 2004). Egypt's population has doubled since the 1960s (Thomson, 2005a). Dawoud (2001) estimates that 95% of Egypt's population is packed into the fertile ribbon of land along the banks of the Nile and its delta. No water, no food and no life – this is Egypt's dilemma.

13.11.1.2 Increasing population, increasing demand

Between 2000 and 2050, the Nile Basin is projected to gain 300 million additional people demanding water for irrigation to feed these people (Klare, 2001). Others say the population will double in 25 years (Pottinger, 2003). These states will proceed to build long delayed dams and irrigation schemes. Projected global climate change and reduced flow in the Nile could exacerbate this competition over water as a scarce resource (Klare, 2001). The three principal countries of the Nile River Basin - Egypt, Ethiopia and Sudan - can each increase its take from the river only at the expense of the other two. With the combined population of these countries projected to climb from 167 million today to 264 million in 2025, all three face growing grain deficits as a result of water shortages (Brown, 2002).

Although military conflicts over water are always a possibility, future competition for water seems more likely to take place in world grain markets. This can be seen with Iran and Egypt, both of which now import more wheat than Japan, which was traditionally the world's leading importer. Imports supply 40% or more of the total consumption of grain-wheat, rice and feed grains in both countries. Numerous other water-short countries also import much of their grain. Morocco brings in half of its grain. For Algeria and Saudi Arabia, the figure is over 70%.

⁵⁶⁴ Note above, Dawoud (2001), Pottinger (2003) and Thomson (2005a) place Blue Nile contribution to total flow as 85-86%.

Yemen imports nearly 80% of its grain and Israel more than 90%. Thus, if the world is facing a water shortage, it is also facing a food shortage (Brown, 2001). On the other hand, Lester Brown of the Earth Policy Institute also raises the possibility of a global grain deficit, which could impact the long-term abilities of countries to import grain shortfalls (see Chapter 5, Section 5.3.1.2, Keeping up with future demand – global deficits of the 21st century).

Ultimately, it is believed that the only way to avoid conflict will be to establish a regional development plan like the 1920 “Central Storage Scheme” that would maximize water supplies of all parties concerned. This would entail the construction of additional dams and reservoirs on the upper reaches of the Nile where evaporation rates are lower, while reducing evaporation losses in a lower-level Lake Nasser, saving billions of m³/year of water. Some say the controversial completion of the Jonglei canal in southern Sudan, begun in 1978 and ending in 1984 as a result of civil war, could save billions of bcm's, though cutting through the papyrus swamps of the Sudd (Klare, 2001). However, this has (Rosenblum & Williamson, 1987) and would result in an outcry by conservationists.

13.11.1.3 Nile Basin Initiative (NBI)

Although the Nile Agreement is not legally binding, since it has been practiced for decades it has become customarily-binding. This is supported by experts in international law (Opala, 2004). Established in 1999, the Nile Basin Initiative (NBI) was devised to help reduce tensions and create a framework for equitable sharing and “cooperative development” of Nile water resources (Pottinger, 2003). Currently, Ethiopia uses only 1% of the river's flow, but has begun to update a 1964 plan by the U.S. Bureau of Reclamation, which proposed 33 irrigation and hydropower projects for the Blue Nile. All together, the dams and irrigation works

envisioned under this plan would decrease the flow of the Nile by 4-8 billion m³/year. In addition, it has been reported that Ethiopia is building numerous small irrigation dams, which, when combined, can also seriously reduce the river's flow. Kenya, Uganda and Tanzania have also expressed their desire for a more equitable agreement over use of the Nile's waters and have even asked for compensation from Egypt for its constraints on their development. Most recently, in 2003, Kenya threatened to pull out of the treaty, which Egypt's Minister for Water Resources and Natural Resources called "an act of war" (Pottinger, 2003; Opala, 2004). Ethiopia is angered that Egypt is using its political clout to stop donor investment in planned water projects. It feels that in Egypt water for food, as well as fruits and vegetables destined for Europe are at the expense of development in Ethiopia, a country with erratic rainfall living on food aid, while precious water is lost to Egypt (Thomson, 2005a). In recent times, former UN Secretary General Boutros Boutros-Ghali reiterates his concern that that military confrontation between the countries of the Nile Basin is almost inevitable unless they manage to share water equitably (Thomson, 2005b)

Concern has been raised in a paper prepared by Ugandan academics that,

" 'NBI is no doubt a top-down arrangement that is a partnership between the (East African) governments, donor institutions and the governments of the West...NBI may be said to be a conduit for huge infrastructure developments rather than a new strategy for development in the Nile Basin' " (Pottinger, 2003).

This includes (Pottinger, 2003):

- A 80-100 MW hydropower project at Rusumo Falls on Rwanda's Kagera River, as well as a ranking and feasibility study of all hydropower;

- Integrated Development of the Eastern Nile project (IDEN). Hydropower projects under IDEN include the Baro-Akobo Multipurpose Water Resources Development Sub-Project;
- An Eastern Nile Power Trade Investment Program;
- A hydropower and flood control project in Egypt;
- 45 projects in Ethiopia (including 12 hydropower and eight irrigation projects); including Merowe (estimated to displace 50,000 people) and Tekeze dams;
- Six projects from Sudan (two hydropower projects), including the Kajbar Dam; and
- Uganda's Bujagali and Karuma hydropower dam projects.

The Ugandan government has stated that its portion of the Nile has more than 2,000 megawatts of potential hydropower capacity and has expressed great interest in developing hydropower projects for both domestic use and export. The region's real powerhouse, Ethiopia, has an estimated 45,000 megawatts of "economically feasible" hydropower potential according to industry journals (Pottinger, 2003). The countries of Egypt, Ethiopia and Sudan, through the Eastern Nile Subsidiary Action Program (ENSAP), have agreed to cooperate in the areas of irrigation and drainage, as well as hydropower development and river regulation (Addis Tribune, 2005).

Critics of the NBI argue that the initiative has been a closed affair, involving the member states and the World Bank in decision making, while largely ignoring the voices of ordinary people whose livelihoods depend on use of the Nile Basin's resources (Pottinger, 2003). However, the World Bank in effect enforces the 1929 treaty. The World Bank will not give an upstream country money and a loan to build a dam unless it has an agreement with the downstream country (Wallis, 2004). As a result, the IUCN formed a parallel initiative, the Nile International

Discourse Desk. This is a loose coalition of NGOs and civil society groups with an office in Uganda, hosted by the IUCN to establish national discourses on the NBI. Its goal is to overcome the divisions between: 1) The governmental bodies and multilateral funding agencies behind the NBI and 2) Those citizens in the region who wish to be more fully engaged in decision-making about development in the Basin (Pottinger, 2003).

“The NBI would have a much greater chance of success if it did not repeat the mistakes of the past era of unconstrained dam-building, and if, in the end, it left a healthier Nile River – and Nile River communities – as a legacy”,

especially by going through a bottom-up multi-stakeholder consultative process rather than planning in isolation (Pottinger, 2003). Such programs could take advantage of the Nairobi location of the Dams and Development Project, a UNEP-sponsored group that is the follow-up program to the World Commission on Dams (WCD) (Pottinger, 2003).

Pottinger (2003) is concerned that building large dams will increase friction over the use of the Nile’s waters, along with the social and environmental implications of dams as described in Chapter 7, most of which are rarely mitigated. In early 2006, the Nile Basin is coming into the limelight. The depth of Lake Victoria is at a record low due to record low rainfall (45% of the cause) and the over-release of water by the Nalubaale (Owens falls built in 1954) and Kiira dams (Owens Falls 2 built in 2002) for hydropower (55-60% of the cause) at Jinja where the lake enters into the Nile River (Pearce, 2006; Sunday Vision, 2006). At the end of 2005, Lake Victoria’s water level had dropped 1.2 m since 2003, the lowest level since 1951. Uganda has been releasing more water than the “Agreed Curve”, between Uganda and Egypt that intended to ensure that releases through the dams corresponds to the natural flow of the Nile river before damming (IRN, 2006b). This is having adverse impacts on electricity supplies in Uganda and raises concern over relying

too much on hydropower in the Nile Basin, with the potential for increased conflicts between countries over control of water flows for such purposes.

13.11.2 Lesotho Highlands

In 1998, the Lesotho Highlands Water Project is believed to have helped set off southern Africa's "first water war". In September 1998, in the name of restoring order from public protests against the government, South African troops invaded Lesotho. It is believed that the real reason behind this invasion was to assure protection of the Lesotho Highlands Water Project (see Chapter 7, Section 7.6.1, Lesotho Highlands Water Project (LHWP), the key to providing water to the greater Johannesburg/Pretoria region of Gauteng.

"When the shooting was over, 17 people had been killed near the project's Katse dam and many more had died fighting in the capital, which was left in ruins. South Africa's Star newspaper stated: 'Protection of the dam and its pipeline supplying (the region) with water was a top priority of the occupation forces' " (IRN, 2005).

13.12 CAPITALISM WITH A CONSCIENCE

" 'We are sometimes perceived as arrogant, top-down, non-participative polluters, more interested in providing cheap energy to developed nations than fostering long-term prosperity elsewhere. Because the scale of our operations can dwarf entire national economies, we have been criticized for failing to use that clout as an instrument for positive change,' " (International Association of Oil and Gas Producers, 2002 *In: Gary & Karl, 2003*).

Communism/socialism failed. However, it can be argued that capitalism, as it is practiced today, is failing the developing world just as badly as communism, since pure capitalism is based on maximizing your profits at all costs and has no

morality. We need “Capitalism with a Conscience” in this Global Society. Stiglitz (2002) and Sachs (2005) call it “Globalization with a Human Face”. Guest (2004) refers to such concepts as “Corporate Social Responsibility” to assure that what the private sector is doing addresses environmental and community issues, not just focusing on maximizing profits.

Madsen (1999) argues that up until now “trade not aid” policies with Sub-Saharan Africa have meant inexpensive labor for U.S. manufacturers under a new system of mercantilism competing against cheap labor markets in Asia.

Stiglitz (2002) argues that there are a number of capitalist or market models beyond that of the American model, such as the Japanese, German and Swedish models with comparable per capita income, but with lower inequality, less poverty and unemployment and better health care. These need to be compared against the American model. They are a far cry from the deregulated models preached by the IMF and U.S. Treasury for the rest of the world. Recent scandals with Enron, Arthur Anderson, and Merrill Lynch in America’s banking and corporate system certainly demonstrate the dangers of “unfettered and unregulated markets”, and the need for government regulation to hold the private sector accountable for its actions (Stiglitz, 2002). The recent scandal of Riggs National Bank laundering money for corrupt oil companies and government officials from Equatorial Guinea, as well as possible laundering of money from Saudi Arabia that may have been used to finance terrorism is another case in point (see Section 13.10.1.1, Oil, corruption, multi-national complicity & backwardness in Equatorial Guinea). Each country will have to find its own brand of capitalism that can be used to drive its economy and the above models may help in finding the appropriate way forward.

In the future, those willing to invest in Sub-Saharan Africa must take a long-term perspective towards the continent's natural resources and its people. Investment in Sub-Saharan Africa to take advantage of slave labor and poor or no environmental pollution controls cannot be the impetus for investment. In a presentation to the U.S. House of Representatives, Committee on International Relations and Subcommittee on International Economic Policy and Trade, Scott (1999), of the U.S.-based Economic Policy Institute, raised the need to address these issues that, in turn, were impacting American jobs going overseas. Stiglitz (2002) calls it the development of a "social contract" between citizens and their government and we can add in the private sector (local and international) that assures some fairness in helping assure that the poor share in the gains of society as it grows and that the rich share in the pains of society in times of crisis. "Trickle-down economics" (benefits of growth trickle down to the poor) of the Reagan-Thatcher era has not gotten to the poor in America, let alone the developing world (see Chapter 12, Section 12.1.1 Historical Perspective, Section 12.3, STRUCTURAL ADJUSTMENT, IMF AND THE WORLD BANK, Section 12.3.1, IMF and the World Bank and Section 12.3.4, Structural Adjustment, U.S. Movement to Control Developing Economies). Stiglitz (2002) believes what is needed are "pro-poor" or win-win policies that reduce poverty as they promote economic growth. The private sector has an important role in seeing such policies realized.

The private sector can make a profit, but it must strive towards creating a middleclass and conserving the environment. This was spelled out in recommendations by the African Oil Policy Initiative Group (AOPIG) to the U.S. Congress

"The U.S. should not be partnering with unpopular, undemocratic regimes. On the contrary, proper foreign policy would bolster American values with our allies and encourage democratic

development. One way to achieve this is to engage with energy-producing countries in a way that fosters and encourages the development of a middleclass, rather than allowing petro-dollars to flow into the hands of a small number of corrupt leaders and their associates" (AOPIG, 2002).

AOPIG went on to say, "African oil is not an end, but a means: a means to both greater American energy security and more rapid African economic development" (AOPIG, 2002).

Otherwise the bleak predictions, based on the faceless enemy of terrorism with no clear cut battle front, will jeopardize our quality of life globally, fueled by the anger and frustration of the impoverished masses. While the big stick – a military response to this problem – may seem like the obvious solution (e.g., as in the Niger Delta), as Alan Savory proclaims (see Section 13.3, CAPITALISM WITHOUT A CONSCIENCE), this is dealing with the symptoms, not the causes of the problem; poverty, repression by undemocratic regimes and a feeling of hopelessness for a better quality of life expected by many as they see how the other sides lives on CNN as a result of improved communications associated with globalization.

In the 1960s, America was faced with a threat to its way of life with its policies on segregation. This was primarily contained in the inner cities. The principal author can remember when African Americans in the inner city of the nation's capita Washington, D.C. were screaming "Burn Baby Burn". Going to the Maryland/Washington D.C. line at Westmoreland Circle on Massachusetts Avenue – which led through wealthy suburbs in both Maryland and D.C., past the stately National Cathedral, through "Embassy Row" and eventually into the poor inner city – one could see black smoke bellowing up from behind the Cathedral. The inner city was burning down. The inner city had come to a flashpoint where many did not care whether they lived or died. America realized that this frustration could spill over into the tranquil well-healed suburbs and an entire way

of life could be jeopardized. America realized that repression of people within a country, which purported “Freedom”, while “separate but equal”, could not continue. Though a minority, the African-American community was a significant minority, which white suburbia could no longer suppress nor live at the expense of. America found the way forward in a non-violent way, though major hurdles still exist in overcoming the socio-economic problems of the inner-cities – “caldrons ready to boil over”. The November 2005 riots across France by frustrated lumpen youth of North and Sub-Saharan African decent, jeopardizing everyday life, is another example of reaching such a flashpoint.

It is believed that what happened in Washington D.C. in the mid-1960s has become a global issue, which, until 911, most Americans and the West in general were insulated from. 911 changed this. Though being insular, it is not clear that most Americans, let alone Westerners, realize what is going on beyond their borders and the level of repression, poverty and frustration that most people experience in their daily lives. Many see this outward manifestation of anger and hatred towards the West as purely the actions of a minority fringe group of terrorists that must be dealt with in a Biblical manner, “an eye for an eye and a tooth for a tooth”. Most fail to see that, though the majority of the poor, marginalized and repressed in the rest of the World would never consider such violence, the masses on the other hand also did not completely condemn these actions. One must understand that 911 was an extreme reaction towards the exploitation of the Third World by the First World, but which must be considered as an outward display of the anger and frustration towards the West and the hopeless predicament of the majority of our global society.

Certainly, no one can condone the terrorist expression by a small, but growing group of fanatics that could be in the tens of thousands, but still are a minority of our global society. Chua (2003) describes how an elite ideological minority fan

the embers of the frustrated majority “World Hutu”, to use them as pawns in terrorism (see Section 13.3, CAPITALISM WITHOUT A CONSCIENCE). While a minority using a majority (the world’s poor and disenfranchised masses) drives terrorism, it must be considered symptomatic of a sickness in our global community, which must be overcome.

The sickness, as already discussed, is poverty, repression and hopelessness in much of the developing world by the majority of its citizenry, a form of “Global Apartheid” in which a minority in the West are living lifestyles at the expense of the developing world; something which is not sustainable in the long run. Much of this can be linked to poor and repressive governance, as well as the lack of resource and land tenure that prevent people from controlling their own destinies. The West and the Private Sector can play an important role in helping to overcome this sickness.

If the West wants to use its technologies to exploit the resources of the Third World, then we must demand that wealth generated from this exploitation is reinvested into health, education and infrastructure, and that democratic processes are in place to allow the voice of the people to be heard. We must help create middleclasses on the African subcontinent, based on private sector driven economies linked to the sustainable use of and added value from transformation in Sub-Saharan Africa of its natural resources – not donor driven resources where 70-90% of the money goes back to the donor country (see Chapter 11, Section 11.7.2, Foreign Assistance Conditionalities Good Business for Donor County Not Recipient/Host Country). There must be accountability and transparency demanded by the West from Sub-Saharan Africa’s leaders as to what happens to this wealth.

“The corporation is responsible first and foremost to the law. Some would argue that this is as far as a corporation must go. Milton Friedman argued in the 1960s that within the law ‘there is one and only one social responsibility of business – to increase its profits.’ Today this is more a benchmark reflecting subsequent progress than a commonly shared view. No international business leader would publicly profess these views today. Companies are usually not the villains that detractors may wish to portray. Many corporations recognize the extent of their impact and push to make this positive. The result is a new type of ‘social contract’ that includes society’s expectations and rights regarding corporate operations and the obligations of the corporation toward society. Many American and British multinational corporations now face the situation where 90% of their shareholders are in the U.S. or UK, but most of their turnover, employees, fixed assets, operations are in other countries. Social responsibility does not have to be entirely altruistic, for there are opportunities in doing good that positively affect the first bottom line, such as increased employee pride, better relations with local communities, and a more stable, prosperous future. A results based framework to measure the non-financial bottom line would look for contributions in areas such as social practices, economic, human and community development, as well as environmental sustainability. Human development indicators and tangible improvements in quality of life could be measured to demonstrate results. For example, a firm could possibly point to increased literacy or rising incomes in the areas where it operates as signs of positive impact” (Dietrich, 2000 *In: Cilliers and Dietrich, 2000*).

Clem Sunter is Chairman of the Anglo-American Chairman’s Fund in South Africa, as well as a scenario planner and author of a number of books on looking at future scenarios for Africa, South Africa and the world, including his latest book, *The Mind of A Fox* (Ilbury & Sunter, 2002). He wrote George W. Bush a letter explaining that while globalization has uplifted the world, it has widened the gap between winners and losers, resulting in resentment. It is this relative deprivation – as opposed to absolute deprivation – which causes resentfulness. There is no doubt that the big winner since globalization in the late 1980s is America – you could almost call it “Americanization”. The ease of obtaining nuclear weapons makes conventional weaponry unimportant, changing the rules

of warfare and making the bombing of the World Trade Centre merely an aperitif to what may come if the terrorists are totally ruthless. Nuclear bombs nowadays are so small they can be mailed, shipped or flown into a country (Gibs News, 2003).

There is a general disintegration of world order resulting from the growing gap between winners and losers. All the old religious and ethnic hatreds are coming to the surface again around the world because when you lose, you look for something to inflame the masses with. Isolationism will only create a more divided world than we already live in today (Gibs News, 2003).

America can try to isolate itself so that terrorists and illegal immigrants can not enter, or they can go after the perpetrators that are wanted dead or alive. The alternative is a Friendly Planet, where America takes the lead to overcome the dysfunctional world we live in today. The most important victory over terrorists is trying to put a more human face on globalization, creating a different kind of world that is not win-lose, but win-win (Gibs News, 2003).

Africa and the world can only hope that more of the international private sector and Western governments begin developing the attitude put forth by Anglo-American towards Africa and its people, demanding accountability from Africa's leaders as to what they do with the wealth that the West helps them extract using Western technologies. Hopefully this will be reinvesting the wealth back into the people and infrastructure, such as the 400 or more students sent to South Africa's universities by Botswana, using money accumulated from mostly diamond mining. Then Africa will change for the better.

13.12.1 “Publish What You Pay” an Attempt at Developing Transparency in Distribution of Wealth from Africa’s Natural Resources

“Rich nations should put in place a series of measures to make theft of national assets more difficult and to deter their own companies from paying bribes in the first place. After all as the former Zairian dictator President Mobutu Sese Seko once reputedly said: ‘It takes two to be corrupt – the corrupted and the corrupter’ ” (Commission for Africa, 2005).

“U.S. oil companies should be encouraged, perhaps through tax incentives, to disclose all payments to the oil producing governments. Diplomatic pressure should be brought to bear to encourage other countries to require such reporting of their energy companies as well” (AOPIG, 2002).

The British Department for International Development (DFID) has convened a forum called the Extractive Industries Transparency Initiative (EITI), which is poorly resourced and relies on voluntary reporting by companies and governments. The 2003, declaration of the G-8 summit in Evian suggested a voluntary approach to promoting transparency in the extractive sector. However, a voluntary approach will not work in the majority of countries because political and business elites currently have a vested interest in avoiding transparency (Global Witness, 2004). Although in its early days, in principle, Nigeria, Ghana, the Republic of Congo and São Tomé e Príncipe have signed on to the EITI (Commission for Africa, 2005).

Furthermore, there is a need for the West to become involved in helping to

“track down money looted by corrupt African leaders, now sitting in foreign bank accounts, and send that money back to the states from whom it was stolen...The UN Convention Against Corruption – the first international legal instrument to recognize the need for all states to commit to asset repatriation – has not been

ratified by one single member of the G-8. It can come into force only if it is ratified by 30 states. It is pointless for the developed world to bemoan African corruption when it does not take the specific measures needed to counter it" (Commission for Africa, 2005).

Relying on companies to disclose information voluntarily has so far failed because they fear discrimination by host countries and competitive disadvantage (Gary & Karl, 2003). For instance, when British Petroleum (BP) wanted to disclose payments to the government in Angola, it immediately faced the threat of losing its license to less scrupulous competitors (Global Witness, 2004).

Launched in 2002, "The Publish What You Pay" coalition of more than 190 Northern and Southern NGOs is calling for legislation to require extractive companies to disclose their payments to all governments. This would help citizens in resource-rich-but-poor countries to hold their governments accountable over the management of revenues (Global Witness, 2004). Major human rights and development groups, such as, Catholic Relief Services,

"Human Rights Watch, OXFAM America, Save the Children, Global Witness, the Open Society Institute and others have joined local groups in producing countries in calling for mandatory disclosure of payments. The UNDP and the World Bank's IFC (International Finance Corporation) have endorsed the concept in principle. A group of European investors representing \$650 billion has called on oil and mining companies to be more transparent in their revenue payments" (Gary & Karl, 2003).

"One approach would be for stock market regulators to require oil, gas and mining companies to publish net taxes, fees, royalties and other payments to all national governments as a condition for being listed on international stock exchanges and financial markets" (Gary & Karl, 2003).

Conditions precedents for foreign assistance [see Chapter 11, Section 11.7.1.1, Overseas Development Assistance (ODA) versus Overseas Assistance (OA)] from public and private sources should require a full disclosure of income by the borrowing country, including loans from the World Bank and IMF (Global Witness, 2004). This would level the playing field by requiring all companies to follow the same procedures, creating transparency by invalidating secrecy clauses in contracts that would no longer be valid. Ultimately, since all companies would be required to follow the same reporting procedures, threats by corrupt government officials to cut, not renew or award contracts, would be largely negated (Transparency International, 2003; Global Witness, 2004).

Without transparency, there can be no accountable government and efforts to ensure that resource revenues are well spent will likely fail, with the effect of deepening poverty, instability, conflict and state failure. It is time for companies and governments to come clean on the revenues generated by natural resource exploitation (Global Witness, 2004). It is high time that the private sector and the global community help create transparent conditions to help assure that the wealth they help generate does not end up as capital flight into Swiss bank accounts for a few elites, but goes back into developing Sub-Saharan African countries and their people.

13.12.2 Chad-Cameroon Oil Pipeline a Possible Model

The African Subcommittee (U.S. Congress) held a hearing in 2002 to look at the 1,070 km Chad-Cameroon pipeline project, which at US\$ 3.7 billion is the largest investment in Africa. This compact between energy companies, the World Bank, the two governments and civil society aims to ensure that oil revenues actually benefit local citizens (Royce, 2002). The World Bank lent Chad US\$ 37 million to help build the pipeline from its Doba Basin oil fields (Junger, 2007). As of

2006, Chad is a relatively small producer (Gollust, 2006) at around 170,000 bpd and over the last three years has received around \$400 million in oil revenues (Bavier, 2006). It is estimated that Chad will receive around US\$ 2 billion over the lifetime of the oil fields (Brottem, 2004). This has been facilitated by private enterprises operating in Chad, where in October 2003, Chad's President officially inaugurated the start of oil production along with a prototype for revenue management from the Chad–Cameroon Petroleum Development Project.

“Working with the World Bank, major oil companies and NGOs, Chad’s government has created a framework for putting revenues into an escrow account subject to public disclosure and audit and with specified percentages agreed for debt repayment, future generations and development projects. The process will be monitored by an oversight committee including government officials and civil society organizations” (World Economic Forum, 2004).

To date, results have been mixed, but the real test began in 2004 when oil revenues more than doubled Chad’s national budget overnight (Gary & Karl, 2003). Chad has passed a Petroleum Revenue Management Law

“that provides for clear and transparent rules for allocating oil revenues, as well as for civil society participation in the Oil Revenues Control and Monitoring Board” (Transparency International, 2003).

However, the pipeline project has been

“sharply criticized by environmental groups such as the Washington-based Environmental Defense Fund. There is growing anxiety that President Idriss Déby,⁵⁶⁵ whose arbitrary rule is

⁵⁶⁵ Dictator “Déby took power by overthrowing another notorious dictator, Hissène Habré, who left behind mass graves that rival those of Iraq and Bosnia and systems of torture, including grotesque mutilations of living prisoners, that stand out even among his peers. Habre, who received hundreds of millions of dollars in U.S. military aid during his eight-year rule, sits in

worrying regional allies and foreign investors, is determined to control the revenue from the project, which is expected to generate as much as 250,000 barrels per day" (Transparency International, 2003).

Likewise, in mid-2005, Amnesty International (2005) challenged Chad, Cameroon and the consortium led by ExxonMobil to assure that agreements between governments and the private sector could in no way be interpreted to bypass human rights based on international standards, such as the Universal Declaration of Human Rights and the African Charter on Human and Peoples Rights.

The Catholic Relief Services (Gary & Karl, 2003) believes that other actors besides African governments must play a vital role to assure this wealth is not squandered, including: foreign oil companies, International Finance Institutions (IFIs) like the World Bank and the International Monetary Fund (IMF), Export Credit Agencies, the U.S. and other Northern governments.

"Especially since World War II, multinational energy corporations, their home governments, and International Finance Institutions have powerfully shaped the global environment in which countries with oil must operate. This is true in Africa today" (Gary & Karl, 2003).

Thus, they have an important role, if not moral obligation, in assuring that the wealth they help generate is reinvested wisely in the development of the African continent. By 2006, the World Bank had frozen oil money to Chad, alleging that it had failed to meet its obligations to channel much of this income to poverty alleviation (Associated Press, 2006; Gullust, 2006; Junger, 2007).

luxurious exile in Senegal, under the protection of other Big Men who have refused to exert any pressure to have him tried for his crimes" (Farah, 2006).

“Ten percent of revenues were to be held in a trust fund for future generations. Eighty percent of royalties and 85 percent of dividends were to pay for education, health, rural development and infrastructure and environmental projects. Five percent of royalties were destined for reinvestment in oil-producing areas” (Bavier, 2006).

Sudan, with money from selling oil to China for about US\$ 2 billion/year, was spending 80% of this revenue in buying Chinese weapons, while backing the Chadian rebel group, Front Uni pour le Changement (FUC).⁵⁶⁶ Given World Bank limitations on Chad’s use of oil revenue, Sudan was outspending Chad on military purchases at 50 to 1. By October 2005, Déby declared his abandonment of the World Bank loan agreement (Junger, 2007).

Idriss Déby’s “first purchase with the oil money was weapons worth US\$ 4.5 million for his security apparatus” (Farah, 2006),

as the people of Chad have become poorer moving from eight to last in 2002 to the bottom five today on the UN Human Development Index (HDI) (Bavier, 2006).

“In April, lender countries agreed to an interim deal with Chad that will allow 30 percent of oil revenues to go directly to government coffers” (Bavier, 2006)

making one wonder if the people living under such a dictatorial regime, literally fighting for its survival, ever will really benefit from such wealth. Meanwhile, Déby changed the constitution to run for and was elected to a third term in May 2006, while under attack from opposition/rebel forces.

To date, “Chad has never experienced a non-violent transfer of power” (Bavier, 2006).

⁵⁶⁶ In December 2006, FUC signed a peace agreement with the Chadian government, though other rebel groups fight on.

In 2003, the International Finance Corporation and a group of leading commercial banks launched the “Equator Principles”, where banks require their borrowers to meet social and environmental criteria before approving project finance loans over an agreed level (World Environmental Forum, 2004). Once again, while this sounds good on paper, Chapters 9 and 10 discuss the misuse of modern technologies, such as dams and sewage, many times after extensive environmental and socio-economic studies; the World Bank and USAID being some of the biggest culprits. The agreements above are only as good as the people and organizations that stand behind them. In the current settings, promotion will have to be based on positive social and environmental achievements and not entirely on corporate profits or among donor bureaucracies moving funds at all costs as a means of climbing the ladder.

For the first time according to Shiner (2004a), multi-nationals may be held accountable for their actions:

“In March, a U.S. federal judge ruled that two Chevron Texaco corporations might be held liable for the acts of their Nigerian subsidiary. In 1998, Nigerian military and police hired by the subsidiary allegedly killed a number of unarmed Nigerians protesting Chevron’s environmental and business practices”.

Creating transparent accountability will minimize such actions and hold those accountable who misuse Africa’s wealth to their own ends or against their people as opposed to developing the continent.

13.12.3 Role of Private Sector versus Foreign Aid in Economic Development

“ ‘African countries have been independent for the last 40 years. None of the Black African countries has transitioned from Third World to the First World, like Singapore, for example, has done.

Yet in 1965, Uganda was more advanced than Singapore. One of the reasons for this stagnation was interfering with the private sector by the African regimes in the 1960s and 1970s...Can state agencies reliably produce wealth? The answer to these questions has got two parts: the state cannot produce wealth because bureaucrats have no vested interest in the success of the enterprises; and it is only the private sector, because of their vested interests, that can reliably and sustainably, produce wealth' " (President of Uganda, Yoweri Museveni *In: Geyer, 2005*).

Key policy dialogue has raised the importance of moving away from heavy dependence on foreign aid and the stimulation of economic growth and development through the private sector. At an American Enterprise Institute conference in 1994, a number of key figures spoke out on this issue.

Richard L. Armitage explained, “ ‘...today’s major aid questions, such as the development of national economies or the transition from state control to the market, are not something that developmental specialists at (US)AID – trained in the economic theories of the 1960s and 1970s – are well equipped to handle...Whether administration officials know it or not, they are in a perfect position to redefine foreign assistance⁵⁶⁷ by refocusing on basic human needs and humanitarian emergencies, while placing the American private sector in the leading role in promoting economic development around the world.’ ”

Richard E. Bissell, member, independent inspection panel, World Bank believed that, ‘....One thing foreign assistance should not do is get in the way of the private sector....’

Thomas P. Sheehy, Jay Kingham Fellow in International Regulatory Affairs, Heritage Foundation believed that, ‘...U.S. aid program should be geared toward one major end: encouraging economic growth...economic growth most often comes from assisting the private sector and avoiding the usually corrupting influence of the state...Transitional programs designed to encourage economic growth allow us to step away from one of the big problems of such assistance: continued dependency and the

⁵⁶⁷ (see Chapter 11, Section 11.7.1.1, Overseas Development Assistance [ODA] versus Overseas Assistance [OA])

sense of donor obligation...we need to acknowledge that a great deal of our basic human needs programming has simply failed...sustainable development has been identified as the heart of the foreign aid reform bill. There it is defined as broad-based economic growth that reduces hunger and poverty, protects the environment, enhances human capabilities, upholds democratic values, and improves the quality of life for the current generation while preserving that opportunity for future generations...lineage of sustainable development is quite disturbing. It has been described—accurately, I would say—as a euphemism for environmental socialism...' " (AEI, 1994) or donor handouts.

"Today there is no serious dispute that markets are required for growth, and that aid cannot work in the absence of markets. There is growing agreement that assistance cannot buy market reforms. All that an increasingly beleaguered band of aid defenders now claim is that foreign assistance may be useful if extended to governments which have already adopted good economic policies" (Bandow, 2002).

13.12.4 The “High Road” versus the “Low Road”

Clem Sunter (1992) of Anglo-American identifies “eight” requirements for what he calls the “High Road” in helping the Third World develop:

- Triad (Western Europe, North America and Japan) shares ideas and technologies with the developing world rather than money (e.g., added value stays in Sub-Saharan Africa from adopting Western technologies that transform more of Africa’s raw products in Africa to take pressure off rural landscape and its natural resources through urbanization and industrialization, provide jobs, create an educated middleclass with an environmental conscience and stimulate the economy);
- Foreign aid only for catastrophes (e.g., floods, earthquakes, volcanic eruptions, cyclones, droughts, epidemics, etc.), infrastructure (especially hospitals and schools) and the environment – though the authors would argue that the environment would be better off if rural communities were

aided in sustainably using their natural resources through private sector initiatives they control in partnership with the West (turning them into economic resources for development as opposed to wasting Western taxpayers' money through NGOs who have no entrepreneurial skills and who live off this foreign aid), mostly at the expense of rural people and who tend to tie up the subcontinent's natural resources as opposed to valorizing them;

- Money should come from foreign investors – with poor countries competing for equity capital;
- Loans only to countries following certain globally approved policies of development (e.g., democratic process, rule of law, transparency in the use of income from natural resource extraction and transformation, etc.);
- Equality of Trade – Triad eliminates trade barriers as discussed in Chapter 12, especially for agricultural goods and textiles where Sub-Saharan Africa/developing world is competitive and Triad stops dumping subsidized agricultural products;
- Sound international monetary system;
- Arms trade strictly controlled; and
- Balance economic development against environmental health – polluters pay.

Sunter (1992) goes on to raise concern, which one could argue is becoming a reality in 2005, that if the aging developed world, the “Rich old millions”, live in isolation from the “poor young billions” of the developing world, they risk to be invaded as South Africa, the United States and Europe are by the hopeless masses from the sinking economies of dysfunctional nation states. As discussed over the last three chapters, much of this dysfunction can be attributed to the historical and current relationships between the West (Triad) and Sub-Saharan Africa/developing world.

Sunter (1992) believes that unless the “High Road” is taken, the results could be world-wide economic collapse, anarchy, mafias, death squads and a thriving security industry – which appears to be more the case than not in today’s Sub-Saharan Africa to the point that the U.S. military is establishing military bases and developing military alliances across the continent to protect its interests, especially oil, and to fight what it calls “terrorism”. This is dealing with the symptoms rather than the causes of the problem and thus, will not “cure the disease” using military interventions in a failed attempt to solve socio-economic problems. Genocide in Darfur and Rwanda, ethnic cleansing in Kenya and 45,000 people dieing/month in eastern DRC are indicators of this “socio-economic disease” that must be addressed. Global disorder risks upsetting the movement of base metals, oil and other commodities impacting not only the economies of the developing world, but of the West, as well as their security as epitomized by 911. Handouts of “foreign aid” from the West will not work; rewarding failure and creating a dependency culture (see Chapter 11, Section 11.7, FOREIGN ASSISTANCE IN GENERAL and Section 11.12, TRADE NOT AID). Sunter (1992) suggests that the United Nations has become a Tower of Babel, with the developing world perceiving the use of the Security Council to impose majority rule on the World. The go-it-alone attitude of the USA in Iraq and the veto of the UN Security Council resolution condemning Israel’s assassination of Hamas leaders in early 2004 are not too far from this scenario. Sunter believes that we are at a crossroads.

13.12.5 Poor Track Record in Achieving United Nations “Millennium Declaration” Goals

Ultimately, the West, as much as Africa, will determine whether mankind takes the “High Road” or the “Low Road”. As a global society, we are all in this together and we will all sink or swim together. Which road shall we take? The

2004 report of the Global Governance Initiative (World Economic Forum, 2004) scores the efforts so far as very poor (Table 13.5):

The numerical scores range from a scale of 0 to 10 with a 10 indicating that the world—national governments, businesses, civil society and international organizations taken together—did everything needed during 2003 to be on track to reach the goals. A 5 indicates that the world did half of what it should have done in 2003 about achieving the goal. A 1 reveals little or no meaningful effort. A 0 indicates retrogression: that the activities of the international community during calendar year 2003 actually made the problem worse (World Economic Forum, 2004). If one was to score these issues for Sub-Saharan Africa only, the scores might be 1-2 points lower for each issue.

Table 13.5: How the world scored in achieving United Nations “Millennium Declaration” goals between 2000 and 2003; “10” highest score, “0” lowest score

Here is how the world scored in seven major areas for 2003 on a zero to 10 scale

Peace & Security	3
Poverty	4
Hunger	3
Education	3
Health	4
Environment	3
Human rights	3

Source: World Economic Forum (2004) with permission World Economic Forum.

The Millennium Declaration, signed at the United Nations Millennium Summit by the leaders of 189 nations (World Economic Forum, 2004) set the following Millennium Development Goals:

- **Peace and security:** free all peoples from the scourge of war, both within and between states, seek to eliminate the dangers posed by weapons of

mass destruction, take concerted action against international terrorism and end illicit traffic in small arms;

- **Poverty:** halve the proportion of people living in poverty by 2015;
- **Hunger:** halve the number of people suffering from hunger by 2015;
- **Education:** ensure universal primary education and gender parity in primary and secondary schooling by 2015;
- **Health:** stop and begin to reverse the spread of HIV/AIDS and malaria, reduce the under-five mortality rate by 67% (2/3rds) and the maternal mortality ratio by 75% (3/4s), by 2015;
- **Environment:** stabilize greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system, implement conventions related to the conservation of biodiversity and halve the proportions of people without access to water and sanitation by 2015; and
- **Human rights:** uphold international human rights standards, with particular attention to the prevention of torture and ill-treatment, protection of the rights of migrants, employment and labor rights, the rule of law and access to information.

These goals are not being met throughout Africa, the Andean region and Central Asia (Sachs, 2005). This and previous chapters have clearly spelled out the role of Western countries, their donors, International Finance Institutions (IFIs) and their multi-nationals in creating economic decline, civil unrest and war over much of the subcontinent as a means of accessing cheap raw resources. The failure to share Western technologies with Sub-Saharan Africa in helping them transform their raw resources in Africa, and a failure to hold African leaders accountable for how Sub-Saharan Africa's wealth from these resources is invested as opposed to squandered, should be a major embarrassment to the "do gooders" of the West who have tended to turn a blind eye to such issues in order to maintain their

lifestyles and economies that depend on cheap raw products and energy. As expressed by Sunter (1992), the West's life styles are now in jeopardy due to the failure of the First World to hold Sub-Saharan Africa's/Third World leaders accountable for their actions and thus the backward slide of most Sub-Saharan African/Third World countries since independence with regards to the quality of life, lacking basic economic opportunities, infrastructure and basic social services such as education, health care, clean water and housing. Sachs (2005) feels that overcoming poverty and helping the developing world develop will do more to quell terrorism than addressing the issue mainly as a military one (see Chapter 11, Section 11.7.1.2, ODA).

13.12.6 “Fair-Trade” Versus “Free-Trade”

As discussed in Chapter 5, in Sub-Saharan Africa (SSA) agriculture accounts for 20% (1/5th) of the economy and employs 67% (2/3rds) of the labor force. As discussed in Chapter 12, subsidies, quotas and tariffs are barriers to free-trade used by the United States and Europe to protect their farmers and manufacturers. Ultimately, what some prefer to call “fair-trade” as opposed to one way “free-trade”, along with industrialization, will be necessary to alleviate poverty in Sub-Saharan Africa.

At the World Trade Organization (WTO) ministerial Doha Trade Round meeting in Cancun, Mexico, in September 2003, the most important negotiations dealt with expectations that Europe and the United States would reduce farm subsidies and open their agricultural markets to the developing world. They did not, nor did they by mid-2007. This was a failure of leadership by the powerful economies, revealing the weaknesses of an unfair global governance system (World Economic Forum, 2004). South Africa and Brazil led these negotiations with the West. This meeting was considered a failure and stalemate between the developed and developing worlds with regards to true economic integration. If this failure is

a harbinger of future relations between the West and developing world, humanity is in trouble and civilization as the West knows it today is in danger. The West can not continue to live off the backs of the rest of the World. A possible breakthrough in trade at the WTO Geneva meetings occurred in July 2004, though many NGOs see this as “smoke and mirrors” with little substantial change (see Chapter 12, Section, 12.2.4, Agricultural Tariffs and Subsidies). Time will tell as to what degree the West is really prepared to help in both trade and industrialization in Sub-Saharan Africa.

A recent report by the World Bank has down-played potential benefits to the developing world by 2015 compared to 2002, if all trade barriers (e.g., tariffs, quotas and subsidies – complete trade liberalization) were eliminated (Blustein, 2005):

World Bank projections of benefits to the developing world between 2002 and 2015 if all trade barriers eliminated

	<u>2002</u> <u>Projections</u>	<u>2015</u> <u>Projections</u>
• Increase in Global Income (US\$ billions)	832	287-461
• Developing Countries’ Share of Increased Income (US\$ billions)	539	86-200
• Reduction in Number of People with Income Below US\$ 2/day (billions of people)	320	66-95
• Reduction in Number of People with Income Below US\$ 1/day (billions of people)	110	32-43

Note: Shown as bar graph in original article

These World Bank projections take into account that countries receiving preferential trade could actually be worse off because of increasing competition (see Section 13.13.6.3, Other agreements). In addition, China’s entry into the global market is factored in, as well as a World Bank projection that there will be less people below the poverty line needing uplifting. Additionally, this implies that opening markets in Sub-Saharan Africa to the exportation of raw products, as is currently the case (see Section 13.13, TRADE NOT AID), while providing

some benefits, is not enough. Ultimately, Sub-Saharan Africa must transform its resources on the subcontinent prior to exportation.

If the status quo continues, most recent projections from Mark Malloch-Brown, head of the UN Development Program, are that Africa will not meet the goal of halving poverty until 2147, rather than 2015 (Schlein, 2004), if ever. What does this imply for soil and habitat degradation, Africa's people, the charismatic megafauna, the teeming slums of the urban cities and mass migrations into the industrial world? The West needs to help Sub-Saharan Africa in order to help itself.

13.12.7 Industrialization in Sub-Saharan Africa

Alemayehu (2000) argues that African industrialization is no longer debatable other than the strategies to be used. Without industrialization and resulting economic growth, the continued worsening of economic and social conditions will result in accelerated deforestation, over-grazing, desertification, destruction of biodiversity and uncontrolled and increasing pollution. Food aid and emergency relief ("giving people fish") in perpetuity is not sustainable, but providing Sub-Saharan Africa with appropriate technologies ("teaching them how to fish") (Alemayehu, 2000) is the only hope for the people and natural resources. René Dumont (1966) proclaimed,

"Without factories, an economy cannot get off the ground and effect rapid growth in labor productivity, nor can it provide for the massive demands of modern agriculture. Industrialization is also a symbol for economic progress, not a negligible factor in inspiring enthusiasm for development" (see Chapter 12, Section 12.9.1, Export Transformed Products; It's Not Rocket Science). He goes on to say, "industries during the change over will have to be backed by intensified agriculture if they are to develop. It will supply them with the raw materials of industry" (e.g., cotton, coffee, cacao, maize, fruit, peanuts, palm nuts and livestock), in addition to

petroleum, minerals, timber, fisheries and wildlife – the other key resources of the continent.

Similarly, Alemayehu (2000) argues to start development with the processing and manufacturing of agricultural inputs (e.g., pesticides, fertilizers and farm machinery) and outputs (crops and food processing). Thus to produce the raw products for industry, as discussed in Chapter 5,

“Africa will have to break out...of its infernal cycle of under-production, itinerant crop cultivation, long fallow periods (where possible), lack of fertilizers and reliance on manpower alone. By concentrating solely on industry one cannot solve the problem of rural employment for a good long time” (Dumont, 1966).

“Do Not Give the Needy Money: Build Them Industries Instead ‘When provided the industry, as opposed to the money to build industry (foreign aid and squandered loans), those people will have physical capital. The only profits to be made then are in production; there is no development money to intercept and send to a Swiss bank account’ ” (Smith, 2002 *In: Global Issues*, 2002).

Van der Laan (2002 *In: Zack-Williams, et al.*, 2002) believes that Africa exports too many “non-branded” primarily agricultural products and that it must look to exporting more “branded” manufactured and primary (e.g., sold under a brand name) products from the continent. This was also suggested at an African Trade and Investment Conference held in Gabon in early 1995 (*Washington Times*, 1995c *In: DeGeorges*, 1995), where African countries were encouraged to think in terms of producing goods instead of exporting raw materials to Europe and then importing finished products. It was also suggested that regional markets be developed where, for instance, Gabon or Niger can buy coffee direct from the producer Cameroon instead of importing it from France.

René Dumont (1966) argues that the above will be necessary for “economic decolonization and true independence”.

13.13 TRADE NOT AID

“Wealthy countries should allow trade with poor countries and poor countries should promote trade within and amongst themselves. Trade will lead to production that will lift the standards of living in poor countries. It is prudent therefore that: - Poor countries realize that aid is not ‘help’; it’s detrimental to development. Governments in poor countries (must) pay more attention to human effort and resourceful ingenuity by providing incentives:

- Urgently strengthen the regime of private and commercial property rights (for rural communities) (this could be ownership over land, coastal/shorelines, wildlife, timber and mineral resources) because prosperity and property are intimately linked.
- Enforce rights of contract, explicit and implicit.
- Put in place stable governments, government of laws, rather than the government of men. The rule of law promotes confidence in relations with others hence facilitating mutual exchange of goods.
- Give the poor a chance to choose and prioritize projects that are suitable to their needs by promoting a participatory strategy in project proposals and implementation.
- Focus on sound economic policies by avoiding approaches to aid that sustain central planning system that turns people into virtual serfs, working to fund the failed policies of the state.
- Empower the individuals to achieve economic prosperity.

For the poor countries to be able to empower their people to get food on their tables it is important that they put in place an environment that will make them productive. Such an environment cannot be created with continued bailouts to poor policies by governments that use aid to suppress its people forcing them to subsistence production” (Shikwati, 2002).

However, currently trade with Sub-Saharan Africa is decreasing.

“Total trade between the U.S. and Sub-Saharan Africa dropped considerably in 2002 (the year for which the most recent figures are available), with a decline in both imports and exports. Two-way trade amounted to about \$24 billion, or 15% less than the previous year.

While the 2003 figures are not yet available, it is clear that Africa has been negatively impacted by the worldwide economic downturn, as well as by the war in Iraq, and the continent's economic prospects will remain unstable in 2004" (Booker & Colgan, 2004) [see Chapter 12, Section 12.3.4.4 Trade and structural adjustment policies (SAP)].

"Currently, with the exception of a more diversified relationship with South Africa, U.S. imports from Africa and U.S. investments are both heavily concentrated in the oil sector. In 1996, 71% of U.S. imports from Sub-Saharan Africa were energy-related. That same year, oil producers Nigeria and Angola ranked 26th and 34th worldwide in the value of their total imports to the U.S. (ahead of South Africa at 38th) while oil producers Algeria and Gabon ranked 40th and 44th respectively" (FPIF, 2003).

There are a number of trade initiatives being developed between Africa and the West. An analysis by Meyn (2003), while aimed at the Southern African Customs Union (SACU) comprised of South Africa, Lesotho, Swaziland, Namibia and Botswana, applies to the rest of Sub-Saharan Africa. A general problem, which will be seen below with trade agreements between the U.S. and the European Union (EU) with Sub-Saharan Africa, is that other than industrialized South Africa, SACU/Sub-Saharan Africa export predominantly primary and low-skilled, labor-intensive goods, while importing high-skilled labor, capital-intensive commodities such as transport equipment and electronic products. Intra-industrial trade occurs only between South Africa and the EU and the U.S. respectively and comprises only a limited share of trade (Meyn, 2003). Thus,

"For aid-dependent low-income countries, mostly in Sub-Saharan Africa, their marginalization from financial markets means that they are deprived of any means to mitigate the effects of the significant decline in ODA (Official Development Assistance/foreign aid) they fell into in the early 1980s" (ILO, 2004) (see Chapter 11, Section 11.7, FOREIGN ASSISTANCE IN GENERAL). As a result, many of these countries are still, some two decades later, caught in the debt trap (see Chapter 12, Section 12.5, DEBT AND STRUCTURAL ADJUSTMENT POLICIES).

As will be seen under the Africa Growth and Opportunities Act (AGOA), South Africa is the main beneficiary to date from trade agreements with the West. For this to change, the West may have to go out of its way to bring technologies and training into the rest of the subcontinent as a part of trade agreements to overcome the injustices of the past which maintained Sub-Saharan Africa in a state of under-development (see Chapter 12, Section 12.9, THE WAY FORWARD).

13.13.1 Good Governance and Rule of Law Required for Trade

Meyn (2003) goes on to say that

“it seems doubtful whether the SACU countries will benefit from increased Foreign Direct Investment (FDI) and outsourcing activities of U.S.-firms when entering into an Free-Trade Area/Agreement (FTA) with the USA. As the experience with the EU shows, a contractual agreement with an industrialized country might improve SACU/Sub-Saharan Africa countries’ options to attract FDI but is not a sufficient condition. A prosperous selling market, a big pool of qualified labor, and political stability in the country and the region are judged as more important than an FTA with an industrialized country”.

Countries experiencing political instability are less likely to develop and to receive private investment (CBO, 1997). Similarly, the World Bank (2000) recommends that Africa address four crucial points if it is to “claim” the 21st century and the much needed FDI:

- 1) Improving governance and resolving conflict;
- 2) Investing in people (e.g., health and education);
- 3) Increasing competitiveness and diversifying economies; and
- 4) Reducing aid dependence and strengthening partnerships.

Another problem that Meyn (2003) identifies is that while SACU countries have advantages, such as cheap labor, good infrastructure and macroeconomic stability, countries peripheral to the U.S., especially Mexico and to the EU, namely Eastern Europe, have similar advantages and a closer distance to the delivery area. SACU countries are not able to compete with them, which to some degree is a disincentive to invest in Sub-Saharan Africa.

13.13.2 Transform Products Unique to Sub-Saharan Africa

Sub-Saharan Africa has many products that America and Europe need and/or desire, such as tropical hardwoods, cotton/clothes, coffee, tea, cocoa, many minerals (such as COLTAN), oil and wildlife, all of which Sub-Saharan Africa can begin transforming with Western technologies in Africa. For instance, taxidermy in South Africa is valued at between US\$ 10 million/year (African Advisory Board, 2000) and US\$ 28.6 million/year (NAMC, 2006), while in the Free State of South Africa, raw gold is being converted into jewelry prior to being sent overseas. If this occurred on a continent-wide basis, Sub-Saharan Africa's economies would jump in leaps and bounds. The South African "Promotion of Beneficiation Bill" will provide strong incentives to transform more of the country's minerals in-country in order to obtain added value that provides more jobs and stimulates South Africa's economy (Deliza, 2003). Another movement to help small farmers is "fair-trade Coffee" that assures small farmers an equitable share in the ultimate market value of coffee, US\$ 1 to the farmer when all the middlemen are cut out versus the typical US\$ 0.60 (OXFAM America & TransFair USA, 2004). Farmers are encouraged to grow "organic coffee" with a minimum use of pesticides and fertilizers. This could still go one step further with roasting, processing and packaging of the coffee in the country of origin (see Chapter 12, Section 12.9.1, Export Transformed Products; It's Not Rocket

Science). In fact, the day may come when Sub-Saharan Africa will have to pass laws prohibiting certain raw non-transformed products from leaving its shores.

UNECA (2004) concludes that “Africa needs to diversify out of agricultural and other primary products, and into sectors with a higher value-added”. This is beginning to happen (Table 13.6) (UNECA, 2004).

Table 13.6: Manufacturing as % of export trade for selected African countries, 1980-2001

	1980	1990	2001
Algeria	0.3	2.6	(2.3)
Angola	12.9	0.1	..
Benin	3.4	..	6.2
Cameroon	3.8	8.5	4.7
Comoros	23.8	..	8.2
Côte d'Ivoire	4.7	..	(14.5)
Egypt	10.9	42.5	32.7
Ghana	0.9	..	15.8
Kenya	12.1	29.2	(20.8)
Mauritius	27.4	65.8	74.2
Morocco	23.5	52.3	(64.1)
Nigeria	0.3	..	(0.2)
Senegal	15.1	22.5	28.8
South Africa	18.2	21.9	59.4
Togo	10.6	9.1	49.7

Uganda	0.7	..	6.9
Zambia	16.0	..	12.7
Zimbabwe	35.8	30.9	(28.1)

Note: Figures in italics refer to data for 2000.

Source: UNECA (2004) with permission, UN.

While “trade, not aid” is the general motto for the relations between developing and industrialized countries (not only of the current U.S. government), improved market access will not be enough to integrate the SACU/Sub-Saharan African countries into the world economy. Assistance will be required in the areas of

customs procedures, capacities, finance, human capital, technical standards, etc., and as with the Trade, Development and Co-operation Agreement (TDCA) – with the European Union (EU), the SACU-USA Free-Trade Area/Agreement (FTA) should contain a strong development component. Contrary to the TDCA, the SACU-USA FTA should exclude subsidized agricultural products and open its market comprehensively for agricultural and labor-intensive products where the SACU countries have comparative advantages. Such a strategy would imply less self-interest of the U.S. Government and more commitment to development in SACU/Sub-Saharan Africa (Meyn, 2003).

13.13.3 Role of Government in Trade

Finally, Stiglitz (2002) believes that “free-market ideology” must be replaced with analyses based on economic science with a more balanced view of the roles of both governments and the private sector in driving economies. Even the U.S. Congress (CBO, 1997) in an assessment of foreign aid and development recognized the role of government in protecting fledgling industries until they are competitive in the world market as a means of spurring industrialization and economic growth. However, they concluded that unless the trade subsidies are gradually removed, the industry, due to its monopoly, will become less productive, producing inferior and more costly products for citizens and will become non-competitive in the international market place (see Chapter 12, Section, 12.7.1.6 Beginning of neo-colonialism). The World Bank (1998a) is at least “talking the talk” that,

“evidence suggests that rapid development is possible, and should be based on markets and on effective states playing an economically important facilitating, but not dominant, role”.

In other words, they are concluding that, unlike structural adjustment policies, there is an important role for government (as in the West), as a regulator (environmental and worker rights), monitor and as a facilitator. It is unclear whether the World Bank is “walking the talk” or not.

The long-term key for success of Sub-Saharan African development programs based on foreign investment will not be in the actual international agreements such as the African Growth and Opportunity Act (AGOA) or the New Partnership for Africa’s Development (NEPAD), but in the implementation of these agreements. Implementation must assure appropriate environmental controls in both the work place and the environment, as well as assure appropriate salaries given the cost-of living in a given country so as to create a working middleclass with comparable purchasing power to the North America and Europe, while not being so demanding that the private sector might as well stay at home due to insignificant profit margins (see, Section 13.6 ENVIRONMENTAL STRESS AND POTENTIAL CONFLICTS). In economic terms, these “costs of doing business” must be internalized by the private sector, not externalized. This must be based on negotiation and trust between stakeholders (e.g., the government, workers unions and the private sector). Institutions capable of monitoring and enforcing agreements will be critical to this success. Stiglitz (2002) explains that Singapore, China and Malaysia developed by using Foreign Direct Investment (FDI) to access markets and new technologies, but at the same time kept the abuses of the private sector in check and this is exactly what Sub-Saharan Africa must do. To go along with mirroring the “East Asian Miracle” there will need to be a major investment in education by African governments and state-directed industrial policy (as indicated above) with regard to worker and environmental issues.

Ultimately, FDI must be based on a contract with society that helps to overcome poverty, assures universal education, adequate healthcare, assures appropriate benefits to the worker, deals with the environment and pollution, builds the infrastructure necessary to develop markets, creates accountability and rule of law. In the end, it must help developing countries transform their societies, while retaining the distinct differences relative to their cultures and traditions. Stiglitz (2002) argues that where the interdependent world is going can only work if democratic globalization exists, where decisions are transparent and made multilaterally, as opposed to unilateral, with full participation of all the people of the world.

13.13.4 NAFTA, Maquiladora and the Environment, Lessons for Sub-Saharan Africa

In August of 1992, the governments of the United States, Canada and Mexico concluded negotiations on the North American Free-Trade Agreement (NAFTA). NAFTA came into effect on January 1, 1994. NAFTA was part of a wider package of neo-liberal policies and economic strategies pursued by the Mexican government during the 1980s and 1990s, such as privatization, reduction of government support for agriculture and tighter fiscal policies (Ghisso, 2003) [see Chapter 12, Section 12.3.4.4 Trade and structural adjustment policies (SAP), NAFTA Trade Agreement, a Benefit to Whom – Lessons for Africa].

NAFTA addresses environmental issues in its preamble and in five of its 22 chapters. Former President Clinton criticized NAFTA in the early 1990s for not dealing adequately with environmental issues and committed to negotiate supplemental agreements on both environment and labor (Hufbauer & Orejas, 2001). Although heavily criticized for its inadequacy, the original NAFTA,

negotiated under President Bush (Sr.), included environmental provisions (Auberbach, 1992).

Since its inception in 1965, the Mexico's Border Industrialization Program (*maquiladora* program) has grown to include over 3,000 plants, employing well over 689,420 people (TED, 1997). Most of the program's growth came after 1982 when Mexico's economy suffered severe disequilibria due to the debt crisis, a fall in basic commodity export prices and Balance of Payments (BOP) problems. Concomitant to the increase in the numbers of *maquiladora* plants was rapid population growth, over-development and environmental degradation (TED, 1993). The *maquiladora* program essentially allows foreign-owned and managed companies duty free imports of manufacturing equipment, tools, machinery and spare parts required for production into Mexico. The goods can then be exported to any country in the world with only a value-added tax assessed by the *maquiladora* industries -- which seek to profit by using cheaper Mexican labor in production (TED, 1997).

The NAFTA agreement was supposed to spread the wealth, pushing companies located in the *maquiladora* trade zone further into the country. This has not happened. Instead, more and more companies, primarily American, are relocating to take advantage of the cheaper labor costs – where workers are paid an average of US\$ 0.75 an hour. While the goals of setting up the *maquiladora* zones were admirable, they have brought about the same results as the *bracero* program (allowing Mexican citizens into the United States legally as seasonal farm workers); the exploitation of cheap labor (TED, 1997). “Automobiles, machinery, electronics, apparel, and furniture, previously manufactured in the United States but now made in Mexico by U.S. companies employing \$US 1.50/hour labor” flowed back into the U.S., resulting in the trade deficit with Mexico increasing from US\$ 1.7 billion in 1993 to US\$ 23 billion in 2001 and US\$ 31 billion in

2002. Net U.S. export gains came in agribusiness and bulk commodities like cereals and organic chemicals (Phillips, 2004), raising the question of possible adverse impacts on Mexican farmers having to compete with subsidized American farmers. As the result of NAFTA, “the U.S. trade surplus in agricultural products has declined sharply with Mexico, and has turned into a deficit with Canada...some U.S. producers of corn and cattle have profited, as have all the major grain trading companies, while Canadian Dairy farms, U.S. farmers growing wheat, barley, fruits and vegetables, and Mexican corn producers have all suffered catastrophic losses” (Scott, 1999). Job losses for U.S. industries centered in high wage sectors, mostly in the north (Phillips, 2004).

In 1988, the government of Mexico promulgated the General Law for Ecological Equilibrium and Environmental Protection, a comprehensive framework for environmental protection and natural resource preservation. Based on the U.S. Environmental Protection Act of 1970, the law addresses air, water and soil pollution, hazardous wastes contamination, use of pesticides and toxic substances, ecosystem conservation and consumption of natural resources (TED, 1993). Since 1994, the Secretariat of the Environment, Natural Resources and Fisheries (SEMARNAP) was created which brought the agencies responsible for implementing the county's sustainable development strategy under one roof (USMCOC, 1998):

- The National Ecology Institute (INE) is responsible for developing and reviewing environmental policies and regulations and environmental impact statements, including those involving hazardous waste.
- The National Water Commission (CNA) develops water quality standards, regulates and charges for discharges to water bodies under federal jurisdiction (all rivers, coastal waters and most lakes)

- The Office of the Attorney General for Environmental Protection (PROFEPA) is Mexico's primary enforcement agency and runs Mexico's environmental audit program.

“More than 3,000 *maquiladora* operations are currently in operation along the 3,220 km (2,000 mile) border that stretches from California to Texas -- and their numbers continue to grow. These duty-free industrial plants now focus on using cheap domestic labor to assemble mostly foreign components in a number of different industries. Concentrated development along the border as well as the nature of the industrial development has polluted much of the water supply along the border and created serious environmental issues that have yet to be addressed...” (TED, 1997).

“Mexico faces severe environmental degradation. Years of rapid population growth and industrialization, without adequate environmental investment and enforcement left a legacy of polluted waters and large quantities of improperly stored waste. Only in the last decade has Mexico had environmental laws which were adequate and only since 1993 have these laws been supported by appropriate implementing regulations, standards and institutional infrastructure to make them effective” (USMCOC, 1998).

Many environmental groups and U.S. Congressional members feared that NAFTA would precipitate a mass exodus of U.S. industry to the border region, adversely affecting the region's ecosystem with potential for Mexico's weaker environmental and enforcement standards to undermine tougher U.S. environmental standards. To some, this would represent a hidden subsidy for *maquiladoras*, since they would not have the expense required by U.S. laws governing environmental pollution (TED, 1993; USMCOC, 1998).

“Since NAFTA has been in place, Mexico has begun a serious effort to enforce its environmental laws for new companies, thereby diminishing any incentive for firms to relocate to Mexico to avoid environmental enforcement. In addition, the Mexican

government has begun a process to enforce more effectively its environmental laws by imposing sanctions against the more visible polluters and, more importantly, has developed a program of voluntary environmental audits. These audits permit companies to assess their environmental compliance and develop a program to clean up their operations" (USMCOC, 1998).

"In 1996, PROFEPA conducted 3,323 inspections and compliance verification visits in the border area, ordering 18 total facility closures, 59 partial closures, and fining 2,622 facilities. From 1992 through 1996 PROFEPA conducted 12,347 inspections and compliance verification visits in the border area, including at least one visit to every facility. PROFEPA reports a 72% reduction in serious violation in the maquiladora industry from 1993 to 1996. The percentage of maquiladora facilities in complete compliance, that is, without even minor violations, has climbed 43% during this period. On the U.S. side of the border in 1995 and 1996, EPA, the Department of Justice (DOJ) and state agencies brought over 100 civil, judicial and administrative enforcement actions for border area violations of the U.S. hazardous waste law, the Clean Air Act, the Clean Water Act, Toxic Chemicals law and Pesticides law" (USMCOC, 1998).

In an attempt to deal with environmental concerns, the environmental side agreement, the North American Agreement on Environmental Cooperation (NAAEC), created the Commission for Environmental Cooperation (CEC), the Border Environmental Cooperation Commission (BECC) and the North American Development Bank (NADB), the latter two under the US-Mexico Border Environmental Cooperation Agreement (BECA) (Hufbauer & Orejas, 2001).

Despite this institutional thicket, NAFTA's environmental record is mixed. The CEC has received 28 submissions concerning possible violations of environmental practices (nine versus Canada; 11 versus Mexico and eight versus the United States). The CEC provides an institutional framework for environmental cooperation and sponsors initiatives that reduce pollution (Hufbauer & Orejas, 2001).

The environmental impact of Mexican trade liberalization does not appear to have been positive. Various studies show that post-NAFTA, water, air and soil pollution has increased in Northern Mexico due to the growth of manufacturing industry and the controversial *maquiladora* sector along the border with the United States (Ghiso, 2003).

13.13.5 Foreign Direct Investment (FDI) in Sub-Saharan Africa

Currently, private financial flows in the form of FDI

“have remained highly concentrated in emerging markets. Thus the vast majority of developing countries, including almost all the LDCs, receive hardly any private financial flows” (ILO, 2004).

This implies that Sub-Saharan African leaders must allow the wealth of their country to flow through many hands and not just a few so that a vibrant consumer economy develops. They must place an emphasis on health and education to have productive citizens who can fit into the globalization of their economies and there must be rule of law and basic “democratic” processes in place that fit into their socio-cultural framework. As a result of these factors plus poor infrastructure and corruption, among others, the

“cost of doing business in Africa is 20-40% above that for other developing regions. Improving the investment climate and enhancing the incentives for African and other entrepreneurs to invest and engage in business are central to growth” (World Bank, 2005).

Currently, South Africa may be one of the few countries on the subcontinent meeting the prerequisites for FDI.

FDI and imports from Sub-Saharan Africa, other than industrialized South Africa, tend to be in the oil sector going to very few countries.

“Of the US\$ 2.52 billion in FDI that flowed into Sub-Saharan Africa during the last decade, just three countries accounted for much of that total — Angola, \$US 626 million, Lesotho, \$US 170 million, and Nigeria, \$US 876 million. If South Africa is excluded (as both a recipient and source of FDI), 5 other countries accounted for another US\$ 576 million — Republic of Congo, Cote D'Ivoire, Equatorial Guinea, Namibia, and Sudan — leaving the remaining 40 countries of Sub-Saharan Africa to compete for just \$US 275 million in annual FDI flows” (Luna, Cox & Slengesol, 2001).

Thus, other than in South Africa and Lesotho (textiles), most FDI is going into countries rich in petroleum and minerals (Table 13.7).

About 69% of total Foreign Direct Investment (FDI) flows to Africa in 2001 were accounted for by Sub-Saharan Africa. FDI to Sub-Saharan Africa surpassed the mark of \$10 billion for first time ever to reach \$11.8 billion in 2001 (UNCTAD, 2002a), but was revised to US\$ 13.295 billion (UNCTAD, 2003), largely the result of an Anglo American-De Beers deal, without which Sub-Saharan Africa would show little change. This is reflected in a return to previous FDI levels in 2002 of \$US 7.452 billion (UNCTAD, 2003) (Table 13.7). The increase in FDI flows in 2001 to South Africa is almost identical to the increase in FDI to the sub-region as a whole (UNCTAD, 2002a). UNCTAD places Sudan under North Africa, though many consider it part of Sub-Saharan Africa. Sudan has been added to Table 13.7, but has not been counted in the above figures.

Table 13.7: Foreign Direct Investment (FDI) in Sub-Saharan Africa, 1990-2002 (Millions of Dollars)

Source:	Extracted from UNCTAD (2003).						
Note:	Least developed countries (LDCs) include: Angola, Benin, Burkina Faso, Burundi, Cape Verde, Central African Republic, Chad, Comoros, Democratic Republic of Congo, Djibouti, Equatorial Guinea, Eritrea, Ethiopia, Gambia, Guinea, Guinea-Bissau, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritania, Mozambique, Niger, Rwanda, Sao Tome and Principe, Senegal, Sierra Leone, Somalia, Sudan, Togo, Uganda, the United Republic of Tanzania and Zambia. Oil-exporting countries include: Cameroon, Angola, Congo, Gabon and Nigeria.						
Note:	Table 11.4 indicates 2002 FDI was US\$ 7,963 including Sudan						

Gross Domestic Product (GDP),⁵⁶⁸ appears to reflect to a large degree foreign investment in the economies of Sub-Saharan Africa. It should be noted that of the Sub-Saharan African GDPs, South Africa, with the highest FDI, has the highest GDP of US\$ 104.2 billion. Nigeria, with the second largest FDI, has the next largest GDP of US\$ 43.5 billion. Sudan, with the third largest FDI, has the next highest GDP of US\$ 13.5 billion, followed by the Ivory Coast with a GDP of US\$ 11.7 billion and Angola with a GDP of US\$ 11.2 billion. This leaves a considerable gap between these five countries and the rest of Sub-Saharan Africa with a total GDP of US\$ 119.4 billion to distribute among the remaining 41⁵⁶⁹ Sub-Saharan African countries. This compares to the total GDP of \$US 26,298.9 billion (US\$ 26.3 trillion) for the OECD countries (UNDP, 2004).

⁵⁶⁸ See Footnote 48, Chapter 5, Section 5.2, ECONOMICS OF AGRICULTURE IN AFRICA.

⁵⁶⁹By UNDP count, which differs slightly from UNCTAD's estimate of 47 and the author's of 48 (see Table 13.7).

Morrissey (2003) found that private inflows into Sub-Saharan Africa peaked in the late 1970s at very low levels of just over 1% of GDP for FDI and just over 2% of GDP for Other Private Capital (OPC)⁵⁷⁰, but steadily declined. Total private capital inflows declined by more than 80% between the peak of the late 1970s and trough of the early 1990s. By the late 1990s, FDI began to increase, possibly reflecting increased privatization, while OPC remained stagnant with net outflow in the early 1990s. Official Development Finance (ODF)⁵⁷¹ – that is all foreign assistance, both multilateral and bilateral – was the most important inflow to Sub-Saharan African countries, averaging 12% of GDP over the entire period, with a steady increase from about 6% of GDP in 1970–75 to 14% in 1991–95. Thus, foreign assistance remains the most important investment in Sub-Saharan Africa, keeping these countries in perpetual welfare relations with the West (see Chapter 11, Section. 11.6.7, Foreign aid and puppet governments – “Donor Democracy”).

In 2001, the United States was in the top position among sources for FDI in Africa. Flows from the U.S. to Sub-Saharan Africa recovered from a long period of relatively low levels (US\$ 986 million for the period 1986–1990 and only US\$ 106 million in 1991–1996) to almost US\$ 5 billion in accumulated flows during 1996–2000. TNCs from the United States bought back South African affiliates sold off during Apartheid. FDI flows from almost all EU countries – including France, Germany, the Netherlands, Portugal, Spain, Sweden and the United Kingdom – to Sub-Saharan Africa increased from US\$ 1 billion per annum in 1991–1995 to US\$ 2 billion per annum in 1996–2000 (UNCTAD, 2002a).

⁵⁷⁰ Other Private Capital (OPC): commercial bank lending, bonds, other private credit, non-debt flows and portfolio equity investments (excludes FDI) (Morrissey 2003).

⁵⁷¹ Official Development Finance (ODF) = “Used in measuring the inflow of resources to recipient countries: includes (a) bilateral ODA, (b) grants and concessional and non concessional development lending by multilateral financial institutions (World Bank, IMF, African Development Bank/*Banque Africaine de Développement* (ADB/BAD), and (c) Other Official Flows (OOF) for development purposes (including refinancing Loans) which have too low a Grant Element (q.v.) to qualify as ODA” (DAC, 2005).

United States imports from Sub-Saharan Africa declined by more than 16% in 2002, reducing the interest of Transnational Corporations (TNCs) or multi-nationals in the subcontinent. In spite of the downturn, 24 countries out of Sub-Saharan Africa's 47 (30 of 53 for all of Africa), plus Sudan (listed under North Africa) attracted higher inflows in 2002 than in 2001, largely through greenfield FDI (new foreign investments). This was mainly in petroleum (Algeria, Angola, Chad, Equatorial Guinea and Sudan) and to a lesser extent in apparel (Botswana, Kenya, Lesotho and Mauritius) (UNCTAD, 2003). As will be seen below, any FDI gains made in the apparel sector by 2005 would have been reversed due to China having taken over this market.

While sustained export growth tends to involve a move up the technology ladder – from simple to complex products - Sub-Saharan Africa has lost market share, even in the slow-growing primary and resource-based exports in which it is specialized (UNCTAD, 2002a). Sachs (2005) found that the single most important reason for economic growth and the spread of prosperity was the transfer of technology, China being given as the prime example of a country that used FDI to import needed technologies; the key to it becoming an economic powerhouse. Sub-Saharan Africa needs to follow suit. Sachs (2005) also found that countries with the highest per capita GNP were the countries with the highest FDI.

Former U.S. Congressman, Jack Kemp, who is currently Co-Director of Empower America, suggests a 21st century Marshall Plan for Africa. He also supports the idea of allowing all products from Africa to enter the United States duty and quota-free. He supports allowing U.S. businesses investing in Africa to repatriate their profits tax-free for a five or ten year period as a means of kick-starting capital investment in Africa, quoting Uganda's President Yoweri Museveni, “

‘Ultimately, we don’t need aid. We need trade’ ” (Kemp, 2003). Museveni’s message to the Wall Street Journal, reiterated this theme (Museveni, 2003a; 2003b).

However, the Marshall Plan was tied to purchase of U.S. agricultural products, one of the reasons why the U.S. share in world trade in grains increased from less than 10% before WWII to more than 50% (half) by 1950 (Chomsky, 1999). In the July 2003 visit by George W. Bush to South Africa, the ANC government explained that although they welcomed closer trade ties with the U.S., subsidized agricultural products from America being dumped into South Africa – with obvious negative impacts on local farm production - would not be acceptable.

13.13.6 International Trade Agreements with Sub-Saharan Africa

“Africa benefits from a range of preference schemes – the GSP (Generalized System of Preferences); the EU Cotonou Agreement for African Caribbean and Pacific (ACP) countries; the US African Growth and Opportunity Act (AGOA), and various LDC schemes of the EU, Canada, and Japan. There are 33 LDCs in Sub-Saharan Africa, and 15 non-LDC African countries (Botswana, Cameroon, Cape Verde Côte d’Ivoire, Republic of Congo, Gabon, Ghana, Kenya, Mauritius, Namibia, Nigeria, Seychelles, South Africa, Swaziland, and Zimbabwe)” (Commission for Africa, 2005).

13.13.6.1 Generalized System of Preferences (GSP)

As a result of

“Resolution 21(ii) taken at the UNCTAD II conference in New Delhi in 1968, ‘the objectives of the generalized, non-reciprocal, non-discriminatory system of preferences in favor of the developing countries, including special measures in favor of the least advanced among the developing countries, should be:

- to increase their export earnings;
- to promote their industrialization; and
- to accelerate their rates of economic growth.

There are currently 16 national GSP schemes notified to the UNCTAD secretariat. The following countries grant GSP schemes: Australia, Belarus, Bulgaria, Canada, the Czech Republic, the European Community, Hungary, Japan, New Zealand, Norway, Poland, the Russian Federation, the Slovak Republic, Switzerland, Turkey and the United States of America” (UNCTAD, 2005).

The U.S. African Growth and Opportunity Act (AGOA) and the EU Everything but Arms (EBA) are specific programs linked to GSP.

13.13.6.2 AGOA

The major components of the African Growth and Opportunity Act (AGOA) (Public Law 106-200) are (Office of the United States Trade Representative, 2002; U.S. State Department, 2001):

- Creates a comprehensive trade and investment strategy for those countries in Sub-Saharan Africa who are committed to economic development;
- Helps countries make the transition to economic independence and self-sufficiency without jeopardizing humanitarian interests;
- Negotiates a U.S.-Africa Free-trade Area by 2020;
- Creates the U.S.-Africa Economic Cooperation Forum to bring together ministerial leaders from the U.S. and Africa to discuss bilateral and multilateral cooperation; and
- Creates the U.S.-Africa Trade and Investment Partnership, which would provide \$7 billion in private sector financing over five years, support micro, small and moderate-sized businesses and establish a \$32 billion textile and apparel initiative.

The Africa bill represents the first major trade promotion measure enacted in the U.S. since the North American Free-trade Agreement in 1994, a law that established duty-free commerce between Canada, the U.S. and Mexico. The African Growth and Opportunity Act (AGOA) or Africa Trade Bill provides beneficiary countries in Sub-Saharan Africa with the most liberal access to the U.S. market without a Free-trade Agreement (Export-Import Bank of The United States, 2001).

In particular, AGOA gives beneficiary Sub-Saharan African countries (Export-Import Bank of The United States, 2001):

- “Duty-free treatment under Generalized System of Preferences (GSP) for any article which the U.S. Trade Representative (USTR) and the U.S. International Trade Commission (USITC) determine is not import sensitive when imported from African countries.
- Duty-free treatment for more than 1,800 products. In addition to the standard GSP, 4,600 products available to other non-AGOA GSP beneficiary countries (some examples include agricultural products, building materials, chemicals, machine parts, yarns and fabrics).
- AGOA extends GSP for eligible Sub-Saharan African beneficiaries until September 2008, seven years longer than in the rest of the world”.

“The United States of America under the Generalized System of Preferences (GSP), provides preferential duty-free entry to approximately 3,000 products from some 1,423 designated beneficiary countries and territories...The purpose of this program is to encourage the economic growth of beneficiary developing independent countries and dependent countries and territories...Under the United States General System of Preferences (GSP), the cost or value of materials produced in the beneficiary developing country and/or the direct cost of processing performed there must represent at least 35% of the appraised value

of the goods" (ITDS, 2004) (see Section 13.13.6.3, Other agreements).

President Bush announced that the World Bank would give US\$ 200 million in loans to support small business in ten African countries over the next three years. However, he refrained from endorsing calls to end tariffs on key African exports, which the U.S. Congress has been told is necessary if AGOA is to have a chance of being successful (Goldfarb, 2003).

Madsen (1999) believed AGOA, as originally conceived under the Clinton Administration in 1998, was designed to exploit African resources and labor at the expense of both African and American workers. Is this still the case? Time will tell. Are America and its allies moving towards a new win-win policy or is it more of the "same old, same old" win-lose in which Africa is the whipping boy with the costs of doing business externalized through cheap labor and limited environmental controls as a means of maximizing profits (see Section 13.13.4, NAFTA, Maquiladora and the Environment, Lessons for Africa)?

Of the 48 Sub-Saharan African countries (number of SSA countries varies from 46-48 depending on reference), 38 are eligible for tariff preferences under the African Growth and Opportunity Act (AGOA) (Office of The President, 2003; USITC, 2003) (Table 13.8). Of the 38 Sub-Saharan African countries declared eligible for the African Growth and Opportunity Act (AGOA), only slightly more than half had exported goods under the program by mid-2002 (Booker & Colgan, 2004).

Table 13.8: Sub-Saharan African countries designated as beneficiaries under AGOA

Benin	Ghana	Nigeria
Botswana	Guinea- Conakry	Republic of Congo
Cameroon	Guinea-Bissau	Rwanda
Cape Verte	Kenya	Sao Tome & Principe
Central African Republic	Lesotho	Senegal
Chad	Madagascar	Seychelles
Cote d'Ivoire	Malawi	Sierra Leone
Democratic Republic Of Congo	Mali	South Africa
Djibouti	Mauritania	Swaziland
Eritrea	Mauritius	Tanzania
Ethiopia	Mozambique	Uganda
Gabon	Namibia	Zambia
Gambia	Niger	

On December 31, 2002, the DROC (DRC) was added to the eligibility list with delayed implementation of AGOA duty-free-trade benefits. On October 31, 2003, the DRC was granted AGOA preferences. Source: USDOC, "Results of the AGOA Country Review for 2003 Eligibility," found at internet address <http://222.agoa.gov>, retrieved Nov. 14, 2003

Source: USITC (2003) with permission, USITC.

To be eligible, a country must supposedly comply with the following (Office of The United States Trade Representative, 2000):

- Establishment of market-based economies;
- Development of political pluralism and the rule of law;
- Elimination of barriers to U.S. trade and investment;
- Protection of intellectual property;
- Efforts to combat corruption;
- Policies to reduce poverty and increase availability of health care and educational opportunities;
- Protection of human rights and worker rights; and

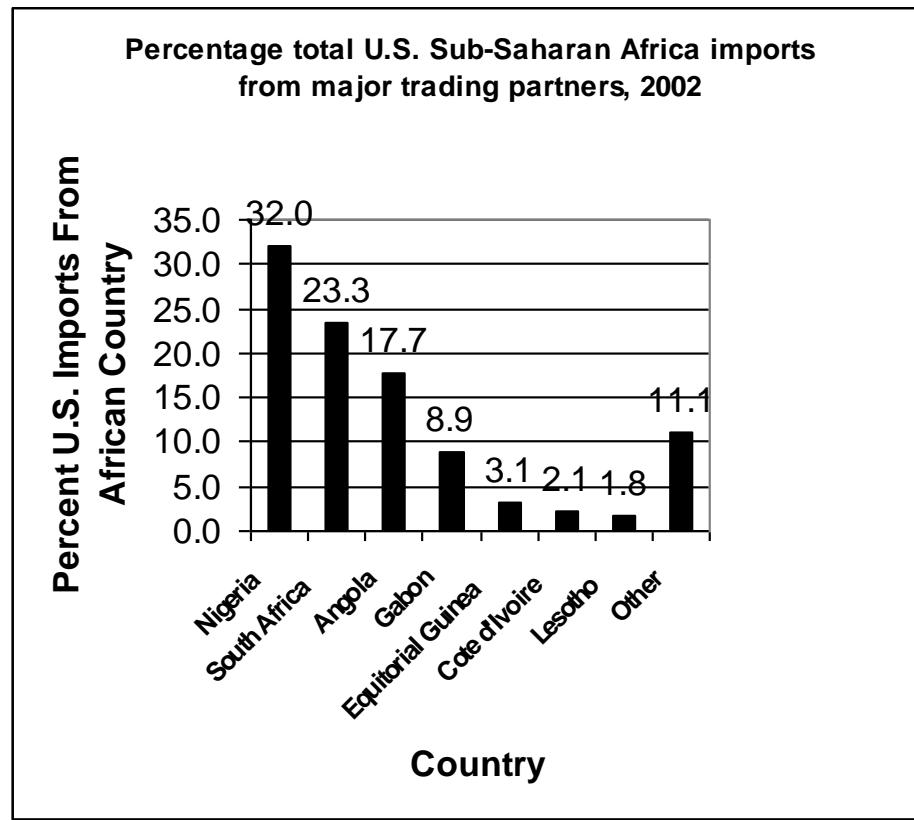

- Elimination of certain practices of child labor. AGOA states that eligible Sub-Saharan African countries must implement their obligations to combat the worst forms of child labor.

Given these requirements, it is surprising that many of the above countries comply, especially with regards to governance (see Chapter 11, Section 11.6, AFRICAN DEMOCRACY IN THE 20 AND 21ST CENTURIES), rule of law, press freedom, corruption, human rights and child labor. It is obvious that AGOA is heavily politicized.

Total 2002 imports to the USA from Sub-Saharan Africa are contained in Figure 13.7. Imports to the USA from Sub-Saharan Africa consisted primarily of oil, coal, minerals and metals (Figure 13.8), that is, raw products.

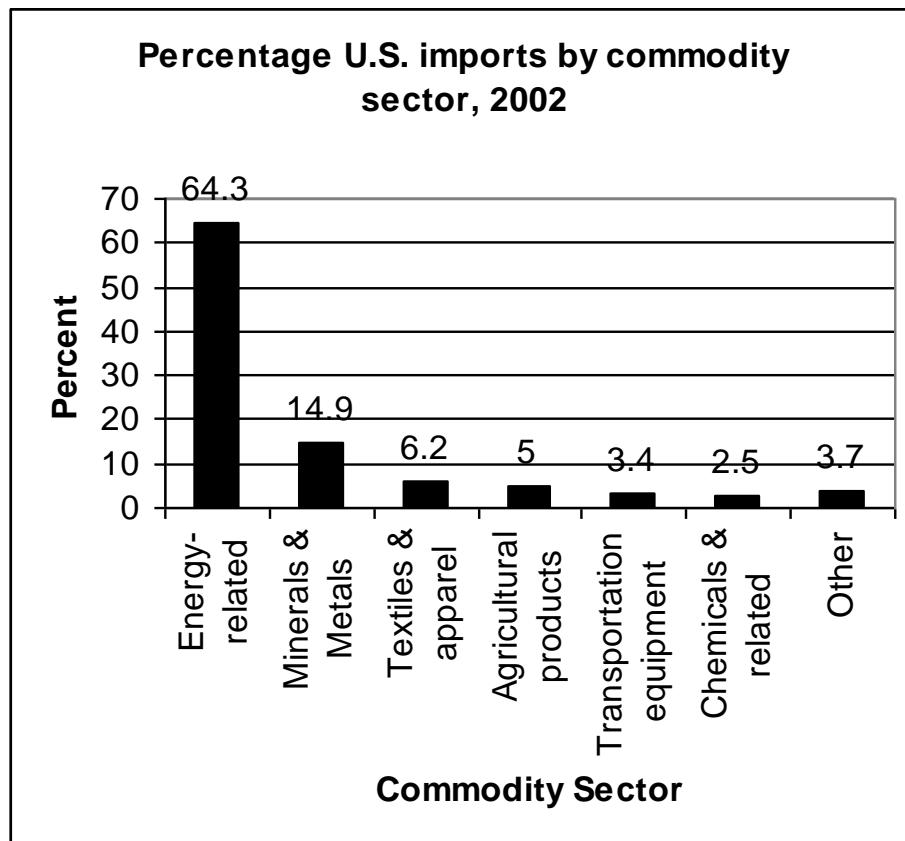

In 2002, imports from Sub-Saharan Africa under AGOA/GSP were about US\$ 9 billion, about 1% of all U.S. imports (Goldfarb, 2003; USITC, 2003), an increase of 9.9% from \$8.2 billion in 2001, with Nigeria (oil) and South Africa being the biggest beneficiaries (USITC, 2003). The largest share of U.S. imports under AGOA/GSP came from Nigeria (60.2%), followed by South Africa (14.9%) and Gabon (13.7%) (USITC, 2003).

Since it started just three years ago, exports from Sub-Saharan Africa that are related to AGOA are worth \$18 billion, creating 300,000 jobs. One of the biggest problems for AGOA and other similar agreements to be successful is to have a continual lifting of import controls for transformed products from Sub-Saharan Africa. For instance, while raw cocoa and coffee can enter the Chinese or European markets with low duty, African chocolates or roasted coffee can not (Wood, 2004)

Source: Extracted from USITC (2003) with permission, USITC.

Figure 13.7: Percentages of U.S. imports by country from major trading partners in Sub-Saharan African, 2002

Source: Extracted from USITC (2003) with permission, USITC.

Figure 13.8: Percent of U.S. Imports from Sub-Saharan African countries by commodity sectors, 2002

According to COMESA (2004),

“AGOA has helped to bolster the U.S. Sub-Saharan African trade and investment relationship. Total trade between the U.S. and the region was nearly \$24 billion in 2002, with U.S. exports of \$6 billion and U.S. imports of \$18 billion. U.S. imports under AGOA were valued at \$9 billion in 2002. By 2003, total trade between the U.S. and the region had jumped to \$25.4 billion, an increase of 9.4% while U.S. African Growth and Opportunity Act (AGOA) and Generalized System of preferences (GSP) imports were \$14.1 billion in 2003. The U.S. direct investment position in Sub-Saharan Africa increased by 5.8% at year end 2001 to \$10.2 billion, boosted largely by investments in the petroleum sector”.

“These imports were dominated by U.S. purchases of energy-related products (e.g., oil) in 2002 (Figures 13.7 and 13.8), which represented 75.9% of total AGOA imports in 2002, down from their 83.5% share of the total in 2001. However, significant increases were recorded for textiles and apparel, which accounted for 8.9% of the total in 2002, up from a 4.4% share in 2001, and transportation equipment, which represented a 6.1% share in 2002, compared with a 3.7% in 2001” (USITC, 2003).

For the most part, other than industrialized South Africa, AGOA benefits are concentrated in a few countries rich in petroleum mineral resources. This trend will increase since Angola became eligible at the end of 2003 (Booker & Colgan, 2004) and now that Equatorial Guinea’s oil is coming online.

Nontraditional export sectors, such as fruits, vegetables, processed food, textiles, vehicles and vehicle parts, as well as appliances, are beginning to make inroads. The automobile and fruit sectors in South Africa and information technology sector in Uganda⁵⁷² are beginning to benefit from AGOA (USITC, 2003).

However,

“restrictions on African access to U.S. markets, and agricultural subsidies to U.S. agribusinesses, continue to undermine Africa’s competitiveness and constrict the continent’s trade-related development” (Booker & Colgan, 2004)

⁵⁷² Rocky Mountain Technology Group, U.S.-based information technology firm plans to create a “cyber city” in Kampala.

Apparel Provisions

This includes:

- Unlimited duty-free and quota-free U.S. market access for apparel made from U.S. fabric, yarn and thread; and
- Duty-free and quota-free U.S. market access for apparel made from yarns and fabrics not available in the United States and capped market access for apparel made from yarns and fabrics produced in beneficiary countries in Sub-Saharan Africa.

AGOA helps apparel makers in Sub-Saharan Africa compete by using the world's most competitive fabrics with options of using locally made materials or, under the Special Apparel Provision, poorer Sub-Saharan African countries can use materials from anywhere – “Third Country Fabric” – even Asian ones. Madagascar, benefiting from the Special Apparel Provision, increased exports of textiles and apparel to the USA in 2001 by almost 83% (ANON, 2002c).

Growth of the clothing industry is a unique phenomenon, but remains concentrated in just a few countries - Mauritius, Madagascar, South Africa, Lesotho and Kenya (Table 13.9), while Swaziland and Namibia are increasing activity in the sector owing to factors such as privatization, increased foreign investment and trade preferences such as AGOA (USITC, 2003). As a result of AGOA, “in less than five years, Lesotho developed a textile industry from nothing to one that employed about 60,000 people”, surpassing the government as the biggest employer in the country “and by 2003 was exporting \$400 million worth of garments to the United States. Lesotho exports more garments to the United States than any other Sub-Saharan country” (Robertson, 2005). AGOA,

with its emphasis on textiles and apparel, (Hayes, 2003; Goldfarb, 2003) shows minimal benefit for the remainder of Sub-Saharan Africa.

Table 13.9: Imports to USA from Sub-Saharan Africa under Africa Growth & Opportunity Act (AGOA)

Country	General	Textiles	Agriculture Fisheries Forestry	Chemicals	Petroleum & Energy	Minerals	Transport Products
Total Value \$US (Million)		803	242	136	6,800	373	533

Extracted from: USTIC (2003) with permission, USITC.

Taiwan, South Korea and Malaysia have climbed the economic ladder through labor intensive cloths manufacturing. Under AGOA, all labor, including the knitting of clothing from bolts of cloth and yarn to cutting, stitching, sewing and finishing, must be performed in Sub-Saharan Africa, precluding semi-finished products from Asia being finished in Sub-Saharan Africa to avoid U.S. import taxes (Lucas, 1999). Total U.S. textile imports from SSA rose 14% in 2002, reaching \$1.1 billion, of which AGOA accounted for US\$ 803 million, up 123% from 2001. This still represents less than 1 % of total sector imports into the U.S. Primary items included cotton sweaters and pullovers and cotton men's and women's trousers (USITC, 2003).

Statistics for 2004 and 2005 may look much different. Because of a stronger Rand, South Africa's share of the textile market diminished in 2002 and 2003 as U.S. customers sourced cheaper Asian products. Lesotho, whose currency, the MaLoti, is pegged to the Rand, has also been hurt. Furthermore, at the beginning of 2005, the "Multi-Fiber Arrangement under which quotas were set, was lifted at the start of this year, as mandated by the World Trade Organization (WTO). As a result countries such as China, while still subject to tariffs and duties, are no longer restricted by quantity" (Robertson, 2005). The Asian countries depreciated their currencies against the U.S. dollar, allowing them to easily out compete the Rand and currencies pegged to it. As a result in Lesotho,

"six Asian-owned factories have closed and returned to their home countries in the past four months, resulting in more than 6,000 job losses, another 4,000 jobs were lost last year" (Robertson, 2005).

South Africa has lost 300,000 textile jobs in the past two years, the South African Textile Federation requesting (Phiri & Nduru, 2005) and the South African government imposing (Hill, 2007) quotas on textile imports, with Chinese clothing representing 86% of the total garments imported into South Africa (Phiri & Nduru, 2005). Clothing exports from China to South Africa rose by 40 percent in the last nine months of 2005 and after protests from the South African government, China has now claimed it will limit the amount to prevent further job losses (Smith, 2006). Other estimates are a loss of 70,000 textile jobs in South Africa over the last four years from low-cost Asian producers, adversely impacting nearly 500,000 people in the family support network (Hill, 2007).

Malawi last 2,411 jobs between January and March 2005, with the closure of one Taiwanese textile factory with 11,000 workers in nine textile factories facing an uncertain future. There are 30,000 jobs at stake in Swaziland with AGOA products constituting 83% of all exports from this country and 50,000 textile

workers exist in Lesotho (Phiri & Nduru, 2005) (see Chapter 12, Section 12.2.4.4, Cotton subsidies and protected markets, Trade Agreements Hurt U.S. Textiles).

Under AGOA, most of the Foreign Direct Investment (FDI) has come from Asia (Taiwan and China) to expand existing apparel production and building textile mills to produce yarn and fabric, enabling apparel producers in the less developed Sub-Saharan African countries to continue qualifying for preferential treatment if the scheduled expiration of the “Third-Country Fabric” provision on September 30, 2004 takes place (USITC, 2003). According to COMESA (2004),

“The Third-Country Fabric provision, which relates to the use of yarns and fabrics from third countries by Least Developed Countries (LDCs) will not be extended beyond 2007 hence the urgent need to mobilize investment in this area. Countries like Zambia need to move fast to ensure that the yarn production capacity is expanded so that other countries in the region could source the required volumes and quality of yarns and fabric from the country”.

In July 2004, the U.S. Senate approved an extension of AGOA from 2008 to 2015 and the “Third-Country” (from outside of Africa – such as India and East Asia) provision on fabric from 2004 to 2007, including a phase down of benefits in year three, at which stage only 50% of AGOA apparel imports could be made from “Third Country Fabric” (COMESA, 2004).

“the AGOA Acceleration Act of 2004 (AGOA III, signed by President Bush on July 12, 2004) extends preferential access for imports from beneficiary Sub Saharan African countries until September 30, 2015; extends third country fabric provision for three years, from September 2004 until September 2007” (U.S. State Department, 2005).

All this has to be set against the backdrop of a 15% fall of total U.S. imports from Sub-Saharan Africa in 2002 (UNECA, 2004). In 2005, clothing and cloth exports from southern Africa appear to be unraveling.

Agricultural, Fisheries and Forestry Products

In order to expand the benefits of AGOA to the rest of Sub-Saharan Africa, it was recommended that America open its doors to African agricultural products (Hayes, 2003).

In this sector, U.S. imports from Sub-Saharan Africa are minor, amounting to US\$ 1 billion in 2002 (US\$ 242 million from AGOA) or 1% of total imports. However, U.S. sector imports from SSA rose by 8% in 2002 compared with the previous year. Major suppliers in 2002 included Côte d'Ivoire (the Ivory Cost) for cocoa beans, vanilla beans, tobacco and coffee, and South Africa for sugar. Principle suppliers under AGOA were South Africa, Malawi and Côte d'Ivoire (USITC, 2003). The principal products imported under AGOA in 2002 were (USITC, 2003):

- Raw cane sugar at US\$ 44 million, or 18% of the total AGOA imports under this category. U.S. imports of raw cane sugar under AGOA increased by \$16 million, or 59% of AGOA imports, in 2002 compared with the previous year, the major supplier being South Africa (47% of the value). Virtually all U.S. imports of sugar from AGOA sources enter under GSP and, although subject to a prohibitive tariff rate quota, the quota for these suppliers was only about 75% filled in fiscal year 2002, leaving room for future expansion.
- Stemmed and stripped tobacco at \$31 million, or 13% of total AGOA imports under this category.

- Leather (HTS 4113.90, mainly of ostrich) at \$17 million, or 7% of total AGOA imports under this category.
- Other major products showing substantial import growth under AGOA in 2002 include certain leather, wood doors, certain nuts and cocoa powder.

South African exports to the U.S. have increased under AGOA, especially oranges, mandarins, canned pears, canned citrus and macadamia nuts. In South Africa, an entrepreneur teamed up with Sunsweet Growers Inc., located in Yuba City, California, to produce sugar-free fruit bars. A specialty firm in South Africa that produces ice cream in coconut shells and other fruit cases landed a contract with a large U.S. retail firm. A major international wine and grape concentrate producer based in the Western Cape of South Africa is opening markets to the U.S. under AGOA, while Kenya is beginning to export fully processed coffee. U.S. Foreign Direct Investment (FDI) in this sector in 2002 was US\$ 113 million, down from a high of US\$ 217 million in 1998 (USITC, 2003).

In 2002, South Africa, with an investment of US\$ 97 million out of a total of US\$ 113 million, continued to be the primary SSA location for U.S. FDI in this sector. The food sector continued to account for a minor share of the total. U.S. Coca-Cola purchased a juice and a bottled water brand from SAB Miller in South Africa for \$13 million, providing Coca-Cola with a 45% share of the bottled water market in South Africa. Coca-Cola also invested \$8.2 million in Kenya to produce a non-carbonated fruit drink. Tanzania is developing an investment incentive package for the processing of traditional export items such as cotton, coffee and cashew nuts, as well as nontraditional items, including fruits, vegetables and flowers. The Seychelles and Botswana received minor U.S. investments of US\$ 4 million and US\$ 3 million respectively (USTIC, 2002).

Chemicals

South Africa continues to lead SSA in the production of chemicals, supplying 60% of the total, with organic chemicals as the leading product category accounting for 45% of the total. U.S. imports of chemicals under AGOA totaled \$136 million in 2002, with South Africa supplying nearly all sector imports under AGOA (99%), including major products such as silicon and titanium dioxide pigments (USITC, 2003) (Table 13.9).

The 2002 U.S. Foreign Direct Investment (FDI) in the chemical products sector amounted to US\$ 591 million, up from US\$ 215 million in 1998. South Africa continued to be the primary SSA location for U.S. FDI in the sector, accounting for 93% of the regional total. Dow South Africa (Dow SA) is reported to be divesting a number of chemical plants, thus far selling off plants producing calcium carbide, mining chemicals and synthetic rubber. This amounted to US\$ 550 million invested in South Africa with minor amounts invested in Nigeria (US\$ 13 million), Zimbabwe (US\$ 12 million), Kenya (US\$ 10 million), Zambia (US\$ 5 million) and Mauritius (US\$ 1 million) (USITC, 2003).

Petroleum and Energy Related Products

Crude petroleum from Nigeria and coal from South Africa continue to be the primary petroleum and energy-related products produced in SSA. Angola remains the region's second largest producer of crude petroleum behind Nigeria. Under AGOA, Nigeria and Gabon provided 79% and 17% respectively of the imports (see Table 13.9). The U.S. FDI in SSA was US\$ 3,471 million (3.471 billion) in 2002 down from the US\$ 4,600 million in 2001 (USITC, 2003).

As the major U.S. FDI sector, this sector received 41% of U.S. FDI in Sub-Saharan Africa in 2002. This included Equatorial Guinea (US\$ 1,648 million), Nigeria (US\$ 824 million) and Gabon (US\$ 467 million), together accounting for 85% of the regional total of US\$ 3,473 million. This amounts to only 4% of the U.S. FDI in this sector globally (USTIC, 2003), though with all the problems in the Middle East, investment is expected to increase significantly (USITC, 2003).

Minerals and Metals

South Africa continued to dominate the region's exports (US\$ 2.7 billion) to the United States in 2002. South Africa's decrease in exports to the USA in this sector by US\$ 327 million in 2001 is due to decreased exports of gold bullion and ferronickel, reflecting general market conditions. Botswana's exports to the U.S. increased as the result of the sourcing of raw diamonds away from Sub-Saharan Africa's conflict regions and Botswana's high ranking in the Transparency International Corruption Index. While sectoral U.S. imports declined overall in 2002, imports under AGOA increased to US\$ 373 million primarily from South Africa (Table 13.9) and Kenya, with ferroalloys accounting for the majority of imports, along with a significant increase in aluminum and finished products as the result of processing investments in western Sub-Saharan Africa (e.g., Guinea) (USITC, 2003).

The 2002 U.S. FDI in SSA in the mineral and metal sector was US\$ 56 million, down from US\$ 71 million in 2001. Ghana was the major SSA location for U.S. FDI in the sector in 2002, accounting for 82% (US\$ 46 million) of the regional total (US\$ 56 million). The sector accounted for less than 1% of the total U.S. FDI position in SSA in 2002, and SSA accounted for less than 1% of the global U.S. FDI position in the sector that year. When contrasted with the U.S. mining

FDI, the mining sector of SSA is receiving little investment from U.S. sources (USITC, 2003).

Anglo-American PLC pulled out of the Konkola copper mining facilities (Zambia) in 2002. Mozambique's Mothalala aluminum smelter, which is the country's largest single investment (US\$ 1.3 billion), expanded, setting world production records (see Chapter 7, Section 7.11.7.3, Kariba and Cahora Bassa Dams, Zambezi River). Anglo-American's Zimbabwe platinum project, Unki Mine, issued US\$ 90 million in tender offers for development (USITC, 2003).

Factors posing a deterrence to new investment and reinvestment in Sub-Saharan Africa include political stability and potential for re-nationalization, as well as health risks, including malaria and the increasing HIV/AIDS rate, raising employee health costs and thus diminishing the financial attractiveness of potential investments. Especially health issues make it difficult to find suitable foreign technical professionals to move to the region to manage operations (USITC, 2003). In such cases, nationals must be trained-up to take these positions.

South Africa's new Mineral Law gives the government ultimate ownership of all of the country's mineral resources. Licenses will be issued for up to five years for prospecting rights and up to 30 years for mining rights, with the expressed purpose of creating more black ownership. Although the government claims there will be automatic conversion of the "old order rights" to "new order rights", there may be a temporary drop in investment while the details of the law regarding paying for the asset rights are worked out (USITC, 2003).

Transportation Materials

South Africa is the dominant producer of motor vehicles and motor-vehicle parts in the SSA region, accounting for 96% of SSA motor vehicle production in 2002; 99% under AGOA (Table 13.9). The automotive industry in South Africa accounts for nearly 6% of its GDP and 10% of its total manufacturing. It is comprised of foreign subsidiaries and local-foreign joint venture operations. BMW, Daimler-Chrysler and Nissan benefit from AGOA, with the motor vehicle manufacturing industry employing 33,000 and the component manufacturing industry employing 60,000 people (USITC, 2003).

In 2002, the United States ran a US\$ 257 million deficit in certain transportation equipment trade with SSA. Passenger cars accounted for 84% of total U.S. sector imports from South Africa, while imported components included road wheels, engine parts, shock absorbers, mufflers and exhaust pipes. U.S. imports of transportation equipment, mainly passenger vehicles, under AGOA, all came from South Africa, increasing by 85% in 2002 to US\$ 533 million, with AGOA imports accounting for 95% of total U.S. sector imports from Sub-Saharan Africa. The South African automotive industry is the leading exporter in this sector under the AGOA program, with the component manufacturing industry seeking technology-sharing with foreign partners (USITC, 2003).

U.S. Foreign Direct Investment (FDI) in the transport sector in 2002 for SSA was US\$ 328 million up from US\$ 248 million in the previous year. All of this investment went to South Africa. In 2002, the Gauteng provincial government committed to investing some \$100 million to establish an automotive supplier park in Rosslyn, South Africa, that will accommodate 200 facilities of varying sizes for suppliers of a variety of components. Ford has become the full owner of Ford Motor Co. of southern Africa (FMCSA). General Motors owns 49% of Delta

Motor Corp., which assembles Isuzu and Opel (GM's/General Motors European vehicle line) vehicles at two plants. BMW is upgrading its South African facilities with an installed capacity of 60,000 vehicles per year. In 2002, Toyota Motor Corp., which owns 74.9% of Toyota South, provided \$100 million in capital improvements in preparation for production of new generation Corollas, including South Africa in its global supply network with plans to more than double its export capacity to 200,000 vehicles per year by 2005 (USITC, 2003).

Other

A major South African appliance manufacturer and distributor announced the expansion of its manufacturing facility in Cape Town in order to keep up with the export demand of a U.S.-based appliance brand. South African exporters have begun to export several new products since the AGOA program, including fishing rods (USITC, 2003). Complimenting AGOA, the U.S. Government has various trade capacity-building initiatives amounting to US\$ 106.5 million dollars in 2002 to Sub-Saharan Africa (Table 13.10). However, in order to achieve these goals, then Secretary of State Colin Powell told African politicians at a meeting of the Corporate Council on Africa that they must attack corruption, warning that capital is a "coward" that shuns uncertainty and crime. It flees war and disease and it will not go near corruption (Goldfarb, 2003).

Table 13.10: U.S. support for building trade capacity, by geographic region, FY 1999 – FY 2002 (Millions dollars)

Region/Country	FY 1999	FY 2000	FY 2001	FY 2002
Middle East & North Africa	21.1	110.4	118.3	147.1
Asia	48.5	69.7	114.3	109.9
Sub-Saharan Africa	80.5	94.7	64.1	106.5
Former Soviet Republics	97.4	84.0	97.6	72.1
Central & Eastern Europe	56.6	29.4	38.9	63.4
Latin America & Caribbean	52.4	65.0	61.6	90.8

Overall Trade Deficit between USA and SSA

Overall, the U.S. trade deficit with SSA reflects its needs for primary products from this continent, especially oil. In 2002, the U.S. merchandise trade deficit with SSA decreased by \$2.0 billion to \$12.3 billion, compared with deficits of \$14.3 billion in 2001 and \$16.7 billion in 2000. The SSA country with which the United States had the largest trade deficit in 2002 remained Nigeria, measured at \$4.8 billion, down from \$8.0 billion in 2001; followed by Angola (\$2.9 billion in 2002, up from \$2.5 billion in 2001), South Africa (\$1.8 billion in 2002, up from \$1.6 billion in 2001) and Gabon (\$1.6 billion in 2002). South Africa is the only major country where U.S. trade deficits are not due to oil. On a sectoral basis, the largest U.S. trade deficit with SSA occurred in energy-related products, with a deficit of \$11.5 billion in 2002, down from \$14.1 billion in 2001. Second were minerals and metals, with a deficit of \$2.4 billion in 2002, down from \$2.8 billion in 2001. The U.S. trade deficit in textiles and apparels increased to \$1.0 billion in 2002 from \$868 million in 2001 (USITC, 2003).

13.13.6.3 Other agreements

The EU Cotonou Agreement for African Caribbean and Pacific (ACP)

“is a very open scheme, with enhanced preferences beyond those in the GSP scheme, and with protocols for bananas, beef, veal and sugar. This incorporates all of SSA excluding South Africa” (Commission for Africa 2005).

Under the Cotonou Agreement products covered by the Common Agricultural Policy (CAP) still face customs duties.

The EU’s “Everything but Arms (EBA)” (Regulation (EC) 416/2001, February 2001) initiative of duty-free and quota-free entry for all products (except arms) for LDCs includes 34 African countries. Although access to the EU markets for agricultural products may no longer be a major problem for African LDCs, a number of factors may impede African preferential access. This includes rules of origin and standards such as sanitary/phytosanitary requirements and other technical barriers to trade (NEPAD, 2002).

“Only imports of fresh bananas, rice and sugar are not fully liberalized immediately. Duties on those products will be gradually reduced until duty free access will be granted for bananas in January 2006, for sugar in July 2009 and for rice in September 2009. In the meantime, there will be duty free tariff quotas for rice and sugar (see the latest regulations for sugar quotas No 1381/2002 and rice quotas 1401/2002 in the list of legislation). The EBA Regulation foresees that the special arrangements for LDC's should be maintained for an unlimited period of time and not be subject to the periodic renewal of the Community's scheme of generalized preferences. Therefore, the date of expiry of Council Regulation (EC) No 2501/2001 does not apply to its EBA provisions” (EU, 2004).

The tariff on bananas will be reduced 20%/year between January 1, 2002 and January 1, 2006, with the 2002 quota being 544 EUR/1,000 kg (i.e. 80% of the Most Favored Nation (MFN) duty of 680 EUR/1,000 kg). Customs duty for rice will see the tariff reduced to zero between September 1, 2006 and September 1, 2009. In the interim, rice can come in duty free under a tariff quota, growing 15%/year between 2001/2002 and 2008/2009 respectively, from 2,517 tons to 6,696 tons. Full trade liberalization of sugar will be phased in between July 1, 2006 and July 1, 2009, gradually reducing the full EU tariff to zero. In the meantime, sugar can come in duty free within the limits of a tariff quota, from 74,185 tons in 2001/2 to 197,335 ton in 2008/9 (Table 13.11) (UN, 2002).

Table 13.11: Summary of the European Union “Everything but Arms (EBA)” initiative

	Pre-EBA	EBA
Product Coverage	<ul style="list-style-type: none"> • All GSP covered products • Additional list of products for LDCs only • Certain sensitive agricultural products excluded 	All products but arms (HS Ch 93)
Depth of Tariff Cut	<ul style="list-style-type: none"> • Duty-free for all GSP covered products • For the additional list of products, different tariff cuts available according to the import sensitivity of products (four products categories) • No preferences on the specific component of MFN duties, on entry price, on the agricultural component and on other duties 	<ul style="list-style-type: none"> • Duty-free for all products • All duties entirely • Delayed (phased-in period). Trade liberalization for bananas, sugar & rice
Rules of Origin	Regulation 1602/2000	Regulation 1602/2000 but ACP LDCs moving into EBA may lose ACP

Source: UN (2002) with permission, UN.

“In 2003 Canada expanded its GSP scheme to cover substantially all products from LDCs, including textiles and clothing, with the exception of a limited number of products (eggs, poultry and dairy), along with liberal rules of origin. In 2000 and 2003, Japan has progressively expanded the number of industrial and agricultural products from LDCs receiving duty-free access. This

covers 31 SSA LDCs except for Djibouti and Comoros” (Commission for Africa, 2005).

Stiglitz (2002) believes this is a start, but still puts developing countries at a competitive disadvantage due to competing with EU agricultural subsidies (see Chapter 12, Section 12.2.4, Agricultural Tariffs and Subsidies). Modeled benefits to Sub-Saharan Africa from liberalizing OECD agricultural markets show losses to Sub-Saharan and southern Africa when partial trade liberalization is carried out largely due to the impact of preference erosion, with many African countries being major beneficiaries of existing preferential trading arrangements (e.g., beef from southern Africa and sugar from Mauritius under the Lomé Convention). The gains from full liberalization increase from US\$ 704 million in the static model to US\$ 4.3 billion in the dynamic model, associated with the impact of capital accumulation. This indicates the importance of complementing trade liberalization with investment (FDI) enhancing policies. However, it was found that the reforms may force countries to specialize more in the production of agricultural commodities, indicating the urgency of adopting policies to promote export diversification out of primary commodities and into industrial and service industries with a higher value-added (UNECA,⁵⁷³ 2004). Relying on primary commodities, as discussed in Chapters 5 and 12, indicates that

“price volatility, arising mainly from supply shocks and the secular decline in real commodity prices, and the attendant terms-of-trade losses have exacted heavy costs in terms of incomes, indebtedness, investment, poverty and development” (UNECA, 2004).

⁵⁷³ United Nations Economic Commission for Africa (UNECA).

13.14 NEPAD

With the “New Partnership for Africa’s Development (NEPAD), African governments have clearly recognized the weaknesses in their public institutions and the need for better governance as well as the changes that need to be brought about. They have, in this context, established a peer review mechanism in order to encourage compliance” (UNCTAD, 2002b).

“NEPAD recognizes that to achieve the estimated 7% annual growth rate needed to meet the Millennium Development Goals—particularly the goal of reducing by half the proportion of Africans living in poverty by the year 2015—Africa needs to fill an annual resource gap of 12% of its GDP, or \$64 billion a year, with the bulk coming from outside” (World Economic Forum, 2004).

The G-8 has endorsed NEPAD as part of an African Action Plan, with the idea that foreign investment is more important for development than foreign aid. This will require societies attractive to investors, compelling African governments to embrace stability, the rule of law and good governance (CNN, 2002b).

NEPAD “calls for the privatization of social services, a further shift towards export oriented economic growth, and public private partnerships to increase the efficiency with which scarce resources are used. The thinking is that Africa’s integration into the global economy will alleviate widespread poverty, because Africans will be able to work in export industries, and thus buy food” (Patel & Delwiche, 2002).

With the current level of poverty in Africa, many people are concerned that the privatization of social services (e.g., water, education, health) prior to having an affluent middleclass will further impoverish the majority of Africans, holding back the development of the continent. How this takes place must be analyzed carefully. Certainly, much of these services are supported wholly or partially by the state in the U.S. and EU countries.

Leading business organizations in North America, Europe and Africa, spearheaded by the International Chamber of Commerce and the African Business Roundtable, have set up a NEPAD business group with the idea that governments will involve the private sector more closely in devising and implementing their programs. In order to increase investment that will generate economic growth and wealth creation, thousands of first time investors will have to be introduced to Africa. Regulatory and economic policies coming from some of the world's foremost business organizations will boost investor confidence. The NEPAD business group submitted a detailed seven year plan to create reliable capital markets in Africa with a healthy investment management industry (Hampshire, 2002).

NEPAD is also being criticized.

"Patrick Bond, professor at the University of the Witwatersrand (now with University of KwaZulu-Natal School of Development Studies) in Johannesburg and others attack the lack of democracy in the NEPAD process: 'During the formulation of NEPAD, no civil society, church, political party, parliamentary, or other potentially democratic or progressive forces were consulted' " (Patel & Delwiche, 2002).

Bond (2002) is concerned that NEPAD has adopted neoliberal policies of the IMF and World Bank (e.g., privatization of social services, continued export of raw products) disguised under sustainable development rhetoric. He believes that NEPAD has been negotiated between governments, the private sector and the West, without input from civil society, with the result that NEPAD will not serve the continent's poor.

Similarly, Booker, Minter and Colgan (2003) conclude that NEPAD policies are

“failed economic policies and programs of the World Bank (e.g., structural adjustment) and rich-country governments while neglecting to lay the basis for the democratic participation of African people”.

Several groups, including the Economic Justice Network, the Third World Network-Africa, the Secretariat of the Gender and Trade Network in Africa, and the Alternative Information and Development Centre, say this:

“ ‘In essence, the document is an attempt to negotiate with Northern powers the terms of Africa’s integration into the world economy without challenging the systemic and structural dynamics by which globalization has further marginalized and created polarization within Africa, both within individual African countries and between them’ ” (Patel & Delwiche, 2002).

In short, NEPAD seems to be a plan for elites in Africa and elsewhere to mine the resources of the continent and its people. In fact, the reason many African countries are in such a perilous state is because they have been following NEPAD-like policies for the past 20 years. It is hardly likely that more of the same toxin will cure the continent (Patel & Delwiche, 2002). According to the World Economic Forum (2004), NEPAD is based on Poverty Reduction Strategy Papers (PRSPs). As noted in Chapter 12 (see Section 12.5.1, The HIPC Initiative - Half-hearted, Inadequate, Piecemeal Cancellation “Debt Relief”), PRSP’s have been attacked for still incorporating failed structural adjustment policies and a failure to adequately involve civil society in their preparation. “Is this a wolf in sheep’s clothing”? Let everyone hope that these criticisms are wrong. NEPAD must avoid the failed structural adjustment policies of the Washington Consensus at all costs (see Chapter 12).

There is also concern that the leader of NEPAD, South Africa, by ignoring the flawed 2000 election and continued human rights atrocities by Zimbabwe's ruling party – ZANU-PF – (see Chapter 5, Section, 5.7.4.1 Politicization of land reform in Zimbabwe, impacts on food production, the economy and wildlife) is compromising the legitimacy of NEPAD and, in return, a willingness by the global community to invest in what is perceived as a volatile and insecure continent where sizable investments can be lost if a country slips into anarchy. Abdoulaye Wade, President of Senegal and one of the co-authors of NEPAD, has criticized its implementation to date as supporting dictators and tyrants (Bond, 2002). If the NEPAD process is to work and confidence by foreign investors is to take place, it will be necessary for the African Union to develop honest internal reviews of the continent's move towards some sort of open society and acceptable democratic process, even if Africanized and not fitting the cookie cutter model imposed by the West, but which allows for the voice of the people to be heard; transparency in how the country's wealth is invested, as well as an orderly transition of power.

On the positive side, NEPAD's leader South Africa has 1) Maintained a strong currency, some say too strong for the export market of many transformed products, 2) Minimized the dumping of subsidies from the West that would destroy agriculture and 3) Said that it welcomes foreign aid, but will use its experts and purchase South African made products – being wise to how foreign aid has stimulated Western economies and failed to find appropriate solutions to Africa's development problems. Although criticized in the press and in writing (Bond, 2002), South Africa is also dealing with the problems of a massive under class as it brings about transformation by assuring that, where utilities exist, every person is guaranteed a minimum of 6,000 liters of water/month and 50 kilowatt hours/month of electricity. In the poorer townships, “pay as you go” meters exist for these utilities, so as with cell-phones, people can carefully control their

consumption. By 2003, 26 million of South Africa's 45 million people had piped water (Guest, 2004). In 2004, President Thabo Mbeki had promised that all households will have running water within five years and electricity within eight years. Sachs (2005) supports these "lifeline tariffs" for the poor in which a minimum of free water and power are guaranteed after which these resources are paid for on a metered basis.

Former all-white universities are opened to all races and special scholarship funds are being provided for scholars from low-income families to attend university. Therefore, it seems that to some degree, South Africa is marching to its own drums and not that of the West.

South Africa's biggest challenge is trying to find work for between 3.6 million (actively looking for work) to 6 million (includes those given up looking for work) people in 2001, a respective rise from 1.6 million (actively looking for work) to 3.2 million (active and given up) unemployed in 1994 (Guest, 2004). This will require a combination of training and Foreign Direct Investment (FDI), the same that is necessary for the entire subcontinent. Environmental Impact Assessments/Statements (EIA/EIS) must be part of the investment process to assure protection of the worker and natural systems (see Chapter 7, Section 7.8.3, Environmental Impact Assessment (EIA) Industry – No Hippocratic Oath). NEPAD must go hand-in-hand in addressing educational (see Chapter 11, Section 11.13.1, Education) and health issues (see Chapter 11, Section, 11.13.2, Health in Sub-Saharan Africa at the Beginning of The New Millennium). Additional political and technical challenges South Africa must overcome are summarized in Chapter 11, Section, 11.6.6.3, South Africa's democracy, a possible decentralized model adapted to Africa. It's free press, technological know how and economic diversity give one confidence that it will succeed.

13.15 NEED FOR THE WEST AND WTO TO LOWER TARIFFS, SUBSIDIES AND OTHER PROTECTIVE MEASURES IF NEPAD AND AGOA ARE TO WORK

Efforts to rectify trade imbalances should continue. As discussed in Chapter 12, current negotiations must eliminate the combination of agricultural protectionism and high subsidies in industrialized countries that have limited agricultural growth in the developing world, as well as weakened food security in vulnerable countries, by putting their domestic production at a disadvantage (Díaz-Bonilla & Robinson, 2001; Legum, 2002).

13.16 NEW MILLENNIUM CHALLENGE ACCOUNT

“On March 14, 2002, with the events of September 11 fresh in the nation’s mind in the midst of the war on terrorism, President Bush addressed the Inter-American Development Bank and announced the creation of a \$5 billion (over 3 budget cycles) Millennium Challenge Account. To quote from the President’s speech, ‘The growing divide between wealth and poverty, between opportunity and misery, is both a challenge to our compassion and a source of instability. Even as we fight to defeat terror, we must also fight for the values that make life worth living; for education and health and economic opportunity.’ The President was clear, however, that the new funds would be used for countries that root out corruption, respect human rights and adhere to the rule of law, as well as encourage open markets and sustainable budget policies” (Natsios, 2002).

Sachs (2005) maintains that to meet Millennium Development Goals, poor countries of the World need US\$ 100 billion/year between 2006 and 2015 (see Section 13.12.5, Poor Track Record in Achieving United Nations “Millennium Declaration” Goals). Similar to AGOA requirements, the President proposed three standards to judge this performance (Natsios, 2002):

- “The central importance of policies that encourage economic freedom, private investment, and entrepreneurship...
- The central importance of good governance to economic growth and development...
- The demonstrable commitment by Third World countries to invest in health and education and to ensure effective delivery of services. Countries with high rates of sustained economic growth have consistently invested in health and education services for their people, helping create a work force for a growing economy”.

President George W. Bush (2002) has acknowledged in a speech that poverty is broad and seemingly inescapable, leaving a dark shadow across a world increasingly illuminated by opportunity, with 50% of the world living on less than US\$ 2/day, with poverty increasing and per capita income falling in Africa and the Islamic world. The growing divide between wealth and poverty is both a challenge to our compassion and a source of instability. Poverty does not cause terrorism, most of the plotters of September 11th being raised in comfort. Yet persistent poverty and oppression can lead to hopelessness and despair and when governments fail to meet basic needs, failed states can become havens for terror. Development is not always easy, but the conditions required for sound development are 1) Security and 2) Financing, with most funds for development coming from domestic capital, from foreign investment and especially, from trade not foreign aid. Trade is the engine of development, helping to meet the needs of the world’s poor. Old models of economic development assistance are outdated, needing legal and economic reform, including an end to corruption, protection of private property, open markets (will the USA and EU open theirs?), appropriate monetary and fiscal policies and enforceable private contracts. Unless these reforms are in place, President Bush agrees that more aid money can actually be counterproductive, subsidizing bad policies, delaying reform and crowding out private investment. A new vision looks beyond arbitrary inputs from the rich and demands tangible outcomes for the poor. America supports the international

development goals in the UN Millennium Declaration and calls for a new compact for global development, defined by new accountability for both rich and poor nations alike. Greater contributions from developed nations must be linked to greater responsibility from developing nations. The new Millennium Challenge Account will help fight HIV/AIDS, bring computer instruction to developing nations, will assist African businesses to sell goods abroad, will provide textbooks and training to students in Islamic and African countries and will apply science and technology to increase harvests (Bush, 2002). It sounds good President Bush, but talk is cheap. We need to see action. So far, of the 10 to 15 countries expected to qualify, only three are from Africa: Uganda, Senegal and Ghana (Booker, Minter & Colgan, 2003; Booker & Colgan, 2004).

13.17 INTEGRATION OF SUB-SAHARAN AFRICA INTO THE INFORMATION AGE

“Africa provides the oil, helps us with human intelligence, helps with our access to the Middle East so we can have a forward presence. Our tradeoff has to be to help develop Africa with what makes our country work: transportation and information technology. That is the new deal I hope we can get out of this for Africa and the United States. That is where I think our national security interests are”. (Representative William Jefferson (Democrat-Louisiana) *In: AOPIG, 2002*).⁵⁷⁴

⁵⁷⁴ Although this statement makes sense, it should be noted that on June 4th, 2007, Congressman William Jefferson was indicted by the United States District Court on charges of racketeering (MSNBC, 2007; U.S. District Court, 2007), soliciting more than US\$ 400,000 (MSNBC, 2007) in bribes, wire fraud, money laundering, obstruction of justice and conspiracy (MSNBC, 2007; U.S. District Court, 2007) providing official assistance and using his staff and position as a U.S. Congressman to aid U.S. companies looking to do business (telecommunications, satellite transmission, sugar factory, oil exploration rights, fertilizer plant, waste recycling) in Nigeria, Ghana, Equatorial Guinea, Sao Tome & Principe, Cameroon, Botswana and Republic of Congo. In return, he is charged in seeking things of value such as “monthly fees or retainers, consulting fees, percentage shares of revenue and profit, flat fees for items sold, and stock ownership in the companies seeking his official assistance” (U.S. District Court, 2007).

Hoogvelt (2002 *In: Zack-Williams, et al.*, 2002) argues that Africa lacks the requisite infrastructure to enter into the information age and is thus excluded from the newest international division of labor. It is described how a doctor in America, using the internet, will have his correspondence and bank reports typed by a fleet of secretaries in India and receive the finished product via cyberspace. Many British Bank help lines use South Africans, costing 25% of a Briton, since their cost of living in dollar or pound terms is lower to achieve the same quality of life (purchasing power parity) or better (Guest, 2004). “There are more than 400 call centers in South Africa employing 80,000 people” (Commission for Africa, 2005). Many leading international companies, such as IKEA, Benetton and Nike, have global internets allowing them to subcontract economic activities to suppliers in a huge electronic market of suppliers.

Africans are fascinated by and very good at using computers, but Sub-Saharan Africa, other than South Africa, is currently switched off, though this is changing rapidly with internet cafes in many small towns (Hoogvelt, 2002 *In: Zack-Williams, et al.*, 2002).

This will require more than just sending children to school, but will require a major upgrade in the quality of primary and secondary school teachers and the materials made available to them, including linking children into the information age through the internet so that they grow up with information technology (IT). Currently, Africa is the least connected continent in the world with about 7 million internet users in 2002 compared to 10.5 million in Oceania, 35.5 million in Latin America and the Caribbean, 143.9 million in Asia (except Japan), 57.2 million in Japan, 166.4 million in Europe and 170.2 million in the USA and Canada (ILO, 2004).

This needs to change with a partnership from the West in helping to uplift Africa.

For those who fear that outsourcing will have a negative effect on America's economy, a study by the McKinsey Global Institute found that for every US\$ 1 outsourced, the United States gained US\$ 1.12 – 1.14, while the outsourced country captured just 33 cents of the total gain, thus a win/win situation for both economies (Bartlett, 2003).

Museveni and the U.S. Agency for International Development (USAID) administrator, Andrew Natsios, have signed a US\$ 14.3 million deal that would make Uganda the regional information technology center. The US\$ 14.3 million deal, which includes the establishment of ten network academies within Uganda's university system, is partially funded by the Leland Initiative; a U.S. Government effort aimed at connecting African nations to the Internet. An information technology partnership between the U.S. Government, Uganda and the private sector is helping President Yoweri Museveni position his country as a major player and regional center for the computer services market in Sub-Saharan Africa (Museveni, 2003b). South Africa is already there. "Senegal and Ghana have also opened some call centers in the past year" (Commission for Africa, 2005). Hamadoun Touré, secretary-general the U.N. International Telecommunication Union, expects IT companies to invest US\$ 300 billion in Africa's telecommunications industry over the next five years (King, 2007b).

13.18 SUB-SAHARAN AFRICA'S FUTURE

Africa is in a new political phase, variously referred to as a "second independence struggle", a "third wave" of change, or, as popularized by South Africa's then Deputy President (and in June 1999, President) Thabo Mbeki, an "'African Renaissance.'" A common theme throughout the continent today is that a critical mass of Africans is being organized with new dynamism, new demands and new

expectations. The current generation, which has come of age in the post-Cold War, post-Apartheid era, is determined to fulfill the promises of widely shared economic progress, democratic rights for all, and security that will enable ordinary people around the continent to pursue their own dreams in peace. It should be no surprise that the transformation of African national and state structures, still largely derived from colonial models, remains unfinished (IRC, 2001).

Cliffe (2002 *In: Zack-Williams, et al.*, 2002) provides examples of “African Alternatives” to the Western “Cookie-Cutter Approach” to multi-party structures of governance and so-called democracy, which are often at very superficial levels. Examples emerging out of liberation movements include Ethiopia, Eritrea, Rwanda and Uganda. Museveni’s no-party Democracy (see Chapter 11, Section 11.6.6.2, Uganda, democracy, civil war and attempts to find an African solution) and South Africa’s decentralized system of governance (Chapter 11, Section 11.6.6.3, South Africa’s democracy, a possible decentralized model adapted to Africa) are attempts at finding an African solution to governance.

Success will also depend in large part on whether African realities and priorities are recognized in decision-making arenas in multinational and rich-country institutions (IRC, 2002).

While there are many initiatives, including human rights, social justice, peace and economic development leading to sustainable and equitable improvement in the quality of African life, they are not yet coherent enough or powerful enough to break through the old patterns of how the outside world deals with Africa. There is a pervasiveness of simplistic stereotypes and one-size-fits-all remedies. What is indispensable for constructive outside involvement is a greater sensitivity to the diversity and complexity of African realities. Achieving economic growth is

indeed indispensable for achieving other goals, requiring greater competitiveness and freedom from inefficient or corrupt bureaucratic restrictions. Growth will be neither sustainable nor fair unless it (IRC, 2001):

- Is directed toward job creation and poverty reduction;
- Produces for domestic and regional consumers and not only for international markets;
- Is under girded by public investment in health and education; and
- Is protected from abuse of worker rights (with salaries that are adequate enough to help create a blue collar middleclass, while still providing adequate profits to the private sector) and the environment (worker environment, land, water, air, groundwater, etc.).

Market integration - without other structural changes (e.g., industrialization, road and other infrastructure, investment incentives such as good governance, investment security, free flow of FOREX and reasonable employment laws) - leaves Sub-Saharan Africa dependent on a small number of export commodities – mostly raw, deeply in debt and capable of attracting only a small fraction of world investment capital (IRC, 2001).

Sub-Saharan Africa's economic output, measured by its “equivalent purchasing power⁵⁷⁵“, is the smallest of any developing region. High growth projections assume the economy expands at 4.5% annually, the low growth projections at 2% annually (CALTECH, 2002). Under the optimistic high growth projection, the region's economy in 2050 would be about the same size as the current U.S. economy. The region's prosperity or average annual income (as measured by per capita GNP), even in the best case, is unlikely to reach \$6,000 per person (with

⁵⁷⁵ Purchasing power of money is measured by the quantity and quality of products and services it can buy, also called buying power. Compares relative buying power of incomes between countries.

high economic growth and low population growth). In the worst case, with slow economic growth and rapidly rising populations, average incomes might actually decline over the next 50 years (CALTECH, 2002).

As Natie Oelofse (*pers. comm.*)⁵⁷⁶, a well known safari operator, said while being treated for cancer, “No doctor can tell you that your time is up. That’s between you and God”! Economists are notorious for widely varying projections. Africa’s people and God, along with its traditional beliefs, will determine the future of the continent. A development pyramid with health and education as a base backed by transparent, representative and accountable governments, along with an economy driven by the private sector can likely adjust these figures to much higher. Revolutions and paradigm shifts can occur and this is what it will take, a technological and ideological revolution, if the economies and quality of life in SSA are to significantly change for the better.

13.18.1 Going Local Where Necessary, Development of Regional Markets

Just as in the USA and Europe, there may be certain local industries, which are labor intensive that need protection. The recent refusal of South Africa in July 2003 to allow the USA to dump subsidized food into RSA as part of a free-trade agreement is an example of protecting South Africa’s farm economy and its and the region’s food security. Unfortunately, by mid-2004, South African importers were bringing in wheat from the USA cheaper than their own farmers could produce it. This is likely based on both production and export subsidies in the USA (see Chapter 12, Section 12.2.4, Agricultural Tariffs and Subsidies) adversely impacting global grain prices, even if the food is not dumped as in the

⁵⁷⁶ Natie Oelofse, Managing Director, Wengert Windrose Safaris, Arusha, Tanzania, natie.oelofse@tgts.com. Passed away in June 2005 from cancer.

U.S. PL-480 Food for Peace Program (see Chapter 11, Section 11.8.3.1, “Food for Peace” or “food for poverty”, Western donor impacts on food production and wildlife management in Laikipia Kenya and Section 11.8.8, Food Aid and Impacts on Grain Production in Southern Africa). In a purely free-market, non-subsidized South African farmers cannot compete against subsidized American farmers in the international market and are thus out-competed in their own country.

Some people say going local does not mean walling off the outside world. It means nurturing businesses that use local resources sustainably, that employ local workers at decent wages (e.g., creates a blue collar middleclass) and that serve primarily local consumers (Legum, 2002). It means becoming more self-sufficient and less dependent on imports (Dumont, 1966). An excellent example in 2003 is the company in the Free State that manufactures labor-intensive gold jewelry. In the past, raw gold was shipped to Italy, made into jewelry and then shipped back to RSA for sale to South Africans and tourists. Today, the added value of transformation is beginning to stay in South Africa (see Chapter 12, Section 12.9, THE WAY FORWARD and Section 13.13, TRADE NOT AID). South Africa, because of its historical past (sanctions associated with Apartheid), has many similar industries from clothes to arms and automobiles being manufactured for local, regional and international consumption. The rest of Sub-Saharan Africa needs to take note.

It also means that the rest of Sub-Saharan Africa needs to develop industries to serve the region and which transform its raw products on the subcontinent and employ its people.

“Sub-Saharan Africa is the world’s most fragmented region. It is demarcated by 165 borders into 48 countries—22 with less than 5 million people, 11 with less than 1 million. Small size imposes real

constraints on development, and without economic cooperation and integration Africa will fall further behind the global frontier” (World Bank, 2000) (see Chapter 12, Section 12.3.4.1, Downsizing Governments).

Sub-Saharan Africa has one of the poorest records of regional trade as a means of improving the subcontinent’s economies; 5.3% of GDP compared to 26.5 for East Asia and the Pacific, 15.3% for Europe and Central Asia, 6.4 Latin America and Caribbean, 3.5 Middle East and North Africa and 0.8 South Asia (Commission for Africa, 2005).

A number of regional organizations are evolving in Sub-Saharan Africa that are developing free-trade as a means of developing regional markets. Kousari (2004) believes that enhancing south-south trade in particular, in non-traditional commodities, such as fruits, vegetables, fish and other seafood, and increasing exports to emerging markets are avenues for enhancing Africa’s trade diversification. The need to enhance intra-African trade is among the main objectives of NEPAD. The International Food Policy Research Institute (IFPRI) has identified more than 250 agricultural goods for which one or more Sub-Saharan African countries have a comparative advantage, 33% (1/3rd) of which are goods of which other African countries are importers. Given that 25% of Africa’s cereals are imported, increased intra-regional trade could encourage increased agricultural production and assist in partially alleviating Africa’s food security. Kenya has for the past decade imported grain from Uganda and Tanzania during periods of drought (Commission for Africa, 2005).

Leistner (2004) notes that most African national economies are individually small and weak, but if properly organized into regional groupings they have the potential to become economically viable as espoused by the UN Economic Commission for Africa (ECA) (see Chapter 12, Section 12.3.4, Structural Adjustment, U.S. Movement to Control Developing Economies and Section

12.3.4.1, Downsizing governments). According to the World Bank (2005), these regional economic communities have shown limited ability to benefit from

“regional approaches to build and maintain infrastructure in key trade logistic corridors, to create common institutional and legal frameworks in such areas as customs administration, competition policy, and the regulation of Common Property Resources (such as fisheries), and to develop solutions to trans-border problems in health”.

It would appear that there is much overlapping (Commission for Africa, 2005) and in some cases, especially in East and Southern Africa, a need to consider consolidation of these organizations and the treaties that created them.

If current inequalities in the global distribution of income continues, where the richest 1% of people in the world continue to receive as much income as the poorest 57% (Booker & Minter, 2001), efforts to stop the “illegal” flow of immigrants from the South (And East) to the North will fail. They will bring with them many of the problems of the developing world, including poverty, and increasing costs to the north to deal with health care, education, housing and crime. Terrorism will be hiding in the shadows of every suburban home in Europe and North America. The rich will live in fear within security compounds cordoned off with razor wire and supported by heavily armed rapid response security teams, prisoners of their wealth. The global society has a choice, either we all work to make the world a better place for mankind, or mankind and modern civilization will be dragged under by the mass of poverty that greatly outweighs the few with wealth.

13.19 CONCLUSION

Modern communication and transportation is accelerating the rate at which globalization is taking place. Globalization to date has not been kind to Sub-Saharan Africa. Linked to the last two chapters, foreign aid and structural adjustment have been used by Western governments to ease the access for their multi-/trans-national corporations to plunder Sub-Saharan Africa's raw products in order to drive their economies.

A 2007 report by Thomas Carothers of the Carnegie Endowment for International Peace, best sums up the current situation both globally and in Sub-Saharan Africa, especially with regard to U.S. policy that tends to impact upon the policy of other global players such as Europe and China. Under the George W. Bush and William (Bill) Jefferson Clinton administrations, the U.S. lost credibility as a symbol of democracy and human rights, sacrificing democracy in favor of economic and security interests, reminiscent of friendly relationships with autocratic governments during the Cold War as "bulwarks against Communism or lucrative trading partners". Based upon the ideology of the "war on terrorism", and "oil" for U.S. energy companies, the Bush Administration has strong ties to 50% of the 45 "non-free" countries in the world (e.g., Pakistan, Saudi Arabia, Egypt, Nigeria, Ethiopia, Rwanda, Mauritania, DRC, Chad and Angola). Hypocritically, it has a "get tough policy" with dictatorial regimes, such as Belarus, Burma, Cuba, and Zimbabwe where it has no significant interests in oil or anti-terrorism cooperation. Closely associated with the Bush style promotion of democracy is military support, intervention and regime change (Iraq, Afghanistan, DRC and Somalia). The United States as a stalwart of human rights has been tarnished by its hypocritical stance supporting human rights, but on the other hand for abuses of detainees and prisoners in Iraq, Afghanistan, and Guantánamo; secret CIA prisons; unauthorized domestic eavesdropping, and stripping away rights of

designated “enemy combatants” (Carothers, 2007) in the name of the war on terror. Unless the next U.S. administration changes these policies, it bodes ill for Sub-Saharan Africa, with the likelihood of continued support for undemocratic governments in the name of oil and anti-terrorism, and the use of AFRICOM to train proxy armies to undertake U.S. bidding in order to achieve these objectives regardless the cost to lives or freedom; the Cold War now being turned into both an economic war, and another ideological war that will not be won using force. Terrorism has been around since the beginning of humanity. It is how the weak have stood up to abuse by the powerful, and can only be overcome in developing win-win relationships with the rest of the world.

Since the end of the Cold War, where millions died over ideological wars – which could be argued were also resource wars - millions more people have died because of factional fighting between various groups over accessing Sub-Saharan Africa’s vast mineral wealth; in Angola, Congo Brazzaville, Liberia, Sierra Leone, Sudan and the Democratic Republic of Congo just to name a few of the countries. The conflict in the Democratic Republic of Congo was considered Africa’s first “World War”, as Uganda, Rwanda, Zimbabwe, Angola, Namibia, Chad, Libya, as well as the U.S. and France along with their multi-nationals were drawn into supporting various factions with the promise of booty futures.

Western countries and multi-nationals have fueled the fire, providing warring factions financially and technically, and with armaments. If controlled, the breakdown of governance, with various factions holding mineral rich territories, often facilitates the extraction of natural resources at maximum profit. This is good capitalism in the purest sense, since it is cheaper to pay off a puppet president and a few generals, or rebel leaders than an entire country. Profits destined for local factions and/or governments are often used to purchase arms to prolong the fighting. In addition to abundant mineral resources, foreign aid grants

and loans often allow governments to shirk their responsibilities to their citizens and use what little wealth is generated for building up armies that consolidate their power and ability to plunder the wealth of their country, instead of investing in a healthy educated society that can integrate into a global economy. This de-linking of the political elite from their constituency is also an incentive to “mine” renewable resources such as timber, wildlife and fish for short-term gains – money in the bank for the elite, and/or survival for the poor.

There is some concern that many of Sub-Saharan Africa’s leaders and the West may not want an educated populace that will demand accountability from their governments and access to control, management and the right to economically benefit from their resources, while allowing government to generate income from taxing them, as opposed to stealing all their wealth and maintaining them in a state of misery. In other words, there is concern that all of this talk about development and democracy is a façade of the elite and nothing will change. We, the global society, must hold Western and African governments and multi-nationals accountable for their actions until they prove to us that they are willing to do what is right for mankind and even then, they will need monitoring by some of the NGO watchdogs.

There are proposals on the table to change these relationships, to turn them into a win/win situation instead of win/lose relationships. AGOA, Everything but Arms (EBA), NEPAD and the new Millennium Challenge Account are proposals, among others, attempting to move in this direction, to begin helping Sub-Saharan Africa industrialize and transform its resources in Africa. Let us hope these are not “wolves in sheep’s clothing” which end up causing pollution, paying slave labor, mining Sub-Saharan Africa’s rich resources, and end up being more of the same old failed Washington Consensus structural adjustment policies that stimulate Western economies at the expense of African economies. It is

imperative for Sub-Saharan Africa's people and their natural systems that this transformation takes place. The 2002 launched "The Publish What You Pay" coalition of more than 190 Northern and Southern NGOs that is calling for legislation to require extractive companies to disclose their payments to all governments, can result in accountability and transparency if properly implemented.

Ultimately, unless Sub-Saharan Africa evolves beyond a subsistence economy and a majority educated middleclass is created, the Western export of free-market democracy, which often places an impoverished majority in control of "market dominant minorities", is a recipe for turmoil and destruction. Much of Sub-Saharan Africa is faced with this scenario, where politics becomes broken along ethnic and religious lines in declinining and/or stagnating per capita economies: the Lebanese economic elite in West Africa, the Indian elite in East Africa, the whites in Southern Africa, Tutsi elite in Rwanda and Burundi, the urban capitalist Kikuyu elite of the Kenyatta era and Kalenjin favored under Moi in Kenya.

It is just as important for the future of Western civilization. 911 should have been a wakeup call to the West that their way of life will have a difficult time surviving if it is on the backs of the rest of the World. Poverty does not create terrorists – that is a falsehood and a smear (Bay, 2002).

"However, theft of wealth and development denied inevitably seeds resentment, the spark terror's masters know how to stroke. Corruption and stolen opportunity stalk the streets and hard corners where terrorists recruit. Globalization if properly applied can be a means of relieving mass endemic poverty and a key to defeating terrorism" (Bay, 2002).

The status quo in how the West has dealt with Sub-Saharan Africa to date was not sustainable in the Deep South of the U.S., nor in Apartheid in South Africa and in

a global society it will not be sustainable for a few predatory countries to feed off the majority. It must be win/win for everyone.

A third reason why it will be important for the West to help Sub-Saharan Africa in its transition into an industrialized society is that this will help create a middleclass that has the luxury to develop a modern environmental conscience. If the majority of Africans remain poor and uneducated in trying to subsist, the risk is that in 50 years “Wild Africa” as we know it today (and it is already fleeting, along with its charismatic mega-fauna), may be no more. Thus, industrialization will not only take pressure off the rural resource base through urbanization, but will help spur the development of an African environmental movement, with African solutions that hopefully will not alienate, but integrate those who choose to retain rural lifestyles from economic benefits derived from the sustainable management of “their” natural resources. This cannot happen too quickly.

This means good governance and accountable governments, or as Collin Powell said, capital is a “coward” that shuns uncertainty and crime. It flees war and disease and it won’t go near corruption.

Chapter 14

14.0 SUGGESTED ROADMAP FOR THE WAY FORWARD

14.1 INTRODUCTION

Sub-Saharan Africa has among the highest population growth rates in the world, increasing on average 5.5-6.5 times in the 20th century and expected to increase up to another 2.8 times to about 1.8 billion people by 2050. Meanwhile, Sub-Saharan Africa's cattle population doubled from about 104 million in 1961 to 208 million by 2003, while the overstocking rate in 1986 in many places was already 50 to 100%. Only about 27% of Sub-Saharan Africa (\approx 600 million ha) is conducive to sustainable low-input agriculture and/or commercial high-input agriculture that can potentially feed the growing urban masses on the continent. About 70-75% of Sub-Saharan Africa (SSA) is comprised of savanna biome. Its best land use is as pasture for wildlife and livestock, but while marginal, is increasingly being used by itinerant farmers in search of new lands as fallow periods disappear across the subcontinent. Between 1961 and 1999 in Sub-Saharan Africa, land expansion accounted for 35% of increases in crop production. About 353 million people, 46% of Africa's population, are living on moderate to low potential agricultural lands. Most of this is in the savanna biome of Sub-Saharan Africa, resulting in severe environmental degradation and a zone of conflict from Senegal to Sudan along the Sahelian/Saharan borders. How did Sub-Saharan Africa end up in what appears to be an ever downward spiral, ecologically and economically, and how can the continent escape this death trap?

14.1.1 Co-Evolution of Africa with Wildlife

Sub-Saharan Africa is the “Cradle of Mankind” where 1.8-1.6 million years ago the progenitor of early man *Homo spp.* arose slowly, spreading across the world. The “out of Africa” theory, based on genetic DNA (Deoxyribonucleic Acid) coding analyses has it that evolutionary divergence took place in response to the expanding Sahara desert, which acted as a genetic isolating barrier. By around 100,000 years ago, several species of hominids populated the earth, including *Homo sapiens* in Africa, *Homo erectus* in Southeast Asia and China, and the Neanderthals (*Homo neanderthals*) in Europe. By around 30,000 years ago, the only surviving hominid species was *H. sapiens*. Researchers place the timing of human’s (*Homo sapiens*) one time movement out of Africa as between 80,000 and 45,000 years ago from Africa across the Red Sea into modern day Yemen, differentiating into the various races at a later date. They took a southern coastal route through South Asia (modern Pakistan/Arabian Gulf) with entry into Europe from South Asia about 50,000-35,000 years ago. An earlier attempt via a northern route out of Africa into the Levant (Israel and the Near East) failed as the earth entered into a period of glaciation causing North Africa and the Levant to enter into a period of extreme desertification.

Africa is the only continent where man co-evolved with wildlife. In the rest of the world, there were major extinctions of mega-fauna during the Pleistocene, coinciding with the arrival of man:

- The first wave of extinction, with man moving out of Africa on foot from 100,000 – 30,000 years ago.

- The second wave of extinction out of Asia into North and South America by foot and the Pacific, Australasia and Madagascar by raft from 30,000 to 1,000 years ago.

In recent times there has been a third wave of extinction out of Europe on sailing ships about 1500 – 1840 A.D. and again by rail, steamship, motorcar and plane from 1840 – 2000 A.D. (today), resulting in the wholesale removal and/or modification of habitat, continuing today and compounded by the global population explosion, and in the case of Africa linked to poverty, subsistence lifestyles and centralization of land/resource tenure.

14.1.2 Man the Hunter

Man's evolution into the hunter or "super predator" is believed to have had much to do with the development of who we are, setting man apart from all other animals. Man is the only primate who became dependent on meat for survival. Hunting impacted man psychologically, socially and territorially. This included speech, the development of weapons to overcome human frailty necessitating bipedal movements, speech and facial expressions needed for cooperative hunting, organization into hunting bands, territoriality and sexual division of labor to allow for the prolonged childhood linked to extended development of the brain and increased intelligence, pair bonding and eventual development of modern societies. It is not until about 5-10,000 years ago that man began entering into agriculture as an alternative to hunting and even then, hunting has always been a supplement to that which is grown on the land and/or taken from domesticated livestock. Hunting, both as a means of survival and as an urge that must be fulfilled, is still a strong part of man and his character as we enter into the 21st century A.D.

14.1.3 Pre-Colonial Civilizations

Prior to the coming of the European settlers to Africa, rich and varied cultures existed, from Ancient Mali and Songhay, where cities such as Djenne and Timbuktu had Islamic universities by the 16th century, to the Bakongo kingdom where ambassadors were sent to both Spain and the Vatican and a Papal Nuncio resided in Mbanza in the 15th century A.D.

Substantial, but controversial evidence exists that early civilization as known to mankind began in what is now lower Egypt/Ethiopia/Sudan, making major contributions to the arts, religions, agriculture, social organization, medicine, writing and architecture that gradually spread to Europe and Asia. This civilization was black in origin, gradually interbreeding with other races, especially whites as the region was invaded by outsiders. West and Central African ethnicities such as the Wolof, Serer, Fulani/Peul, Toucouleur, Serer, Fang, Yoruba and Bamum, are believed to have originated from the Nile Basin based on morphological, biochemical (e.g., melanin), linguistic, cultural (e.g., matriarchal societies, kings, circumcision), historical (e.g., Greek and European historians, logs of early European navigators/explorers, Arab and Egyptian translations, Biblical and Koranic writings), archeological, architectural, artistic and religious (e.g., similar gods, totems, ancestor worship) information and ties. The ancient empires of Ghana, Mali, Gao, Yatenga/Mossi and the kingdoms of Djolof and Cayor (both in Senegal) can also be traced back to having Egypto-Nubian roots.

By about 4,000 BC, gradual desiccation of the Sahara pushed people south and west into wetter regions. At about the same time (3,000-4,000 BC), domestic cattle also spread south of the Sahara and supplemented subsistence hunting and

fishing. By 2,000 BC, agriculture appeared in the Sahel, occurring conjointly with the drying of the Sahara area, forest retraction and a human ebb towards a more favorable zone. Sedentary agriculture developed through the domestication of both African cultivars (e.g., sorghum, bulrush millet, finger millet, African rice, and ignames) and introduced food varieties (bananas, coconuts, the root crop taro from South Asia and corn and manioc from the New World). The change from gathering to food production allowed human populations to significantly increase and to shift from a nomadic to a settled life. Food surpluses allowed the development of non-food producing specialties from war-making and statecraft to art. Sedentarization intensified during the first millennium (1,000 BC) through the combined action of collectors, fishermen, cattle raisers, cultivators of long-fallow fields and blacksmiths.

By about 3,000-1,000 BC, continued drought and desertification began forcing people to search for a more amicable climate, resulting in a southward agricultural movement. The focal point of this migration was from the central Benoué River Valley of Cameroon and Nigeria. They did not move across East and Southern Africa in large numbers, but in small lineage groups. Their economy was based on “shifting cultivation”, also called slash and burn or itinerant agriculture. As population pressures built up and nutrients were leached out of the soils, they may have been forced to move in search of new land.

The iron-using Bantu used wooded environments unavailable to the pastoralists because of sleeping sickness carried by the tsetse fly and in an almost symbiotic relationship, created grasslands through fire and bush clearance, which in many cases were gradually taken over by pastoralists. This interface between pastoralists and agriculturalists meant acceptance of economic activities across cultural boundaries. It is believed that the most likely movement of livestock along with iron-using agro-pastoralists from East to Southern Africa took place in

the inter-lacustrine area of East Africa and the movement of agropastoral people down through the tsetse-free corridors of the Tanzanian Highlands and Malawi to Zimbabwe and the Transvaal of South Africa.

Gradually the Bantu language dominated East and Southern Africa. It is believed this is because they were technologically superior compared to pastoralists, Pygmies and Khoisan hunters and gatherers. “Bantuization equaled urbanization” where they lived in compact settlements which these other groups visited for trading purposes, many of whom were absorbed through marriage and/or began to speak the Bantu languages.

The deserts of the Karoo and Namib did not allow traditional agriculture, eventually becoming a safe haven for the Bushmen who were pushed aside by the Bantu migrations, while Pygmies escaped into the then impenetrable tropical lowland forests of Central Africa.

The most advanced southern movement of Bantu coming out of Central Africa were the Xhosa who were forced to stop at the Fish River (between 1702 and the mid-1700s), having only summer-rainfall crops (e.g., sorghum, millet and yams from Central/West Africa and bananas from Asia, etc.). The Afrikaner, descendants of the 17th century Dutch/Huguenot immigrants (arriving in Capetown in 1652), brought with them Mediterranean winter-rainfall crops such as wheat and barley, adapted to the temperate climate of the Cape of Good Hope where they initially settled. By the 19th century, the southern migrating Bantu Nguni-speaking Zulu headed by Shaka, would clash with the northern migrating land-hungry Afrikaner trekboers. Shaka’s militaristic approach to absorbing other groups would eventually be felt as far away as southern Tanzania where Nguni groups settled, some believe linked to a movement out of Southern Africa caused by a population explosion.

14.1.4 Traditional Governance and Management Systems

In pre-colonial Sub-Saharan Africa, human and livestock populations were low and wildlife populations were high. There was less need to intensively manage wildlife as there is in the 21st century.

Small-scale rural societies practiced both governance and natural resource management at a very localized level. Traditional African society was highly democratic. Very often chiefs would be deposed or killed if too autocratic or if they failed to meet the expectations of their people. Zulu kings could not make laws without the consent of their councilors (*indunas*). Similarly, in many Bantu cultures, the local chief could not make key decisions without agreement of elders/headmen. Western style winner-take-all voting, in which the majority could impose itself on a minority, was a foreign concept to Sub-Saharan Africa.

Natural resources were managed as “common property” resources for the good of the greater community. Chiefs, elders and hunting guilds carefully controlled access to natural resources, including agricultural land, pasture, wildlife, tree products, fish, wild medicines and honey. Taboos determined protected species not to be hunted, and thus others that could be hunted. The ancestors and spirit world were consulted through chiefs, spirit mediums and master hunters to assure a safe and successful hunt or harvest. Ultimately, by means of culture, taboos based on religion and traditional value systems, local rules and regulations enshrined in farming practices, land tenure systems and folklore, indigenous Africans protected and conserved ecosystems and their associated biodiversity. Territory and mobility were also key components to these management systems.

Wildlife and other resources were high relative to the human population, negating the need for the intensive management that is necessary to assure sustainability in

the 21st century. While the majority of wildlife was harvested for meat, game also served a multitude of purposes, including sport and commercial uses. Human populations were low relative to the game and the weapons were relatively primitive (e.g., poisoned bows and arrows, crossbows/*arbaletes*, game pits, dead falls and much later, blackpowder muskets) so that the above traditional controls, with few exceptions, were more than adequate to assure sustainability.

Rules and regulations regarding access to natural resources were precise and codified, although not written down, and had been enforced since time immemorial. The result was sustainable exploitation of natural resources. This had been accomplished with no ecological purpose in mind, as we understand it, but out of sheer instinct for self-preservation. Conservation of game animals and fish was necessary in order to provide for future survival. The norms and morals of hunting helped reinforce the norms and morals of these rural small-scale societies.

14.1.5 The coming of the European to Sub-Saharan Africa

The harshness of the European climate that encouraged conquest, accumulation (materialism) and continued technical progress as survival mechanisms, eventually gave Europe superiority over Africa, while the search for riches (e.g., gold and ivory) as a means of accumulation and the need for slaves to fuel the economies of the New World provided it with justification for colonization.

One of the worst tragedies in modern history was the supplying of slaves to the plantations of the New World. It is estimated that approximately 50 million Africans were torn from their motherland and taken to the New World, the majority dying along the way (10-11 million surviving), as unwilling instruments in laying the foundations for Western capitalism. In fact, Europeans often acted as

junior partners to African rulers, merchants and middlemen in the slave trade. Unequal exchange became characteristic of international commerce, with Sub-Saharan Africa always at a disadvantage. African wealth, from human beings to crops and precious minerals, was exchanged for worthless articles like trinkets, mirrors and beads. Raw materials were transformed overseas and sold back to Sub-Saharan Africa for profit.

The establishment of ecology as a formal science occurred around 1866. Ecological Imperialism suggests superhuman achievements of European expansion into the colonies, which brought with it the imposition of values and management systems based on the Linnaean classification of plants and animals and the concept of reserves and parks (i.e., preservation), which separated man from nature. Indigenous management systems and knowledge were ignored.

Imperial settlers were hardly aware of the manipulation of nature by indigenous peoples. They assumed that the landscape they encountered for the first time was untouched “virgin” territory, “almost fresh from the Maker’s hands”. From the first day of their encounter, Europeans affirmed the principle of their superiority over the black race. They forced Africans into servitude and slavery, justified on the basis of superior strength. To open markets for their trade in Sub-Saharan Africa, they stamped out the last vestiges of African civilization – traditional trade, production and management systems. European visions of landscape, nature, technologies and culture were imposed on Africa as though it had no past, with the only future being one of Western civilization. North, Central and South American civilizations would suffer similar consequences with the coming of the Spanish *conquistadores*, and eventually French and English traders, fur trappers and settlers.

The landscapes of Sub-Saharan Africa were recreated to fit the geometric and orderly mindset of the European, from rectangular fenced farms, “Sherwood forests” in the forms of parks and game reserves to governmental structures that either co-opted or obliterated traditional means of governance, whichever suited the conqueror. European individualism and materialism was imposed on communal societies where resources and land were borrowed from the ancestors and survival and improvement of the group was more important than that of the individual. This set the stage for a conflict of cultures and ideologies that are still playing themselves out at the beginning of the 21st century.

The gun and the Bible served as the basis for European conquest in Sub-Saharan Africa. Wildlife served as a tool of that conquest; initially ivory, skin and meat fueling colonial economies. In many cases, Europeans and co-opted Africans hunted side by side in this plunder. Wildlife was greatly reduced and in a number of instances, shot to extinction and pushed out by European livestock and the creation of European landscapes. A similar history played itself out in the conquest by Europeans of North America and the “Red” Indian:

- Bluebuck of South Africa was extinct by 1800;
- Quagga was extinct by about 1870;
- In the 1700s, there were 500,000,000 springbok between the Karoo and the Kalahari Desert that migrated in herds of up to 10,000,000 animals. The great migrations were nearly finished by 1896; victims of guns, clubs and the cows/sheep that devoured their pasture;
- Elephant populations were reduced in South Africa (RSA) to 12 by the 1920s, to <4,000 by 1900 in Zimbabwe and 300 in Namibia by 1900. When the European first made contact with Sub-Saharan Africa about 300 tons/year of ivory was exported, rising to 500 tons/year by 1800 and 1,000 tons/year under white rule by 1914;

- White Rhino (RSA) reduced to 20 by 1895 in South Africa;
- Cape Mountain Zebra reduced to 400 by 1922 in South Africa;
- Bontebok reduced to 120 in 1927 in South Africa;
- Black Wildebeest reduced to 550 by 1890 in South Africa;
- Between 1937 and 1939, 200,000 elephants were killed in the Belgian Congo (today's the Democratic Republic of Congo) for ivory;
- As late as 1953, 750,000 skins, chiefly duiker, were exported out of the French Union in Africa with an average of 2 million duikers killed annually for their hides in Francophone Africa south of the Sahara;
- In Tanzania from 1903-1911, a total of 256 tons of ivory was exported, representing approximately 1,200 to 1,500 elephants killed/year in addition to an unaccounted amount smuggled in order to avoid the 15% export taxes; and
- During this same period, 53 tons of rhino horns were exported from Tanzania, representing 2,000 to 2,300 rhinos shot/year.

Once the conquest was over and Sub-Saharan Africa and its people subdued, the culture of hunting in Europe was turned into part of the culture of European Imperialism. The Colonial Masters of England, France, Belgium, Portugal and Spain in 1900 signed the first international conservation treaty, "The Convention for the Preservation of Animals, Birds and Fish in Africa". The goal of this treaty was to save African wildlife for hunting by royalty and upper class Europeans, as well as to place control of the ivory trade in the hands of the Europeans. Traditional hunting was for the most part outlawed, turning rural Africans into poachers. Conservation in Sub-Saharan Africa became a bastard product of a union between one thousand years of Anglo-Norman game keeping and 19th century economic imperialism. Initially, the economic incentive to preserve game was directly tied to a desire to secure monopolies over ivory trading. The outward form of the laws was English (European) history repeated. Instead of a

Royal House and aristocracy enforcing their will on lowly Britons (Europeans), African laws regulated the sport of imperial gentlemen at the expense of the indigenous people. The “Sherwood Forests” of England became the parks and hunting blocks of Africa. Traditional hunters/resource users became poachers, the “Robin Hoods” of Sub-Saharan Africa.

Some of the oldest game reserves in Africa are Groenkloof of 1822 and Knysna of 1856 in the Cape Colony, the Transvaal (now part of KwaZulu-Natal) Pongola Game Reserve of 1894 and the Tsitsikamma forests in 1886 in the Cape. In 1933, an International Conference for the Protection of Flora and Fauna of Africa held in London, laid down the principles on which national parks were to be established, which were based on a preservationist natural regulation philosophy. The oldest African park, Albert National Park, was established in Belgian Congo (today's the Democratic Republic of Congo) in 1925 to protect the mountain gorilla. The Sabi Game Reserve established in 1898 was rechristened Kruger National Park in 1926, the first national park in Anglophone Africa. The creation of game reserves, national parks, native reserves and European plantations created the tripartite division of land use separating whites, blacks and game. This is most evident today in South Africa, where wildlife is fenced in on game reserves, parks and game ranches almost exclusively for whites, while blacks are still, for the most part, economically fenced out. Africans, who had co-evolved with the mega-fauna and were an integral part of the subcontinent's ecosystems suddenly found themselves excluded:

- Africans have helped maintain savannas through fire, harvesting of wood for firewood and charcoal, itinerant agriculture and grazing of their livestock;
- Dense tropical lowland and afromontane forest biodiversity is increased by activities such as pit-sawing, itinerant agriculture and honey collection;

In recent times, resource managers realize that this exclusion is having major ramifications. This includes bush encroachment such as the loss of habitat for roan and sable antelope in northern Kruger National Park, South Africa, as forests close in and the loss of periodic openings from pit-sawing to provide the vegetation fed on by gorillas, having become critical with the disappearance of the forest elephant in Bwindi National Park, Uganda.

Ultimately, the introduction of modern-day medicine and veterinary care without concurrent education resulted in a human and livestock population explosion in the 20th century. In Sub-Saharan Africa, human populations increased from about 96-114 million to 622 million people between the years 1900 and 2000. Livestock populations (e.g., cattle, sheep, goats, horses, asses, mules, pigs and camels) increased from about 276 million in 1961 to over 622 million by 2000. This was exacerbated by a failure to modernize, necessitating large families as inexpensive labor under subsistence economies and as retirement insurance in old age. At the same time, introduced diseases such as rinderpest decimated wildlife.

Very often, political and civil rights were accorded to an elite group of Westernized Africans. The creation by colonial powers of this “tiny administrative African elite” and their secluded privileged existence isolated from the mass of poverty stricken peasants was a form of “Apartheid”. This brought along with it disenfranchisement of rural Africans from their natural resources, as the crown and then nationalization by the state at independence took over ownership of rural Sub-Saharan Africa’s wildlife, timber, soils, minerals, etc. and associated economic benefits, often reinforcing and strengthening what had begun under colonialism. It took “Common Property Resources” that were sustainably managed for hundreds of years and turned them into “Open Access Resources” centrally controlled by the state, belonging to everyone, but the responsibility of no one but the *petite bourgeoisie* who lacked the political will and the means to

sustainably manage Sub-Saharan Africa's natural resources without the support of alienated rural communities. Conservation equated to policing against rural resource users. This forced Africans into a perpetual state of poverty, keeping them backward and in a subsistence mode of existence.

To place what happened in perspective that a modern reader can understand, consider the following scenario. If tomorrow, the government took ownership over your home and property, but allowed you to continue living there, would you reinvest in the maintenance, let alone the improvement of your home? The answer would be no. What would you do if tomorrow the same government contended that your business resources therein also belong to them and any income from sales will go to the government, but the government will graciously provide you with some income to survive? Thus, your resources become public commodities over which you have little or no control, "Open Access", belonging to everyone, but the responsibility of no one but the bureaucracy. As soon as the government bureaucrat left, you would gather up as many resources in your business and on your property as feasible and black market them, even at undervalued prices, and keep what you could get for yourself and family without declaring the sales to the government. Does rhino horn, ivory, lion/leopard skins or the bushmeat trade ring a bell? Should we expect anything else? No, as we would do the same if placed in their shoes. Thus, this is what colonialism and centralization of land/resources at independence did to Africa's people and their relationship to resources that they had sustainably managed for thousands of years. The population explosion of the 20th century only exacerbated the problem, but was not at the root cause of the problem; land and resource tenure was.

14.1.6 Nation Building

Colonial policy tended to be that “nation building” was something beyond the capacity of Africans themselves. Historical African political communities were dispossessed by the European colonial powers as being uncivilized, unfit and incapable of self-government; a continent, which prior to the arrival of the European, was without a history of state and society. Africa’s rich pre-colonial history of well-ordered societies and complex inter-communal relations was ignored in favor of a European model.

The 50 or so states of the colonial partition were governed as though their people possessed no history of their own and became nation-states formed and governed by a political elite on the European model, mainly of Britain and France. Thus the development of “The White Man’s Burden” equipping arbitrarily constructed societies with European-style, political, social and national institutions.

The rural masses, who were often isolated from and segregated by this system, were herded like cattle and compressed into homelands unable to ecologically or economically sustain them in order to make way for colonial settlers or parks and protected areas. They were forced into “slave labor” for plantations and mines and/or to produce cash crops for the colonies. Thus, two different worlds were emerging, a dichotomy of an urban elite linked to Europe, and the rest of Sub-Saharan Africa.

14.1.7 Independence

At independence, Sub-Saharan African nationalist leaders and intellectuals, because of colonization of the African political consciousness, adopted the concept of the nation-state based on the European model. No alternative was

thinkable. The Western-educated elite played a major role in anti-colonial nationalist movements, having been educated and assimilated into colonial civil society producing a stratum of African society conversant in the language and political discourse of the colonial state and the Western philosophy of the political community. Anti-colonial movements and African intellectuals can be considered the means by which European political-cultural hegemony was maintained long after decolonization through alienation by these intellectuals of Sub-Saharan Africa's own rich history of pre-colonial political culture.

Thus, the basis of the post colonial state in Sub-Saharan Africa was the colonial state, independence constituting anything but a total break with colonial political values. Left behind at the end of colonialism was an unwieldy administrative structure relying on backward economies that could not support this bureaucratic weight, as well as a trade structure that benefited industrial countries, but blocked Sub-Saharan African growth.

Prior to 1945, less than 1% of Sub-Saharan Africa's population had full political and civil rights. Education was available to less than 5% of the population. In the late 1950s, just as independence began, Sub-Saharan Africa with a population of 200 million had only 8,000 secondary school graduates. Sub-Saharan African countries were expected to make a smooth transition from colonialism to independence, running sophisticated Western governments and economies with a "thin shell of educated" people. In many cases, the peasants had been trained to obey rather than think and understand the purpose of their work, resulting in a major constraint to continued development in the post-independent period. Even as late as the 1990s, many Sub-Saharan Africa universities emphasized memorization and feedback over conceptualization – remnants of the colonial past.

Sub-Saharan Africa's modernization has so far alienated Africa from itself in implementing the "imperial model" or "foreign model" which asserts that nothing in Africa's (past) experience is valid for the future. Statism became central to the new model of collective identify. Liberation produced its own denial and led to continued alienation of the masses, reflected in neo-colonial conservation policies today which continue to separate the masses in rural Sub-Saharan Africa from their natural resources and associated wealth based on a Western model, the only difference being that the state has replaced the colonial power: 1) Predatory elite rule and 2) Statism lays at the heart of Africa's ongoing crisis. The state as the only resolution of community remains central to African political thought, effectively de-legitimizing the non-state versions of community, thus trapping Sub-Saharan Africa in the political culture of the empire.

New nations were artificial creations bearing little relation to traditional political entities, the idea of a nation state being a foreign concept to Sub-Saharan Africa, an unnatural union. Ethnic groups, often traditional enemies, were suddenly expected to feel and behave as a nation. The new states suffered a serious defect, lacking loyalty of a unified people. Loyalty abided with the ethnic group. National consciousness of the European state was replaced by ethnic bigotry, clientelism, nepotism and institutional corruption.

Independent Sub-Saharan Africa inherited autocratic rule and structures from colonial administrations, assuming power in the absence of firmly rooted democratic institutions and processes. Multi-party one man, one vote elections tended towards one-party systems preferred by the ruling elite. One-party systems were closer to African tradition and brought more stability than multi-parties that resulted in ethnic divisions. Autocratic rule by one man or a small *clique* was a travesty of traditional Sub-Saharan African political decision-making, but was erroneously accepted by the West as being part of the African tradition.

Once the opposition is eliminated (e.g., chased out, killed or muted as under Sekou Touré of Guinea-Conakry, Hastings Banda of Malawi, Moi of Kenya and Mugabe of Zimbabwe), human rights are abandoned, while freedom of speech and the press become controlled by the autocratic ruler.

In the stagnating or shrinking economies of Sub-Saharan Africa, the communalization of politics resulted in each ethnic group struggling to place its *protégés* in power in order to guarantee themselves a portion of the national cake. Once patronage becomes a major instrument of politics, it permeates and subverts public life where merit plays no role, but ethnic and clan affiliations do. “Chiefs”, who in the past were the guardians of the people – including their self-respect and traditions - have become the “Big Men”, the “President’s for Life” who exploit their people. The fundamental prerequisite for development of a modern “Western” state often appears culturally incompatible with Africa. This is because neo-patrimonial clientelism exists in which wealth redistributed to the “Big Man’s” communal support base (his extended family, village, ethnic group, religious group, region, etc.) helps nourish the clientele who keep the “Big Man” in power. Often to maintain their power base, “Big Men” co-opt the armed forces into the elite.

Corruption associated with this patronage system, strongly linked to the extended family and tribe, and permeating all levels of society, may be the biggest cultural constraint to Sub-Saharan Africa adopting Western approaches to governance, business and even conservation. This poses a profound cultural crisis for Sub-Saharan Africa, resulting in Africans in their daily lives having to contend with two fundamentally different cultures; one rooted in traditional African communalism, forcing successful family members to share and distribute their wealth among kin to the point that many do not have a bank account or savings.

The second is rooted in Western individualism and the accumulation of materialism that evolved into modern capitalism.

14.1.8 “African Democracy” or “Donor Democracy”

Corrupt elites were easily turned into willing tools of harmful outside interests. The political elite, in order to maintain their lifestyles after independence, continued to serve the interests of the overseas powers (e.g., supplying raw products for the Mother country). They thus used the state to control the means of production without ownership. This allowed them to exploit others without appearing to be capitalists; a “Shadow State” of unofficial and illicit ties that bind the interests of state officials, rulers and rival strong men with foreign commerce and investors - “economic hijackers” delivering their countries into a new form of colonial bondage, where the mass of people live in poverty. In many cases, “democracy in Sub-Saharan Africa” has been a façade for the establishment of Western controlled puppet governments as former allies of the Cold War, especially France and the United States, battle each other for control of the continent’s vast natural resources. As a result, the West has developed economically, while the developing world, and especially Sub-Saharan Africa, continues to spiral out of control down a slippery slope to anarchy and poverty.

In the case of conservation and wildlife at independence, African governments retained most colonial wildlife laws and institutional set-ups, continuing the usurpation that had begun under colonialism. This ensured the continued exploitation by the hunting industry for the benefit and interests of the international trophy market, with the government being the conduit pipe. The inheritance of colonial laws and policies meant the inheritance of hostility between the government and local community members. Rural communities continued to be denied access to resources in colonially created national parks and

game reserves/hunting blocks from which they had been forced to re-locate, sometimes by compulsion, leaving their ancestral lands and abandoning their age-old hunter-gatherer practices. In adopting the colonial hunting laws and policies, newly independent governments retained policies based on alienating and marginalizing local community members from the hunting industry. Communities living in the vicinity of safari hunting areas continued resentment of efforts to develop the hunting industry. After independence, most local people's interests were still not considered paramount by African game and park departments. They saw no benefits from safari hunting or ecotourism as a conduit for generating revenue to improve their (local peoples') living standards.

By the 1990s, Heads of State in Sub-Saharan Africa had a 60% chance of losing power through assassination, exile or imprisonment, as various elites fought for control of the subcontinent's vast resource wealth. By the early 1990s, more than half the Sub-Saharan African states underwent transitions from military or one-party regimes to civilian rule. Much of this was a formality that allowed political parties with little change under the surface. By the mid-1990s, military coups *d'etats* in Rwanda, Burundi, the Central African Republic, Congo Brazzaville, the Gambia, Niger, Sierra Leone and more recently, the Democratic Republic of Congo, reversed these trends. Where multi-partyism exists, there tends to be a dominant party and thus little balance of power or accountability. In 1999 in Sub-Saharan Africa, one in five (20%) people lived in a country racked by civil or cross-border wars. By 2000, military leaders had replaced civilian governments in more than half the African states, often under the guise of democracy. Leaders have become adept at accommodating the international norm for competitive elections, while learning to manipulate them to their own ends. By 2004 every Sub-Saharan African nation has held elections, except for the Democratic Republic of Congo (DRC/former Zaire), though the degree of fairness of polls across the continent has varied widely. Changing constitutions to run for third

presidential terms appears to be a trend as seen in the Central African Republic, Nigeria (blocked by Senate) and Uganda in 2006.

Parliamentary democracy can work when individuals identify as citizens as opposed to communal support networks such as ethnic and/or religious groups necessary for survival under precarious economic and environmental conditions. Meanwhile, the majority of national budgets of most Sub-Saharan African countries are donor funded. This “Donor Democracy” has two main features:

- Empowerment of the state through creation of an oligarchy (elite); and
- Disempowerment of the citizens.

Since the state does not need to collect taxes from its citizens, living off donor handouts and natural resources, citizens have no real way of holding their government accountable, while the oligarchy’s allegiance and accountability is to fulfill the desires of its donors and expatriate private sector partners as opposed to doing what is best for its citizens. As long as the oligarchy bows to the West (e.g., adopts structural adjustment programs that allow extraction of cheap raw products from the continent), welfare keeps coming in, a portion of which is skimmed by the bureaucratic elite to help them maintain their lifestyles – corruption being ignored by the donors, while the majority of the people suffer in silence. The vast majority of the continent’s riches are expropriated by the West in collusion with the oligarchy. Little or nothing from Sub-Saharan Africa’s riches is reinvested in the people (health and education) or infrastructure (industry, road networks). The German-based Transparency International rates Sub-Saharan African countries among the most corrupt in the world. Meanwhile, for every dollar of AID to Sub-Saharan Africa, Western economic interests take out a minimum of two dollars.

Where democracy exists, it tends to be an illusion. Human rights violations, official corruption and a lack of government accountability are commonplace. “Aid-speak” is full of many plastic words such as “good governance”, “human rights”, “anti-poverty”, “deregulation”, “de-bureaucratization”, “decentralization”, “multi-party democracy”, “civil society” and “anti-corruption”. In many cases, these processes are absent and democracy becomes a façade.

Preliminary attempts by Africans at rectifying these problems, such as in Zaire (the Democratic Republic of Congo) in the early 1960s, did not fit the Cold War agenda of the West. Uganda, under President Yoweri Museveni, appears to be one of the first African countries trying to find an “African Solution” to democracy that fits within their socio-cultural make-up. However, after more than 20 years in power, concern exists that President Museveni is beginning to show signs of the classic “Big Man”, censuring opposition and using repression, while staying in power and arranging with parliament to change the constitution, allowing him to run for more than two terms. Ultimately, democracy must come from within and will likely never work if imposed from the outside based on pre-packaged one-model-fits-all solutions (e.g., one-man one-vote multi-party elections). The same can be said for Community-Based Natural Resource Management (CBNRM) and conservation in Sub-Saharan Africa.

14.1.9 Beginning of 21st Century, Overpopulation, Desertification and Declining Per Capita Land to Feed Sub-Saharan Africa

Sub-Saharan Africa is said to be suffering from over-population and desertification. This is not a new phenomenon, having been associated in the past with the spread of the Bantu culture throughout East and Southern Africa. Africa has dealt with this in the past and will have to deal with it in the 21st century. Today's movement, rather from north to south, is from rural to urban, very often from the interior towards the coasts, from low economic zones to the subcontinent's limited areas of economic growth (e.g., South Africa). As currently being practiced, welfare relations and food handouts from the West are not believed to be a sustainable solution to economic growth and development in the wealthiest resource gifted subcontinent in the world.

Agricultural land per capita has decreased from 0.5 to 0.3 ha over the last 30 years, while 60-70% of the labor force ekes out an existence as itinerant farmers and/or nomadic pastoralists whose ways of life are disappearing. Low-input agriculture, particularly in the absence of appropriate conservation practices (e.g., fallowing), leads to degradation of the land, further constrained by the geometric increase in domestic animal populations. This man-made desertification creates tension zones, especially across the Sahel, as land and resources are degraded and their availability becomes limited, examples being:

- 1989 Senegal and Mauritania nearly went to war as pastoralists and farmers collided – 70,000 farmers fled Mauritania, linked to dams and proposed irrigation of traditional floodplains;
- Darfur, Sudan and Nigerian pastoralists and itinerant farmers collide;
- The Ivory Coast – land disputes between indigenous Ivorians - Burkinabé and recent immigrants from Sahel, leading to civil war;
- Rwanda – complex geo-political war, but land and resource scarcity helped spark the fire as the population increased from 2.1 to 7.7 million between 1950 and 2000, resulting in 843 inhabitants/km² of arable land;

- In October 1993, about 30,000 Kikuyu farmers were chased out of a traditional pastoral area by Maasai herders, Enosupukia (between Nairobi and Narok); and
- Kenya, August 2004 land invasions of mostly white-owned ranches linked to population increase from 6.3 – 30.7 million people between 1950 and 2000.
- Kenya, 650-1,000 deaths between the new year and late-January 2008, and 250,000 internally displaced people, proximately over disputed presidential elections, but ultimately conflict over land and resource scarcity, linked to ethnic clashes over power and thus privileged access to land, jobs and other resources.

As this form of agriculture that has not changed for the past 2000 years results in soil exhaustion and crop failure, often the only thing left is to send children to work for someone else. Studies have shown that cultures dependent on subsistence farming have the highest rates of child labor. In most cases, these victims of this “poverty trap” are denied a formal education – condemned to an endless cycle of poverty passed on from one generation to the next.

14.1.10 “Islands of Wildlife” Surrounded by a Sea of Poverty

“Islands of Wildlife” are disappearing under a wave of poverty as their habitat is engulfed and degraded by small farmers, pastoralists and, in East Africa, increasingly commercial farms on high altitude grasslands. There is a direct relationship between the increase of human populations and decrease in large herbivores and their habitat on the subcontinent. In countries such as Kenya and Tanzania, wildlife populations are estimated to be 25% of what they were 40-50 years ago, as habitat has gone beneath the plow. In other countries, such as Uganda and much of West Africa, the percentages of surviving wildlife may be even lower. Today, in Southern Africa as a whole, wildlife makes up only 10% of the large herbivore biomass, the remainder consisting of livestock. In Kenya, and this is believed to be the major problem with wildlife throughout the subcontinent, there appears to be a direct relationship between the increase in human

populations (+>3%/year) and the decrease in wildlife (large herbivores) (->3%/year), apparently from habitat loss.

Cotton fields and livestock are invading the hunting blocks and national parks of the Benoué, Faro, Bouba-Njida in Cameroon. Maasai cattle graze in Amboseli and Maasai Mara National Parks, Kenya, while their rainy season dispersal areas – where wildlife spend up to six months of the year, during which time young are dropped and weaned – are being converted to commercial wheat and small maize farms. Along with conversion of land to small farms, by 2001 there were 10x more cattle than the next most abundant wildlife, zebra, in the Tarangire National Park rainy season dispersal area. Lake Nakuru National Park, Kenya, is so hard edged – surrounded by small farmers – that the fences are bent inward from locals slipping across illegally to access resources which they need to survive, such as firewood. These are only examples, but the reader can be assured that this is occurring across the subcontinent, along with poaching for short-term gains, even in highly developed South Africa. Modern conservation and development, as they currently stand, have forced Africans to take a short-term view of wildlife that they sustainably managed and cohabited with for hundreds of years.

Only on private and some communal lands in Southern Africa, where it has become a major economic resource, have wildlife populations exploded since the turn of the century after having been decimated by European settlers.

The body that attempts to save endangered species through regulated trade, the Convention on International Trade in Endangered Species (CITES), ignores many of the real current causes of elephant/wildlife depletion, which cannot be addressed through trade control, but must be dealt with on-the-ground and are integrally linked: 1) Poverty, 2) Failed Centralized Management Systems, 3) Inappropriate Governance, 4) Corruption at all levels of society, 5) Lack of

perceived control by rural communities over access to “their” wildlife and other resources, 6) Alienation by rural communities towards parks and protected areas, which they perceive as having been confiscated from their ancestors and which cut them off from natural resources needed for survival and economic development, 7) Lack of adequate benefits (economic and cultural) to rural communities from elephant and other wildlife, 8) Human and livestock populations that have increased up to 6.5 times during the 20th century, displacing wildlife and leading to, 9) Land hunger and resulting habitat loss, 10) Failure to urbanize and industrialize at a rate that can take significant pressure off rural areas and their natural resources by offering alternative lifestyles and 11) The illegal bushmeat trade, which could be sustainably managed if legalized, to fill the demand of rapidly growing urban populations in Sub-Saharan Africa.

Most rural Africans who bear the consequences of living with wildlife have never heard of CITES, it being irrelevant to their daily lives. In fact, CITES helps create black markets, providing minimal returns to rural Africans and, if anything, encourages mining wildlife to increase revenue for short-term gains and/or conversion of critical habitat to man-made agricultural systems, since wildlife as a land use has little long-term value. CITES has become a three-ringed circus at the expense of rural Africans and their wildlife, that serves as an ideological battle ground (e.g., animal rights versus sustainable use, non-hunters versus hunters – mostly urbanites whose lives do not depend on living directly from nature, buying their food in a supermarket) where Western dogma and ideologies are debated as various factions through nation states vie for political control of “global conservation direction”.

CITES members in the West and their animal rights allies are also known to sponsor range and non-range states to meetings in return for their votes against utilization of species (e.g., Kenyan proposed upgrading of lions to Appendix I in

2004). Range states have been threatened with foreign aid cuts if they vote against what the West wants and animal rights groups have been known to provide prostitutes to African delegates for their vote. It is an ideological war that the urbanized West is prepared to win at all costs. While the political elite get wined, dined and bedded around the world, Sub-Saharan Africa's rural people and natural resource base lose.

14.1.11 Loss of Forest Cover in Sub-Saharan Africa

Forest cover is disappearing at an estimated 3-5 million ha/year, mostly in forested savannas that are succumbing to the movement of small itinerant farmers onto marginal unsustainable agricultural lands, often critical dry season grazing areas for livestock and wildlife. It is estimated that the Sahelian and Sudano-Sahelian zones, along with the southern tip of the African continent, have less than 25% of their original forests remaining, much of this loss being from forested savannas. Associated with itinerant agriculture, secondary forests are vanishing as fallow lands and periods disappear and/or decline. Dry forests of the Sahel (a form of savanna) are being mined for firewood and charcoal, the major source of energy for most rural and urban Africans, respectively contributing to global warming and to an important loss of biodiversity. Natural forest management programs in West Africa, linked to the concept of *gestion des terroirs*, are attempting to return ownership and exclusive right of benefits to rural communities through rotational management of dry forests in the Sahel. It is still too early to determine how far true devolution of community resource management will develop over state-controlled decentralization that brings the bureaucracy down to the level of local government or central government representatives.

Meanwhile, many question any attempt at giving the current “green label” to European companies for sustainable logging practices in Sub-Saharan Africa’s dense humid tropical lowland forests. A major limitation to certifying sustainable forest practices in the tropics is that “sustainable tropical forest management” has yet to be defined, some considering these certification schemes to be a “greenwash” because the standards are so weak and vague that any relation between compliance and true sustainability would be impossible to verify. The German-based Forest Stewardship Council (FSC), as of 2005, had not certified any forest management operations, forest owners, manufacturers or timber traders operating in the Congo Basin:

- In many cases, forests are being selectively high graded, first cutting the most valuable timber, followed by making a second pass for timber of lower value. Since many of the most valuable species have rotational cycles of hundreds of years, questions are being asked as to how sustainable such practices may be based on 30-40 year rotational schemes;
- Meanwhile, forests are being fragmented by logging roads and the lifestyles of hunter-gatherer groups, such as Pygmies, are being destroyed; and
- Logging roads are opening up the forests to an unregulated unsustainable bushmeat trade to feed a growing urban demand that, if legalized, managed, and placed under a modern monitoring and management regime could offer an important source of income to local people, but as being practiced, is devastating wildlife populations. The killing and butchering of primates for bushmeat is now believed to be linked to HIV/AIDS jumping from monkey to man, and could see other simian retroviruses jump-over and become virulent in humans.

Sustainable forestry remains little more than a pipe dream, with logging practices being governed more by market forces than by long-term sustainability. Biodiversity losses continue to accelerate in Sub-Saharan Africa’s tropical lowland forests.

Currently, safari hunting blocks in the dense humid lowland forests of the Congo Basin (e.g., Cameroon, CAR and in the past Congo Brazzaville) using repression against the local people, provide safe havens for wildlife. Like all CBNRM programs, minimal benefits go to local people, often cutting them off from key sources of proteins and destroying local cultures, putting into question the sustainability of such neo-colonial conservation models, both hunting blocks and parks that serve to exclude local people.

14.1.12 Rural-Urban Migrations, HIV/AIDS and Poverty in Sub-Saharan Africa

Due to the shortages of land and other resources, massive rural to urban migrations are creating mega-cities and some of the worst crime ridden conditions in the world. Poverty stalks Africans behind every street corner and bush. Based on purchasing power parity, more than 50% of Sub-Saharan Africa's 622 million people still live on less than US\$ 1/day, the UN Food and Agricultural Organization (FAO)'s definition of "absolute/extreme poverty". Only in Sub-Saharan Africa, where incomes are expected to grow very slowly, are the numbers living in poverty expected to rise from 240 million in 1990 to 345 million in 2015. By then, two out of five (40%) people in the region will be living in poverty.

The proportion of Sub-Saharan Africa's population living in cities has doubled from 15% in the 1960s to over 30% today and had the highest urbanization rate in the world of 4.3%/year in 1995. It is estimated that the urban population in Sub-Saharan Africa will overtake the rural population by 2020, requiring that agricultural production and security strategies look beyond subsistence production in rural areas to supplying cheap, safe food to the cities.

It is projected that the number of cities in the region with more than 100,000 inhabitants will grow from 90 in 1990 to more than 300 in 2020. Increased urban densities will be the most pronounced and by a wide margin in Nigeria, which will have more than half of these cities. Lagos alone will have roughly 12-15 million inhabitants. Some models predict that by 2020 there will be one continuous coastal city between Lagos and Abidjan. Will these mega-cities contain an urban middleclass or slums?

In 2005, the average life expectancy in Sub-Saharan Africa is 46 years old compared to 77.6 years in the USA. More than 28 million Africans are living with HIV/AIDS, creating 12 million "AIDS Orphans" as this is being written, with the numbers increasing daily. About 70% of the HIV/AIDS infections globally come from Sub-Saharan Africa, with a large proportion being women who account for 80% of the agricultural labor force and therefore, food production.

Currently, more than 250 million of Sub-Saharan Africans lack access to safe water. More than 200 million have no access to health services. Malaria kills more than one million people/year in Sub-Saharan Africa, the majority being children. More than two million children a year die before their first birthday. More than 140 million youth are illiterate and less than one-quarter of poor, rural females attend primary school. Fewer than six of ten primary-school age children (less than 60%) were enrolled in 2000, the lowest rate of any region and far below the 84% world average - the only region in the world where the numbers of children out of school are rising. Half of the Sub-Saharan African countries show gross enrolment rates of no more than 26% for secondary education and 2.5% for higher education of school aged youth and spend less than 3.4% of their national income on education.

14.1.13 Famine, Poverty and Civil War in Sub-Saharan Africa

The global population increase of 90 million people/year demands an extra 30-40 million tons/year of grain. The first global grain deficits of 2000 increased to a shortfall of 96 million tons by 2003, forcing a drawdown of the global stockpile. Record harvests in the United States in 2004 raised the hope of breaking even. If the global grain deficit of the last three to four years continues, some say linked to global warming, the goal of food self-sufficiency for Sub-Saharan Africa becomes even more critical, as the time may come when the world may not be able to feed Africa, especially when the subcontinent's population reaches a projected 1.8 billion by 2050. In addition, the increasing use of food crops (e.g., maize/corn and soy beans) to produce biofuels as alternatives to the ever-increasing cost of fossil fuels, especially oil, could decrease the surplus of such crops from the First World available to feed the developing world, including Sub-Saharan Africa.

Acute food insecurity in 2003 affected 38 million people in Africa who faced the outright risk of famine, with 24,000 dying from hunger daily. It is estimated that the number of chronically undernourished people in Sub-Saharan Africa increased from 168 to 194 million between 1990 and 1999. It is estimated that by 2009, 60% of the Sub-Saharan African population will consume less than the minimum nutritional requirements (e.g., 1,950-2,210 calories/person/day for light activity). It appears that the targets of halving poverty and under-nutrition by 2015 will not be met on the subcontinent. There is likely to be little or no decline in the numbers of undernourished people, although the proportion will approximately halve. In Sub-Saharan Africa, an estimated 15% of the population or 183 million people will still be undernourished by 2030, by far the highest total for any region of the world and only 11 million less than the 1999 figure.

Annual per capita grain production in Sub-Saharan Africa, which averaged 147 kilograms between 1961 and 1980, fell to 120 kilograms between 2000 and 2002, a drop of 18%. Imports of cereals by Sub-Saharan countries are estimated to increase from some 17 million tons in 2000 to 27 million tons by 2020. It is projected that Sub-Saharan Africa will have a food shortage of a minimum of 32 million tons by 2020.

About 90% of the human brain growth and much of the body's growth takes place in the first five years of life, making nutrition not only a humanitarian imperative, but a basic requirement for sustained economic growth. As things currently stand, Sub-Saharan Africa has lost the race before it gets to the starting blocks in being able to compete in a global market place, with a majority of its population being adversely impacted by poor nutrition.

Hunger is particularly damaging to health, with an estimated 50% of all childhood deaths related to poor nutrition (protein-energy and vitamin A deficiency), and iron-deficiency anemia dramatically increasing pregnancy-related mortality. In 2000, 529,000 women died of birth related causes, mostly in developing countries and more than half (270,000) in Sub-Saharan Africa, while fewer than 2,500 died in developed countries.

While the single most important cause of hunger is poverty, Sub-Saharan African famines have evolved from being triggered mainly by drought to being triggered mainly by civil war often linked to "resource wars". There are two types of such wars being experienced on the subcontinent that lead to famine by disrupting traditional production systems:

- **Over Scarce Resources – Mainly Land and Pasture**

- Sahel from Senegal to Sudan;
- East Africa (Rwanda Burundi, Kenya);
- The Ivory Coast; and
- Zimbabwe.

- **Over Rich Resources**

- The Democratic Republic of Congo– COLTAN, cobalt, diamonds, oil, etc.;
- Angola – Oil and diamonds;
- Congo Brazzaville – Oil;
- Liberia - Timber and diamonds;
- Sierra Leone – Diamonds;
- Southern Sudan – Oil and other minerals;
- Equatorial Guinea – Oil; and
- Niger Delta, Nigeria – Oil.

World-wide in November 2000, there were 23.5 million people in need of humanitarian assistance due to conflict, of which 18.5 million (79%) were in Sub-Saharan Africa and of which women and children constituted 70–80% of the refugees and Internally Displaced Persons (IDPs) uprooted by this violence. In early 2008, it is estimated that 45,000 people die every month from direct or indirect causes of the war raging on in the eastern DRC, making this the most deadly conflict since World War II, exceeding the combined deaths from conflicts in Bosnia Herzegovina, Rwanda, Kosovo and Darfur in Sudan. CNN is not there so for most of the World the crisis does not exist. Of 15 UN peacekeeping missions around the world, five are based in Sub-Saharan Africa. Such disruption

and famine also have an adverse impact on wildlife and natural systems, disrupting government and traditional management systems and forcing the starving masses to mine wildlife and fuelwood among others, for short-term survival, while auctioning off their long-term future as a result of resource degradation.

14.1.14 Misuse of Foreign Aid, Subsidies, Structural Adjustment Policies, Debt and Other Foreign Policy Tools - Adversely Impacting Sub-Saharan Africa

Government-to-government handouts, “foreign aid” from the West, will not work, rewarding failure and creating a dependency culture. Over 40 years of foreign aid, along with more recent structural adjustment programs and debt relief, has had little positive impact in helping Sub-Saharan Africa achieve economic independence or food security.

Geo-politically, during the Cold War of the 1960s, 70s, 80s and 90s, by keeping countries indebted, while pouring in large amounts of “foreign aid” and ignoring corruption and its misuse, the West was able to keep a few African elite well off, while countries remained poor, dependent and exploitable by the West, both from the standpoint of natural resources and for ideological purposes. For many African elite, development failures meant more foreign aid that they could redirect for their own purposes. Corrupt and tyrannical governments often diverted aid money to military projects used to finance policing, repress opposition and/or maintain neo-patrimonial relationships that made sure the ruling elite stayed in power, or to Swiss bank accounts as “retirement” plans for African dictators in case these tactics failed.

On average, one year of foreign aid to Sub-Saharan Africa is more or less equivalent to the US\$ 12 billion Marshall Plan that rebuilt Europe after World War II, but with little to show for all of this spending. The problem is not the quantity, but how foreign aid is used. Between 1960 and 1986, the Western donors spent about US\$ 116 billion in Sub-Saharan Africa foreign aid (Official Development Assistance/ODA). In 1998, some estimates are that US\$ 13-16 billion was received in foreign aid/ODA, but only US\$ 3 billion went directly into general government budgets, while US\$ 9 billion was required to service debts. About 70-90% of foreign aid recycles to the donor country. Foreign aid has been good business for "Beltway Bandits" - Western consulting firms, construction companies, NGOs and Sub-Saharan African governments - but has had an adverse impact on Africans and their natural resources.

What most laymen do not understand is that bi-lateral foreign aid only needs a 25% grant component to be considered Official Development Assistance (ODA), the remainder being loans. Foreign aid results in massive debt. Other forms of foreign assistance are mostly loans that in theory must be paid back and also contribute to this debt. From 1991-2001, ODA comprised 88.3% of total investment in Sub-Saharan Africa, followed by 11.5% private investment and 0.2% Other Official Flows (OOF)/official assistance. Government-to-government foreign aid cannot drive economies. Until private investment/Foreign Direct Investment (FDI) comprises the majority of investment on the subcontinent, Sub-Saharan Africans will remain poor and per capita GDPs will continue to be negative.

Foreign aid, as currently practiced, creates more dependency on the West and has been counterproductive to Sub-Saharan Africa's emerging democracies, agriculture and economies in general. Over the past 20 years, the International Finance Institutions (IFIs) have provided most Sub-Saharan African countries

with loans to pay off their debt that in turn adds to their debt, an endless cycle, which they can not escape. The fact is that 99% of the Sub-Saharan African countries cannot pay back their debts. As an example, from 1989 to 2002, 38 of the world's poorest countries, mostly in Africa, received US\$ 40 billion in debt relief and still piled up US\$ 93 million in new foreign assistance loans. By the end of 2004, they owed US\$ 144 billion to multilateral institutions such as the World Bank and IMF, other countries and private banks. This is the reason the U.S. Congressional Meltzer Commission recommended that foreign assistance, including that of the World Bank, be in the form of grants only. Plans to forgive debt in 2006 only make sense if new "loaned-based foreign aid" is stopped, otherwise the debt cycle will start all over again as in the past.

14.1.14.1 Subsidies and protected markets

Dumping subsidized food under the guise of foreign aid undercuts local production. It is ironic that developed countries and institutions such as the World Bank and IMF oppose food subsidies for poor farmers in Sub-Saharan Africa to improve food production. In 2001, developed countries paid their farmers subsidies amounting to US\$ 311 billion, as much as Sub-Saharan Africa's entire economic output. Of every US\$ 1 in U.S. farm revenue, about 25 cents comes from the government, averaging \$20,800 per farmer in the year 2000. As the result of the European Union (EU) Common Agricultural Policy (CAP), while the average person in Sub-Saharan Africa earns less than US\$ 1/day, a European cow earns US\$ 2/day as a result of subsidies, reducing Africa's potential export of agricultural products by 50%, with a potential growth from the current US\$ 10.9 billion/year to nearly US\$ 22 billion/year (excluding South Africa) if these subsidies and controls were lifted. This could increase annual per capita incomes by 13% in Sub-Saharan Africa. This is not believed to include transformed products. EU tariffs protect the processing industry from products that could be

transformed in Africa such as coffee, cocoa, oilseeds, vegetables, fruit, nuts, hides and skins. Meanwhile, developing countries have been forced to “discipline” their subsidy norms as per the World Trade Organization (WTO)’s Agreement on Agriculture, allowing for a maximum limit of 10% of subsidy support under the Aggregate Measure of Support (AMS) clause.

As the result of protected markets, the average import duties on farm products to the EU and U.S. are 40-50%.

Subsidies and protected markets help the U.S. and the EU to account for 35% of the global trade in food and agriculture. The Cairns Group, comprising 17 food-exporting countries, accounts for almost 23% of the world’s agricultural exports.

The September 2003 WTO discussions in Cancun, Mexico, collapsed over differences between the West and the developing world concerning agricultural subsidies and protected uncompetitive markets, especially by America and Europe. By 2000, the USA had lifted only 13 of 750 restrictions to “free-trade” acknowledged in the Uruguay round of the General Agreement on Tariffs and Trade (GATT); the EU 14 of 219 and Canada 29 of 295. In practice, two sets of rules have been enforced: one for those allowed to and responsible for distorting the market through tariff and non-tariff barriers and one for those – the developing countries – who were not and are now legally prohibited from doing so. While there is talk of eliminating many export subsidies, it appears the earliest they will be lifted is between 2015 and 2017. Meanwhile, there are many creative ways to hide domestic trade and production subsidies under the following categories:

- **Green Box** (no, or minimally trade distorting support) including subsidies granted in the name of environment protection and preservation, and for

agricultural research and development. The “Green Box” houses up to 70% of the U.S. subsidies and remains untouched;

- **Blue Box** (domestic support linked to limits on production and exempted from spending limit); and
- **Amber Box** (all government spending in this box, unless it qualifies for Blue or Green Box) - trade distorting support. This includes market price support, direct payments and input subsidies.

Many developed countries also take advantage of protecting sensitive products under a special category of Special Safeguard Measures (SSG). Crucial commodities can be declared as sensitive and thereby be denied market access, a form of quota setting. For instance, the United States, the EU, Japan and Canada maintain tariff peaks of 350 to 900% on food products such as sugar, rice, dairy products, meat, fruits, vegetables and fish.

For instance, Africa loses US\$ 300 million a year as a direct result of U.S. cotton subsidies. In 2004, in a landmark decision, the World Trade Organization (WTO) ruled in favor of Brazil’s complaint that U.S. cotton subsidies distort world prices, violate global trade rules and price developing nations’ goods out of markets.

A combination of subsidies, protected markets and trade manipulation push down world prices for raw products (e.g., cotton, peanuts, coffee, cocoa, sugar, etc.). Desperate farmers in already over-populated Sub-Saharan Africa, in order to increase and/or maintain income levels, expand production onto marginal land, resulting in habitat degradation, increased seed densities mining soil nutrients and/or over-use of fertilizers and pesticides in attempting to increase production, impacting soil and surface water quality. In addition, there is a tendency to use the best soils and any inputs (e.g., fertilizer and pesticides) for cash crops, while

expansion occurs into marginal areas with low inputs to produce food crops, also resulting in soil mining and habitat degradation.

By 2006, trade talks suggests that while current proposals would allow both the European Union (EU) and United States to increase trade-distorting spending on agriculture, current proposals on Non-Agricultural Market Access (NAMA) would not allow poor countries to increase tariffs to protect their domestic sector from increased imports. This may carry over to disallowing tariffs to control the dumping of subsidized agricultural products from rich countries that negatively impacts jobs and livelihoods. Changing trade relations between the developed and developing world will likely be a long row to hoe.

14.1.14.2 Structural adjustment, IMF and the World Bank

G-7 countries⁵⁷⁷ have 12% of the world's population, but they use over 70% of its resources in cash terms, consuming 45 to 85 metric tons of natural resources/person/year. It currently requires 300 kilograms of natural resources to generate US\$ 100 of income in the world's most advanced economies. They appear to be willing to do whatever it takes to keep these raw resources rolling in as cheaply as possible to stimulate their economies and support their material-based lifestyles.

Although direct control through political colonialism largely ended by about 1960 in much of Sub-Saharan Africa, the West began using economic relations to indirectly control African politics, economies and access to Africa's resources. Neo-imperialistic tools and policies, such as foreign aid and structural adjustment, were used to continue meeting Western capitalistic demands, as opposed to exporting capitalism to the developing world.

⁵⁷⁷ Now referred to as G-8: G-7 plus Russia.

International financial policies continue to encourage Sub-Saharan Africa to be a major exporter of raw products, whose prices are kept low by Western controlled markets. Major exports from Sub-Saharan Africa have remained essentially the same since the 1960s, with most of the subcontinent being heavily dependent on one or two primary products; agriculture, minerals or timber accounting for 90% of Africa's foreign exchange with little or no added value from transformation. Since the 1970s, Sub-Saharan Africa's market share for these commodities has declined. Market share losses were 40% for commodities such as copper, timber and coffee, almost 60% for iron ore and 30% for cotton and cocoa. The reliance of many Sub-Saharan African countries on imports of manufactured goods left them importing more while exporting less – a continuation of the colonial formula. Their Balance of Payments (BOP) problems worsened and foreign debt burdens became unsustainable.

Many in the world today see America as “controlling the global economy”, either through its multinationals or its “puppets”, the World Bank and International Monetary Fund (IMF). The World Bank and IMF became increasingly powerful in Sub-Saharan Africa with the economic crisis of the early 1980s, which they helped orchestrate. In the late 1970s, rising oil prices, rising interest rates, a declining share in world trade and falling prices for primary commodities left many poor Sub-Saharan African countries unable to repay mounting foreign debts, the ratio of its foreign debt to its export income growing to 500% in Sub-Saharan Africa.

Structural Adjustment, IMF and the World Bank

Countries were convinced to take low interest rate IMF/World Bank loans, which were rolled over as interest rates compounded, making paying off the interest rate,

let alone the loan, next to impossible. Very often, the IMF/World Bank loans were used to service interest rates on debt. These loans, in turn, added to the national debt. Economies were driven by donors instead of the private sector, as the region was turned into one big welfare state providing cheap raw commodities to the West. Between 1985 and 1990, Sub-Saharan Africa paid out more in interest to the IMF and World Bank combined than it received from them in foreign grants and loans. Gradually, these loans evolved into a core set of economic policy changes required by the World Bank and IMF, including:

- Cutbacks in government expenditures, especially in social spending (health and education);
- Rollback or containment of wages;
- Privatization of state enterprises and deregulation of the economy;
- Elimination or reduction of protection for the domestic market and less restrictions on the operations of foreign investors;
- Successive devaluations of the local currency in the name of achieving export competitiveness;
- Increased interest rates; and
- Elimination of food and agricultural subsidies and cutbacks in agricultural extension and research.

These conditions became known as Structural Adjustment Policies (SAPs).

The underlying intention was to minimize the role of the state. Sub-Saharan African governments were required to downsize, a controversial move since with a very small private sector, most educated people in Africa were tied to government service and for every employee there were up to 20 members of the extended family dependent on his/her salary. With no private sector to absorb these people, this would mean millions of people potentially without a basic life

support network. SAP required user fees, which many people could not afford, for health care, education and basic social infrastructure, resulting in a decline in the quality of these services available to the average person. This undermined the substantial progress made in the 1960s and 70s in extending primary health care and education to redress the inequalities of the colonial era. The immediate consequence of these changes was to weaken the already precarious situation of a very large number of Africans, often resulting in social unrest. Urban dwellers in particular suffered high levels of unemployment and a serious fall in their standard of living. It is clear that neoliberal doctrines undermined education, health, increased inequality and reduced labor's share in income.

A major goal of SAP was to increase exports from Sub-Saharan African countries so as to increase their income of "hard currency" needed for servicing their debts. The IMF priority was to sort out Balance of Payments (BOP) deficits as fast as possible. Devaluation of currencies was to make exports more attractive on the global market. Currency devaluation in conjunction with trade liberalization to a large number of countries - all exporting the same crops - led to market flooding and a marked drop in commodity prices and income to most "beneficiaries", especially the small farmers of Sub-Saharan Africa. This is a reflection of northern industrialized countries under pressure from domestic corporate lobbies to keep commodity prices at consistently low prices, as well as the legacy of colonial economic relations between the North and South that continue today under the guise of structural adjustment programs and multilateral trade rules. The fact is that open borders and the export of primary products have not led to sustained development anywhere in the world.

SAP price reforms attempted to stop the underpayment of African farmers by state "control boards" for coffee, maize and other commodities, or stop artificially low prices paid to farmers in order to keep the urban masses happy. SAPs failed

to address and/or realize physical and chemical limitations of the soils, especially in the savannas where a majority of the people live and which are not conducive to permanent commercial agriculture, and that have low rainfall, declining land available/person to cultivate, an uneducated and poorly nourished populace, often very repressive climates and disease, as well as inadequate market infrastructure such as roads and storage facilities. Thus, declining terms of trade for primary products and physical/ecological constraints made great strides in agricultural production impossible. What no one is prepared to admit is that the percentage of prime soils is limited (27% of Sub-Saharan Africa). Sub-Saharan Africa's savanna environment, comprising 70-75% of the total habitat, will generally not sustainably support commercial agriculture, nor the currently out-of-balance population of people and their livestock. You can play with economies, but it is difficult to manipulate nature and come out on top.

Many small farmers were put out of business by a combination of falling commodity prices and Western food dumping, going back to a subsistence mode. Developing countries have sacrificed food self-sufficiency at the altar of world trade. Gross Domestic Product (GDP) saw some increase, between 1960 and 1980. However, per capita GDP that also increased by 36% in Sub-Saharan Africa in that time frame, fell by 15% in Sub-Saharan Africa between 1980 and 1998, during the SAP period, showing structural adjustment policies to be bogus. Sub-Saharan Africa is the only region where the annual growth of GDP per capita has been negative, at -1.0% between 1975 and 1999, compared with 6.0% for East Asia and the Pacific and 2.3% for South Asia. Some authors place the per capita GDP decline in Sub-Saharan Africa at 64%, from US\$ 671 in 1975 to US\$ 245 by 1997, most Africans being worse off than 25 years earlier. It also indicates that economies are not keeping up with human population growth.

By 1990, the continent's total debt burden stood at US\$ 272 billion, 2½ times what it had been ten years before SAPs, an equivalent to 90% of Africa's Gross Domestic Product (GDP). Sub-Saharan Africa's total income is not much more than Belgium's and is divided among 48 countries with a median GDP of just over US\$ 2 billion—about the output of a town of 60,000 in a wealthier country. Sub-Saharan Africa's share of world trade slumped from 3% in 1950 to 1.5% in 1999. While Sub-Saharan Africa is dependent on the global economy, it is being marginalized by the global economy. Some question the ability of the limited resource base and economies of Sub-Saharan African states to each support sustainably Western style bureaucracies left behind as a result of colonialism, a major reason for attempts to develop regional economic and trading blocks.

To assure that the IMF and World Bank had plenty of disciples singing the same tune on fundamental economic doctrine, the World Bank and the United Nations Development Program (UNDP) created the “African Capacity Building Initiative”, which by 2001 was training central bank and finance ministry staff, teaching at 33 African universities, along with research and joint projects. This coercion and social engineering, which has reduced public services and leadership indifference to citizen's wishes, has triggered violence across the African continent and many other places in the world.

A major shortcoming of structural adjustment is that it is based on government-to-government loans. Governments are not entrepreneurial by nature. The hypocrisy of it all was that adjustment reforms were to be implemented by the very state, which was intended to be “reduced”. The governments were rewarded with renewal of financial aid, but should have needed less aid if these reforms stimulated Foreign Direct Investment (FDI) and economic growth, which they did not. The elite practiced what some call “politics of the mirror”, going through the motions of fulfilling World Bank, IMF and donor condition precedents, but with

little actualization at the implementation stage. In turn, the elites redistributed much of the foreign aid to maintain their power through neo-patrimonial relationships. Structural adjustment/foreign aid were “Africanized”. The spin offs included new Mercedes Benz’s (In Swahili these elite are called “*Wa-Benzis*” – literally in the eyes of local people, they have turned into a tribe) which they otherwise could never afford, free trips overseas and skimming or redistributing loan/grant money that is often not very well accounted for.

Meanwhile, in Sub-Saharan Africa (SSA), people living below a poverty line, as defined at US\$ 1/day, increased from 217 million to 291 million from 1987 to 1998, averaging around 46% of the total population over this period. The net result of structural adjustment policies is that of the 32 countries globally classified as severely indebted low-income countries, 25 are in Sub-Saharan Africa. It is believed that the rise in the bushmeat trade that is devastating wildlife populations in the dense humid lowland forests of the Congo Basin has much to do with SAP policies lowering the prices paid for farmers for coffee and cocoa.

It would seem that the Third World is being forced to take a medicine often ignored by the First World. Ultimately, SAPs contributed to the proletarianisation of the middleclasses, bringing an army of bureaucrats, intellectuals and professionals into the ranks of workers, peasants and the unemployed. SAP policies discouraged government subsidies for important social services, such as education and health, needed to assure advancement of society, encouraging *laissez-faire* economics, resulting in extremes of lifestyles between the elite, virtually no middleclass and the extreme poor in Africa and other developing countries, a form of capitalism abandoned by the West a century ago.

Ultimately, post-independent governments in Sub-Saharan Africa were driven into a cul-de-sac by the neoliberal policies of SAP, both locally and globally. The U.S. Congressional Meltzer Commission has suggested that the IMF should provide advice on economic policy, but not impose conditions. In other words, SAP should be done away with, in addition to the Commission also recommending that the IMF be downsized and that it should only provide short-term liquidity assistance to governments. Ultimately, many of SSA's resource rich countries should require minimal foreign assistance if the West holds them accountable for reinvesting the wealth generated from these resources back into the development of the people (health and education) and the country (e.g., infrastructure), both of which should encourage Foreign Direct Investment (FDI).

One of the largest economies in the World, the USA, seems to function almost as well under a balanced budget (William (Bill) Jefferson Clinton Era) as under deficit spending (Reagan and Bush Administrations). In the North, state intervention from education and health care to agricultural subsidies, as well as protected markets in Europe and North America, along with cheap raw products from the developing world, guarantee their citizens the highest material standards of living in the world. This may be considered a form of "global economic Apartheid", keeping Sub-Saharan Africa and other Lesser Developing Countries backwards and stagnant at all levels, economically and socially. A few living off the backs of the rest of the world cannot be sustainable.

Industrialization, which Europe and North America experienced in the 21st century, has escaped Sub-Saharan Africa. Where industrialization has taken place, corporate mercantilists, moving to areas with cheap labor, tax breaks and minimal environmental protection, are transferring industrial production costs to society and banking those unpaid costs as profits. The net result is more poverty and less education for average Africans/Developing World and increased profits for the

multi-nationals and the already super-rich, often political elite of the host country. Up until now, in most cases, no middleclass has been created and pollution, both in the work place and externally, has been a major problem. One has to only visit Mathare, Kibera (about 1 million people living there) and other slums, and observe the pollution to see industrialization and urbanization gone awry around Nairobi and Athi River, Kenya.

14.1.15 Eco-Colonialism and Eco-Genocide Resulting from Foreign Aid in Sub-Saharan Africa

The “export-led growth” model on which the fund and the World Bank insist, is a purely extractive one, involving more “mining” than management and conservation of resources (e.g., timber, mining, fishing, soils).

At the same time, the West through the IUCN, bolstered by Western preservation, conservation and development NGOs, pressurize Sub-Saharan African countries through donor handouts and perks for the political elite (e.g., *per diem* trips, scholarships, vehicles and computers, etc.), to place 10% or more of their land into park and protected areas, which exclude rural Africans from accessing their resources. Reminiscent of colonial history, this is resulting in the increased impoverishment of rural Africans, as a result of continual compression onto land that cannot support them economically, nutritionally or ecologically.

A Western urban majority, desiring to escape from the concrete jungles of the big cities, perceives nature as a pristine environment, untouched by human hands, a nirvana bathed in warmth and beauty that cleanses and heals the soul. This assumes a mythical “Wild Africa” that never existed prior to colonization, people always being an integral part of African ecology. On the other hand, rural, impoverished, subsistence-living communities perceive a need to live from the

resources contained in these natural systems, and are alienated from the urban perceptions and desires of rural landscapes imposed on them. This is resulting in a clash of cultures and livelihoods across Sub-Saharan Africa, as the urban world, controlling both wealth and politics as exemplified by foreign aid, wants exclusion zones.

For instance, in 2004 the following percentage of Sub-Saharan African countries are in protected areas as defined by the IUCN, for the most part, exclusion zones for rural communities:

Botswana, 30.19%	Burkina Faso, 15.36%	Cameroon, 15% heading towards 30%
CAR, 16.59%	Congo, 14.25%	Ethiopia, 16.86%
Ghana, 15.46%	Malawi, 16.28	Namibia, 18.3%
Tanzania, 39.85%	Uganda, 26.29%	Zambia, 41.49%
Zimbabwe, 14.72%		

In blunt terms, the “biodiversity conservation”, exported by the West to Sub-Saharan Africa and other developing regions of the world, is for rich Americans and Europeans who can buy their food in a supermarket.

An important point that needs to be made is that rural Africans have never been sustained solely on farm production, as purported by Western donors and NGOs. Farm production has always been complimented by resources extracted from natural systems. This is one reason integrated rural development of the 1970s/80s pushed by the West failed – attempting to solve all the problems on the farm (e.g.,

agro-forestry, fish farming, farming cane rats, farming herbal medicine, etc.), when right next door, in secondary fallow or natural forests and savannas, these resources were in abundance. Although increasing human populations require more intensive management of these wild resources to assure their sustainability, the Western solution of creating more protected areas that cut off rural communities from accessing their natural resources is doomed to failure.

As in the past, under colonialism, the outcome is ecological degradation and resource mining in the compression areas, with parks and protected areas becoming hard-edged as a tidal wave of poverty risks to inundate and consume the exclusive playgrounds of Western researchers, hunters and eco-tourists. In creating these areas and in placing themselves in direct conflict with rural livelihoods, biodiversity is being jeopardized in the long run by forcing rural people to poach, since legal access is not possible. This is resulting in the creation of “Open Access Resources” in protected areas being mined for short-term gains by rural Africans out of anger, frustration and the need to survive and in worst state conditions, in eco-genocide through destruction of traditional hunter-gatherer and nomadic minority cultures. Once clandestine access to resources occurs, the sustainable management of wildlife and other natural resources becomes difficult since it is impossible to monitor the offtake, with the ultimate result being habitat and resource degradation; a loss to both local communities and to the world’s urban majority. Where revenue sharing exists, local communities receive a pittance of the net profits. Rural Africans quickly learn to hate NGOs and Caucasians, who appear to be more concerned about wildlife than people, and “their” governments whom they see as having sold their lands and natural resources to foreigners.

Meanwhile, African governments are threatened and dictated to by Western animal rights NGOs, for instance: 1) with tourism boycotts if wildlife is given back to the landowners that allows maximizing income from trophy hunting in

Kenya, 2) tied-aid as in Kruger National Park, South Africa, in which a condition was no elephant culling, or 3) threatened boycotts of the tourism industry if elephant culling takes place in national parks and protected areas (e.g., in Botswana) to conserve biodiversity and habitat, as well as to sustainably generate food and income. Welfare dependent African countries, who know what interventions are needed to sustainably manage and generate maximum wealth from their natural resources, consumptive and non-consumptive, are being hampered from doing so by an urbanized West that lacks ecological, cultural and economic understandings of the links between people and their environment in Sub-Saharan Africa.

Foreign aid funneled through Western NGOs via Global Environment Facility (GEF) programs supported by the World Bank, E.U. and U.S.A., including Transfrontier Conservation Areas (TFCAs), are at the basis of this eco-colonialism at the beginning of the 21st century. For instance, a Global Environment Facility (GEF) program in Southeastern Cameroon has resulted in Baka Pygmies losing 70% of their forests to safari hunting blocks and parks. The Baka or “Forest People,” the only group capable of living for extended periods in the forest to protect its resources, have been expelled and confined to narrow “Community Hunting Area, Cameroon/*Zone d’Interet Cynégétique a Gestion Communautaire (ZICGC)s*” along major roads, where human populations are concentrated and where wildlife already tends to be over-harvested. The expulsion and marginalization of rural people from accessing their natural resources in the name of conservation might be considered a form of eco-genocide; though to date, no one has been held responsible. This is not new and is a repetition of colonial policies that destroyed cultures across Sub-Saharan Africa, such as the Waliangulu of Tsavo National Park in Kenya, the Ik of Kidepo National Park in Uganda and the Bassari of Niokolo Koba National Park in Senegal, and continues today with, amongst others, the Basarwa/San in the

Central Kalahari Game Reserve (CKGR) (in 2006 high court ruled San illegally evicted from this ancestral land and should be allowed to return) and the Baka Pygmies, as well as just north to the Baveuk, Babouté and Bouté ethnic groups around the newly established Mbam and Djerem National Park and associated hunting blocks in Cameroon.

“Revenge killings” of lion, elephant and rhino in East Africa by Maasai, who have co-existed for centuries with wildlife, illustrate the frustration of rural people. The September 2005 de-gazetting of the world famous Amboseli National Park, Kenya, could prove positive if taken advantage of by the Maasai, or could prove to be the beginning of a reversal in which human population pressures accelerate conversion to man-made systems of Sub-Saharan Africa’s natural areas by those who have been alienated by this form of conservation elitism.

Ultimately, for many indigenous Africans, conservation policies have meant a loss of anchors linked to their cultural and social identities. All over Sub-Saharan Africa one observes incidences of indigenous people kicked out of their traditional world, inadequately prepared to join in the new outside world to which they are exposed – mostly a Western and, more recently, a global world in which they are ill prepared to compete, both psychologically and intellectually, lacking an appropriate education. Alcoholism is a major escape, similar to problems in North America on Indian reservations.

14.1.16 Community-Based Natural Resource Management

In an attempt to rectify some of the inequalities of the past, beginning in the late 1970s in Zimbabwe, a program began to share economic benefits from wildlife with rural communities as a means of coercing them into modern conservation ethics. This became known as Community-Based Natural Resource Management (CBNRM), but appears under many names, including Integrated Conservation and Development (ICD), Community-Based Conservation (CBC), Community Wildlife Management (CWM), Collaborative (or Co-) Management (CM) and Protected Area Outreach Projects.

CBNRM has tended to be about management and benefits from “Common Property Resources”, below government at the level of village or cluster of villages and an assumed homogenous society. However, it is being recognized more and more that many rural small-scale societies are heterogeneous; economically stratified with various resource users vying for access to a given geographic area, and porous with people coming and going, especially in recent times as rural livelihoods more and more depend on remittances from urban centers for survival.

Traditionally, it was about communities living outside of parks, benefiting from the sustainable use of resources in these areas, especially wildlife from trophy hunting; the Southern African model. It tended to be high-jacked by Western donors and NGOs. Too often, it has been “talk community”, but act “neo-colonial”, maintaining the same old ties between a predominantly white safari and tourism industry and governments, along with modern-day evangelists – conservation NGOs. There is a general failure to devolve land and resource tenure to local communities, with continued exclusion of rural people from these natural areas. Too many stakeholders have too much to lose if title to wildlife and

land are fully returned to their rightful owners; traditional rural small-scale societies. Little of the profits from valorizing the subcontinent's natural resources are reinvested back into conservation or development, most of the wealth being expropriated by elites and the mostly expatriate private sector into overseas bank accounts and urban lifestyles.

CBNRM is part of the solution to conservation and development, but on its own will fail since, while it may serve as a catalyst for development, economic and social impacts at the level of households are negligible, providing the equivalent of:

- US\$ 18.8/household/year, CAMPFIRE Zimbabwe;
- US\$ 17/household/year, ADMADE, Zambia;
- US\$ 5.90-9.39/household/year, Tchuma Tchato, Mozambique;
- US\$ 79-196/household/year, Nyae Nyae, Namibia;
- US\$ 2.41-12.43/household/year, Cullman/Hurt, Tanzania;
- US\$ 2.25-2.79/household/year, Selous Conservation Program (SCP),
Tanzania; and
- US\$ 872-9,577/household/year, Botswana Community Trust Program.

Too often, this revenue never reaches the households, being used for Common Property Benefits (e.g., roads, schools, clinics, boreholes and grinding mills).

CBNRM is often too narrowly focused on a limited use of the resources (e.g., hunting of wildlife or ecotourism). CBNRM, as currently practiced in Sub-Saharan Africa's communal areas, yields about 85% of net profits to governments and the private sector (largely expatriate) primarily from safari hunting and ecotourism, leaving about 15% for rural communities.

Even if this disparity in benefit distribution can be rectified, in much of Sub-Saharan Africa the ratio of resource base to people is so low that in most cases potential benefits would still be insignificant at the level of households. For

instance, the figure on CAMPFIRE is based on generating US\$ 15,856,128 million in the 11 year period from 1989-1999. However, when split between about 95,000 heads of households each year, the amount becomes insignificant. Even if you could triple the amount to between US\$ 45-48 million over this time frame, the benefits per household are still very small.

In fact, as currently practiced, the household often gives up more than it receives from CBNRM – access to the diverse array of natural resources (wildlife, timber, charcoal, thatch grass, fish, honey, other wild food, medicine, etc.) in these protected areas in return for “Common Property Benefits” (schools, clinics, grinding mills, boreholes) that remunerate the community, but not the individual and/or his/her family. As a result, at the level of the household, people are often poorer as the result of CBNRM, which on its own does little to convince communities or individuals to “buy-in” to modern conservation concepts that are exclusionary. CBNRM, as currently practiced, might even be considered a failed communist experiment, where Sub-Saharan Africa’s true entrepreneurs (e.g., traditional hunters, fishers, sawyers, charcoal makers, honey collectors, traditional medicine collectors, etc.) are marginalized and criminalized from using resources, in favor of valorizing resources through mostly expatriate companies.

Kept relatively ignorant, most communities in Sub-Saharan Africa have little understanding of the potential value of wildlife and other natural resources on the international market and are thus easily taken advantage of and maintained dependent on governments, the private sector and NGOs in the management and marketing of their resources – all middlemen who directly (governments and private sector) or indirectly (governments and NGOs) live off the community’s resources. Donor funding for CBNRM becomes a major source of income for governments and NGOs, with purported decentralization resulting in increased centralization of control over natural resources by the state. This is often

encouraged by NGOs (eco-missionaries coming to save Africa from Africans) who make themselves indispensable middlemen that are needed to “help” communities meet the myriad of bureaucratic red tape imposed on them in order to legally access resources they had sustainably managed on their own for centuries. Western money implies Western NGOs/experts and thus imposition of Western value systems that are unacceptable to other cultures, especially those whose precarious lives depend on accessing these resources; eco-colonialism (e.g., CAMPFIRE in Zimbabwe, Southeastern Cameroon, Congo Brazzaville, Kenya, Tanzania).

Concern has been raised that Transfrontier Conservation Areas (TFCAs) increase the scale of this centralization and disenfranchisement. Rather than helping rural communities manage these resources, Western donor money through NGOs continues trying to exclude local people from their access on an even grander scale.

14.1.17 Inappropriate Uses Of Western Technology In Sub-Saharan Africa

Inappropriate use of Western technologies has been funded by Western donors and put into place by Western companies and NGOs, such as dams on rivers and boreholes. Dams are big business, with little or no accountability to design and construction companies, governments or donors. While environmental assessments are undertaken, mitigative measures are rarely implemented, especially artificial flooding to maintain downstream ecosystems. Major impacts of dams in Sub-Saharan Africa include:

- A downstream loss of flood plains adversely impacting recession agriculturists, herders, fishermen (e.g., 500-800,000 people impacted in Senegal/Mauritania from Manantali Dam, Mali; 350,000 from Cahora

Bassa Dam, Mozambique; hundreds of thousands from Kainji Dam, Nigeria);

- A decline of floodplain fisheries;
- A decline in dry season pasturage on floodplains for livestock and wildlife;
- A loss of floodplain wetlands for migratory birds;
- A decline of estuarine/marine fisheries;
- A displacement of people and/or loss of habitat within inundation zones behind dams (e.g., 57,000 people displaced by the Kariba Dam in Zimbabwe/Zambia; 42,000 displaced by Cahora Bassa Dam Mozambique; 84,000 displaced by Akosombo Dam, Ghana; 120,000 people displaced by Aswan High Dam; 44,000 from Kainji Dam, Nigeria; 24,000-30,000 farmers lose land from three dams in Lesotho); and
- An increase in aquatic borne diseases such as malaria and schistosomiasis.

From a combination of increases in human/livestock populations, as well as the inappropriate placement of boreholes without providing extensive livestock systems with training to move into intensive management, by the mid-1980s, 90% of Sahel-Sudan grasslands and 80% of Southern Africa's grasslands were/are over-grazed.

The world's coral reefs may be in greater jeopardy than tropical forests. By 1998, 11% of the world's coral reefs had been destroyed by human activities and 16% had been damaged by global warming. Currently, of the 6,800 km² of reef off East Africa, 12% has been destroyed, 23% is at a critical stage - soon to be destroyed unless remedial steps are taken - 25% is threatened and 40% is under low or no threat. Meanwhile, while not built out like the Florida Keys or the Caribbean islands, East Africa's coastal zones are slowly being discovered as a pristine tourism Mecca. There is little or no sensitivity for the implications of

land-based pollution, especially from inappropriate sewage technologies adopted by coastal strip development for tourism that can destroy the very attractions that bring in the tourists: white sandy beaches, clear blue waters, seafood, coral reefs, SCUBA diving and sportfishing. Very often, with pressure from Western NGOs, marine parks are created, excluding rural fishing communities, blaming the demise of coral reefs on over-fishing of herbivores “Top-down” hypothesis rather than dealing with the more complex issues of nutrient pollution from sewage (often from insensitive temperate climate tourism developers) and land-based pollution in general from watershed degradation – “Bottom-up” hypothesis. While over-fishing can be an issue, fishermen are more often the victims rather than the major cause of this problem. There is a movement afoot to involve local fisher communities in coastal management.

Coral reef ecosystems collapse as result of being smothered by epiphytic algae (benthic macro-algae) that out-competes corals under nutrient enriched conditions. Epiphytic algae prevents zooxanthellae (a symbiotic algae living within the coral polyp - providing the coral with food and giving it color) from photosynthesizing and prevents polyps from filtering micro-organisms out of the water column. With its food supply cut off, the coral starves to death. Sedimentation and pesticides from degraded watersheds can also be an issue. Once the coral reef dies: 1) Major beach erosion occurs as the reef, that provides sand to nourish the beaches and protection of the beach against wave and storm action, is gradually broken down, 2) The loss of habitat results in a decline in artisanal fisheries, 3) Increased eye, ear and skin infections and diarrhea become the norm among swimmers/bathers and 4) Ultimately, there is a decline in tourism.

While global ocean warming has become a major issue, resulting in coral bleaching and a major die-off of coral reefs in the Western Indian Ocean since

about 1998, this must be dealt with on an international level through such forums as the Kyoto Protocol. On the other hand, land-based pollution including sewage, and over-fishing are issues that individuals, communities and governments can deal with directly.

14.1.18 Resource Wars Fueled by the West in Sub-Saharan Africa

Foreign multi-nationals, in collusion with Western governments, have played off various factions of tribal and political elite to access Africa's riches (e.g., oil, minerals, timber), often vying for control over access to these resources through proxy wars, using African governments and armies. Towards the end of the 20th and at the beginning of the 21st century, this has been especially true between the French and Americans, as well as various African elites who are vying for the riches of Francophone Africa's oil in the Gulf of Guinea and the mineral wealth of the Democratic Republic of Congo, amongst others. In the Democratic Republic of Congo, this has resulted in Africa's first "World War".

Cheap oil fuels America's economy. Global oil discoveries peaked in the mid-1960s. U.S. oil production peaked around 1970 with imports accounting for 66% of its oil and petroleum products in 2005. Global oil production is predicted to peak between now and 2040, while unfavorable political and investment conditions exist where 60% of the world's oil reserves are located. By the year 2015, the USA expects to obtain 25% of its oil from the Gulf of Guinea. Access to this oil becomes even more important in lieu of chaos in the Middle East and crude oil surpassing US\$ 75/barrel by April 2006 and US\$ 80/barrel by mid-September 2007.

Government elite, in cahoots with Western government and multi-nationals, expropriate the wealth of rural communities (e.g., wildlife both consumptive and

non-consumptive, minerals, timber, etc.) into overseas accounts. There is little investment by governments in providing basic services such as infrastructure, health care or universal education. Thus, even in the 21st century, it can be argued that in much of Sub-Saharan Africa, democracy becomes a façade for communist-like politburos doomed to ruination of the subcontinent, while the true owners, small-scale rural societies, are disenfranchised and forced to live in poverty.

As a result, compared to the West, there is limited buying power, the failure to develop consumer societies and little demand for transformed products that would stimulate local industry, trade and ultimately, national and regional economies. The net result is that economies are stagnant and/or declining on the resource richest continent in the world.

14.1.19 The Brain Drain

The ultimate “slap in the face” to Sub-Saharan Africa is the overt or subvert stealing of Sub-Saharan Africa’s best and brightest. An estimated 30-40% of college graduates from Sub-Saharan Africa have immigrated to developed countries including the U.S., Britain and France (e.g., Gambia/63%, Ghana/46%, Kenya/38% and Angola/33%). This has occurred by providing scholarships and allowing the brightest to remain in America and Europe. Or, as a result of stagnating and/or declining economies knowing that those receiving scholarships to America and Europe will do anything not to go back, where someone with a masters or doctoral degree can make more as a taxi driver or student assistant than working back home in their profession. In some cases, there is active recruitment (e.g., nurses to England). UN statistics show that professionals leaving Africa to work abroad increased from:

- 27,000 from 1960-1975;
- 60,000 from 1985-1990; and
- 200,000 from 1990-1999.

Other's estimates are even higher, with as many as 640,000 African professionals living in the USA, of which 360,000 have PhDs.

The pace of the diaspora is accelerating. Today, up to 70,000 Africans/year are fleeing the continent in search of a better life. There are more African scientists and engineers working in the USA than in Africa. By some accounts, there are as many as 840,000 South Africans in London and many more in Canada, Australia, New Zealand and the USA. An estimated 1,800 African health workers emigrated between 1960 and 1975, increasing to 8,000/year by 1987 and to 20,000/year during the 1990s. Nigeria alone has an estimated 33,000 doctors living in the USA. The EU's planned "blue card" will be used to "cherry pick" the best and brightest from Africa to fill job vacancies left by an aging populations. This loss of educated manpower is hurting Africa's chances for success. Similarly, on a continental scale, many of the subcontinent's brightest who cannot make it overseas are flooding to South Africa and filling posts, while the influx of illegal and uneducated Africans into South Africa is placing a tremendous burden on its social (education and health systems), as well as physical infrastructure (e.g., water, sewage, housing, roads).

14.2 THE WAY FORWARD –A ROADMAP FOR THE FUTURE

This paints a very bleak picture for Sub-Saharan Africa. How can Africa get out of this seemingly "free fall" without a parachute? The following is a roadmap that might be considered by African leaders, implemented through the New Partnership for African Development (NEPAD), if it can avoid the neoliberal

policies of the Washington Consensus. The roadmap presented in this book is not arrogant enough to think that it has the solution for the continent. Previous chapters provide decision makers with a historical perspective of what put Sub-Saharan Africa in this predicament. To understand the future you must understand the past. This “roadmap” attempts to integrate a set of interlinking ideas presented in previous chapters that can, through careful planning, be implemented to change the way Sub-Saharan Africa is functioning. What is needed is not “rocket science”, but a break away by Africa and Africans from continuously having Western solutions to achieve Western objectives imposed on the subcontinent, usually to the benefit of the West, but to the detriment of Africans and their natural resources. Major paradigm shifts will be needed as to how Sub-Saharan Africa relates to the West and visa versa, as well as how Sub-Saharan Africans relate to each other locally, nationally and regionally across the subcontinent. A long-term vision will be needed for Sub-Saharan Africa to escape out of these doldrums.

It should be made very clear that if significant change cannot be achieved over the first half of the 21st century, Sub-Saharan Africa’s people and its mega-fauna will all be in jeopardy. Failed rogue states will evolve (e.g., more Somalias, eastern DRC), which are ungovernable and that will fall outside the attempts of global cooperation through such bodies as the United Nations and the World Trade Organization (WTO). In addition to threatening the future of civil society, environmental degradation will accelerate, jeopardizing Africa’s natural resource base. Anarchy will reign on the continent and civil wars and strife over scarce resources will be the norm (e.g., as already seen in the DRC, Ivory Coast, Liberia, Sierra Leone, Niger Delta). Genocide (e.g., Darfur, Rwanda, eastern DRC) will increase as ethnic factions vie for control of the remaining resources. Coastal mega-cities will become Africa’s jungles, where the majority living in their slums will be stalked by two-legged predators and any hope for Foreign Direct

Investment (FDI) will be lost, as capital (both human and financial) and technology flee the continent. The elite will live in gated communities (as is the current trend in South Africa) with electric fences, rapid response Private Military Companies/Contractors (PMCs)/security as the only option to an over-whelmed police force.

Europe and industrialized South Africa will be inundated by a tidal wave of poverty escaping these failed nation states, and worse – many of the disenfranchised and disenchanted youth will provide the foot soldiers that fanatical terrorist movements seek to carry out their ideological war against what most of them perceive as an opulent West living off the backs of the developing world. Africa is on the verge of becoming a Muslim continent of which Sub-Saharan Africa alone has an estimated population of 250 million Muslims or 20% of the World's Muslim population. Though Muslims are traditionally moderate, poverty, corruption and political alienation are contributing to the spread of radical Islam in Sub-Saharan Africa such as in Sudan, Somalia, Eritrea and Kenya, while Nigeria with 60-million Muslims has already seen Islamic law adopted in the north, often contributing to religious tensions and violence. The 1998 bombings of U.S. embassies in Kenya and Tanzania are omens of worse to come unless the subcontinent sees major changes in its residents' quality of life.

It appears the mastermind of the July 2005 London subway bombings may have used Southern Africa as an operational base. A flood of lumpens is beginning to inundate Europe, as epitomized in 2005 by 11,000 Sub-Saharan Africans trying to scale the razor wire fences in the Spanish enclaves of Ceuta and Melilla on Morocco's Mediterranean coast, and more recently in 2006, 32,000 illegal aliens from West Africa arriving in the Canary Islands in hopes of gaining access to the mainland and a new life. For the West to maintain a decent quality of life, it will

be required to uplift and provide hope for a better future to populations of the Third World.

This decline can be stopped, but it will require a concerted effort by African leaders to do what is right for their people. In addition, the West will have to develop a win-win relationship with Sub-Saharan Africa instead of seeing it as a continent of plunder, which it has been since the first contact with Europe and which continues unabated at the beginning of the 21st century through resource extraction.

The West needs to wake up and realize that while separated by seas and oceans, the future of Africa may very well hold in its hands the future of Western civilization as we know it today. Neither segregation in America nor Apartheid in South Africa were sustainable and the materialistic lifestyle of the West, if it depends on living off the developing world, keeping its people in a perpetual state of downward spiraling poverty and hopelessness, is also not sustainable. Terrorism has been around since the beginning of humanity. It is how the weak have stood up to abuse by the powerful, and can only be overcome in developing win-win relationships with the rest of the world.

14.2.1 Policy Changes for Sub-Saharan Africa

14.2.1.1 Education

General

A “massive” emphasis on education at all levels, primary, secondary (high school) and tertiary (university) must serve as the basis for the road map – an education that links traditional African values to modern Western intensive

management systems that the continent must “adapt” not “adopt” within its socio-cultural framework. This will help Africa benefit from both regionalization and globalization and address resource degradation from over-population. Education must take place in Sub-Saharan Africa, with South Africa playing a major role through NEPAD in first helping to educate Africans at its First World tertiary institutions, creating a generation of Africans who can find “African solutions to African problems”, forgoing the need of having “experts” from the West imposing ideological and technological solutions that often meet neither the ecological nor socio-economical needs of the continent. For instance, though not having an adequate plan to absorb youth back into the country, Botswana has wisely used its revenue from diamonds by investing in its youth, sending thousands on scholarship to universities, many in South Africa. Botswana, its people and its economy will become a better place because of this effort. In the long-term, South Africa, through the NEPAD process, must help strengthen and reinvigorate tertiary training on the rest of the continent. The use of Interactive Telematic Education (ITE) to broadcast university classrooms from South Africa across the subcontinent should be considered. A major challenge within South Africa is to improve the standards of its primary and secondary education in the townships and rural areas so school leavers can compete at the university level rather than dropping the standards of its tertiary institutions to meet prescribed graduation quotas!

Appropriate education, allowing Africans to join a global economy, will help take advantage of the growing rural exodus, drawing more youth out of these areas, thereby taking pressure off Sub-Saharan Africa’s ecosystems, most of which are degraded from overpopulation by humans and livestock. This will require training in such diverse areas as business, accounting, marketing, information technology and engineering.

Adult, education – yes, there is likely some value in this, but the future is in Africa's youth and if education is practical, especially in the rural areas, why cannot youth serve as “agricultural extension agents” to their families and villages, where governments given limited resources are unable to completely fulfill this task. In less than a generation, with appropriate education, as exists in America and Europe through vocational schools, those youth choosing to remain in rural Africa will become the farmers already trained in appropriate technologies and not needing “adult education”. Then there is the age old adage, “you cannot teach an old dog new tricks” so work with the puppies.

The West must assure that any student sent overseas on a scholarship be legally, as well as morally, bound to return to his/her country of origin, contributing to the betterment of his/her society. Care must be given to tailoring education to the need, over-educated individuals often being unwilling to return to rural areas or even to their countries. Experience shows that students coming out of structured programs, such as community-based conservation and development NGOs, tend to be more willing to return on completion of their studies, reintegrating more easily back into their society. South Africa must look deeply within as it begins to play a similar role in being a major service provider in education on the subcontinent. If this means revoking his/her visa to assure the student's return to his/her country of origin, so be it.

Agricultural Education

As a part of this educational program, there is a need to develop agricultural training and “future farmers of Africa” programs in primary and secondary schools for those youth who choose to remain in rural settings. In addition, taking advantage of Africa's racial diversity, as young Africans graduate from tertiary agricultural training, there is a need to develop on-the-job training programs with

commercial farmers and agro-industries. They must be “apprenticed” on these farms until they can run and manage such operations, from planning crop production to managing farm labor, soil and water quality monitoring, soil conservation and fertility management and use of technologies such as drip irrigation that will have to be adapted to make these processes sustainable. They must be trained to make decisions, not take orders, as has been the case under colonialism.

The current commercial agricultural technologies are mostly in the hands of white Africans. These technologies must be transferred to small and medium black farmers where appropriate, taking them from subsistence into commercial agricultural production. Already, South Africa has pilot “mentoring” programs teaming up white commercial farmers with small black farmers and/or carefully selected black agricultural students showing entrepreneurial skills from tertiary institutions. Nigeria is inviting disenfranchised Zimbabwean commercial farmers to re-establish, farm and train small Nigerian farmers in the latest technologies. If Sub-Saharan Africa is to survive, tribalism, racism and other socio-cultural and political constraints will have to be put aside, and all Africans will have to work collaboratively.

Wildlife and Range Management Training

The largest portion ($\approx 75\%$) of Sub-Saharan Africa consists of the savanna biome, whose best land use is in livestock and wildlife. There is a crying need to send off youth from these rural areas to be trained in modern concepts of intensive wildlife/range management and expose them to the potential for consumptive and non-consumptive tourism in these areas that can serve as a catalyst for rural development.

Youth representing rural communities, trained in this sector at the tertiary level, can help their communities demand and take back control over their land and associated natural resources. Protected areas must be developed by educated rural Africans returning to their communities, which integrate the needs of rural communities into the management of these areas, as opposed to the current trends where communities are still being cut out and intermediaries are still reaping the majority of the economic benefits. Until the majority of people comprise an urbanized middleclass, there is little room for preservationist exclusion zones, which risk disappearing under a wave of human poverty that sees no value in their existence and which is a foreign concept to most Africans, imported from Europe and America.

Mid-level training can be obtained in Africa's classical wildlife colleges such as Mweka in Tanzania and Garoua in Cameroon, along with the more recent Southern African Wildlife College. However, these institutions need to move away from their colonial roots of training paramilitary forces to fight rural communities. The philosophy of these schools and their curriculum needs to be redesigned to train wildlife extension officers and ultimately, community members to sustainably management the multitude of wild resources in their areas, not in cutting them off from survival.

At the tertiary level (university level), South Africa has First World quality educational programs that have taken Western concepts of intensive resource management and adapted them to Sub-Saharan Africa. Training in intensive natural resources management will be necessary due to previously appropriate extensive management systems being usurped by an ever-expanding human and livestock population. South African universities, national parks, provincial nature conservation authorities and private game ranches know more about managing their indigenous fauna than any people on this planet and it is precisely this

knowledge that must be transferred throughout Sub-Saharan Africa. The pool of savanna ecological expertise in South Africa is the world's best chance at establishing intensive range management on the subcontinent, so necessary as a result of increased people and livestock in the last century, resulting in more pressure on a declining per capita and gross (e.g., savanna taken out of production by conversion to farms) resource base. As they are situated on the African subcontinent, South African universities reflect the needs of their citizens who are still closely tied to living directly from nature, promoting sustainable use of wildlife as a land use, often not recognized by Western universities and donors.

These universities are much more affordable than European and North American universities (e.g., US\$ 7,000/year all inclusive, including transport, compared to US\$ 15,000 minimum in most American universities), and relevant since they train people in the sustainable management of African wildlife and habitat.

On returning, trained youth must take these concepts of intensive resource management from what the White Mountain Apache's call the "white man's world" and integrate these into traditional management systems linked to social controls, ancestors and the spirit world. Traditional control mechanisms such as hunting guilds, chiefs and elders, taboos, totems and territoriality can comprise important components of this integration. Where feasible, traditional resource users need to be invited into the classrooms to lecture students on knowledge that is rapidly being lost.

Similar to the "Foxfire" series of books on traditional knowledge in Appalachia, USA, there is a need to record and capture this knowledge in writing and on film as both an educational tool and to archive knowledge and beliefs that may disappear in the next generation as society urbanizes and traditional ways of life, other than for a few, become a thing of the past. Recording such information and

suggesting how to integrate it into modern intensive resource management concepts can be undertaken by Africans for advanced degrees.

Initially, one of South Africa's roles, through the New Partnership for Africa's Development (NEPAD), should be to educate people from the rest of Africa, eventually linking to other tertiary institutions on the continent and bringing up their standards of education, which have declined drastically since independence. The long-term goal must be to have the majority of Africans trained in their country of origin. These basic concepts will equally apply to range management for livestock.

Forestry, Fishery and Coastal Management

Similar training needs will be required for other natural resources. Over much of the subcontinent, sustainable forest management will be critical to sustainable wildlife management, especially in forested savanna and tropical lowland forest environments that provide habitat for wildlife. With the exception of South Africa, it should not be forgotten that charcoal is still the major source of energy for the majority living in the urban centers of Sub-Saharan Africa.

Information Technology

Through collaborative efforts with the West, information technology (IT) will provide major job opportunities in Africa's urban centers as we move into the 21st century.

There is a crying need to improve information technology training linked to improved telecommunications in Africa. Beginning at the primary and secondary schools, children need to be hooked in so that computer and information

technology starts out as a play thing that they grow up with as a natural part of their lives, as has happened in North America and Europe.

A good example for a start is in Uganda, where President Museveni and the U.S. Agency for International Development (USAID) have signed a US\$ 14.3 million agreement that would make Uganda the regional information technology center. This includes the establishment of ten network academies within Uganda's university system that are partially funded by the Leland Initiative; a U.S. Government effort aimed at connecting African nations to the internet, helping Uganda position itself as a major player and regional center for the computer services market in Sub-Saharan Africa. South Africa is just about there at the university level, though a major effort is needed in townships and rural primary and secondary schools of the previously disadvantaged. South Africa has more than 400 call centers, many serving British "help lines" (e.g., insurance companies) employing 80,000 people.

Industrial Vocational Schools

In parallel with the industrialization of Sub-Saharan Africa to transform its raw products, vocational schools and apprenticeship programs must be developed so that there are trained Africans capable of being absorbed into these industries. For instance, the National Open Apprenticeship Scheme (NOAS) in Nigeria links education to the workplace through practical training under master craftsmen in industries such as docking and railways, training over 600,000 youth in over 80 trades since its inception in 1992; 400,000 of whom have started their own micro-enterprises.

14.2.1.2 Land and resource tenure

After education, giving ownership back to rural communities of their land, wildlife, fisheries, timber and mineral resources must take place if these resources

are to be used sustainably and are to play an important part in the development of African economies. This will allow the wealth from these resources to circulate, creating consumer societies. Until this takes place, any talk of democracy in Sub-Saharan Africa is a façade over-shadowed by a superficial process, one-man-one vote multi-party elections that will have little, if any, impact on the average person's life. It might be argued that Sub-Saharan Africa's first revolution was against colonialism. A second revolution is underway, the battle by communities to recapture land and associated resources from the governing elite in obtaining the right to benefit from their sustainable management (e.g., oil in the Niger Delta, Tuareg in Niger over uranium, Bushmen fighting to take back the Central Kalahari Game Reserve (CKGR), land claims in South Africa including within Kruger and other parks).

Empowering local communities to control their own land and resources, integrate their cultural values into resource/land use management plans and insuring that the wealth of rural Africa stays in rural Africa should help maximize the opportunity for reinvestment of this wealth in helping to create physically and mentally healthy children and adults, capable of learning and able to afford an education that will allow them to fit into a global society. These community resource companies should use a large portion of their profits to provide scholarships to local youth to study at tertiary universities, vocational and technical schools. This should help to take pressure off the rural resource base, as the majority of educated youth will opt for work in urban settings, assuming that conservation and development plans fit into a bigger plan for the subcontinent, which provides employment opportunities in urban settings.

It is hoped that empowerment of local people and integration of their culture into the management of resources on their lands will help provide a psychological boost to rural communities as they regain control over their destiny - as opposed

to being dominated by governments, NGOs, safari and tourism operators who have traditionally controlled access over and marketing of their resources, rewarding rural communities with a pittance for remaining “observers on the sidelines”. As “active players on the field”, this should help increase the feeling of security over controlling their lives, allowing them to determine the speed and degree to which they make a transition into modern society versus what they prefer to retain of their traditional lifestyles as a “cultural anchor”. This should minimize “escaping into the bottle” (alcoholism) that is so prevalent among transitioning traditional societies such as Bushmen, Pygmies and American Indians who have been expelled from their traditional world, but who are not adequately trained to fit into the new global society confronting them and who feel a loss of control over their destinies. This feeling of control over their lives, psychological well being and cultural anchor from ownership over “their” land, wildlife and other resources may be more important in the short-term than meat and money, rewards from conservation that CBNRM is so reliant on, but which fall short of significantly impacting heads of households. Certainly, it is the beginnings of grass roots bottom-up democracy.

It will be important to carefully assess the pros and cons of communal versus individual ownership of property and associated resources within the framework of rural African societies, given current resource/population ratios. Very often communal ownership over land and natural resources, within the African cultural context, may prove more sustainable than handing over individual ownership of resources. It is critical that, however it takes place, the privatization of land/resources retain not only economic/ecological integrity (e.g., minimal land size to avoid subdivision), but also socio-cultural integrity so often ignored in the past, in order to avoid continued resource mining and habitat degradation.

Strong consideration should also be given by governments to allow controlled access multiple-use of resources by communities in parks and reserves based upon zoning and a monitoring program to assure sustainability. For instance, facing the facts of many areas being surrounded by hard-edged poverty and uncontrolled poaching, Malawi some years ago began allowing controlled access to its parks and reserves for various resources as a means of assuring sustainable offtakes. Cameroon is beginning to allow rural residents access to its national parks to access certain natural resources. A Tshwane University graduate, managing the new 7,500 km² Quirimbas National Park, Cabo Delgado, Mozambique, rather than kick off the 100,000 residents, is recognizing traditional territories and working with the communities to sustainably use the resources within their areas while empowering them to stop access by outsiders. This also appears to be happening in Gabon's parks and reserves. This is in essence turning these areas into economic foci while going back to "Common Property Resource" management that will encourage people to become the eyes and ears of reserve managers. South Africa's Protected Areas act of 2003 may also allow such activities. The northern portion of Kruger National Park has already been given back to the Makuleke Community and declared a contractual park, allowing multiple-use, and there are still about 33 outstanding land claims against Kruger. Thus, the possibility of more multiple-use by the approximately 5 million poor living along its borders may be necessary in the long-term to justify the ecological integrity of the park to peripheral communities.

This may require IUCN to redefine a national park and/or realize that in the future, most protected areas will be classified in a lower order that allows multiple-use (e.g., Category VI of the IUCN), if such areas are to survive and at the same time have any meaning to local residents. These latter examples do not result in full devolution, but come very close and are a step in the right direction until communities are fully trained to manage these areas on their own.

Ultimately, such actions may be necessary to preserve biodiversity since this allows active management and monitoring, which clandestine poaching does not. In addition, as wildlife populations increase within hard-edged protected areas that do not allow for dispersal, the excess wildlife can be sustainably harvested before excessive grazing/browsing as a source of economic revenue and protein. Loss of biodiversity from excess habitat degradation as a result of over-grazing by wildlife or from the absence of fire and other forms of traditional human interventions (e.g., northern Kruger Park where forest is taking over and adversely impacting roan and sable populations), or even the closing up of forests in Bwindi, Uganda from elimination of the forest elephant - may require man to become part of the savanna ecology, as he has been since the beginning of time, only this time in a controlled manner to generate wealth at the level of households and community. Ultimately, the world must face up to reality on the ground that if parks and protected areas in Sub-Saharan Africa are to survive the 21st century they will have to serve the interested of the rural impoverished majority, as much if not more than the international elite minority. Land and resource tenure will be at the heart of this survival. One without the other, especially ownership of land without the ownership of the resources on the land may be of little value to rural people and may dissuade them from maintaining natural systems and associated biodiversity. Kenya is a good example, where group ranches own the land, but not the most valuable commodity, wildlife, and are opting for other land uses or selling off the land to be converted into commercial and traditional agriculture.

14.2.1.3 Agriculture

This assumes that tenure problems over land ownership are resolved.

Commercial Agriculture and Food Self-Sufficiency

With food poised to become the weapon of the future, one of the biggest threats to Sub-Saharan Africa is food sovereignty and economic independence. A key to escaping the current welfare relationship with the West is for Sub-Saharan Africa to achieve food self-sufficiency linked to food security. It is imperative that the 27% (≈ 600 million hectares) of Sub-Saharan Africa suitable for commercial and/or high potential, low input agriculture is identified that can help feed the urban masses. Where it is not already over-populated or already degraded, a continental-wide plan must be developed to assure that this land is immediately put into and maintained for commercial food production.

This may require joint-ventures between the private sector (e.g., commercial African farmers, multi-national agro-industry) and small farmers for technology exchange, along with the use of genetically modified (GM) crops, fertilizer/pesticides and other Green Revolution Technologies to achieve this goal on commercially viable soils. No different from the U.S. and EU, it may require Sub-Saharan Africa to subsidize its farmers to get the food production out of its soils needed to feed the continent.

This is extremely urgent in the case of Zimbabwe, a regional food basket whose commercial agricultural lands need to be put back into production as soon as possible. National, regional and continent-wide agricultural development plans are needed for the subcontinent that identify and map high potential soils and plan for the transfer of technologies needed to sustainably exploit them.

Development of Regional Markets

Sub-Saharan Africa must develop regional markets for its commercially produced grains and other products and no longer view subsidized handouts from Western donors as alternatives to Africa being able to feed itself.

Food Security

In some cases, cash crops (e.g., tobacco, cocoa, tea, coffee, etc.), especially if they are transformed in Africa – an imperative – may provide viable alternatives to food self-sufficiency through providing cash for food security, giving Africans in both urban and rural areas the ability to buy their food that in some cases may be cheaper to import than to produce in Sub-Saharan Africa (e.g., rice from Thailand).

Careful Use of Green Revolution Technologies

Irrigation and “Green Revolution” technologies may be of some help, but must be carefully integrated into national and regional plans to assure that they do not destroy traditional ecological and production systems, especially floodplains and estuaries (e.g., by dams associated with irrigation), and do not result in further soil degradation, especially nutrient mining, salinization and water logging. Environmental and socio-economic assessments must be accepted and mitigative measures implemented, not buried on a shelf as window dressing.

Where dams have destroyed floodplain ecosystems and estuaries (e.g., Senegal River Valley, Zambezi Delta) controlled flooding should continue or be strongly considered to bring these systems back into production. Water for irrigation will

have to fit into other needs, such as the partitioning of available water for industrial and potable needs, hydropower, navigation and in some cases, the sharing of this resource between countries in order to avoid “water wars” that could be looming on the horizon.

Research and Extension to Small-Scale Agriculture

It is likely that seed companies from America and Europe, beginning to establish themselves on the subcontinent, can provide much of the extension to commercial farmers, as is already occurring in South Africa.

There is a desperate need to support agricultural research and extension services to the estimated 70 million smallholder families in Sub-Saharan Africa. Given the disappearance of fallow periods, agricultural and land use intensification will be necessary to minimize encroachment on and assure preservation of nature reserves/parks, game reserves, wetlands, mangroves, grassbeds and coral reefs - the latter two affected by sedimentation and the misuse of pesticides and fertilizers in uncontrolled land-based runoff, and other fragile environments.

On the medium/low potential lands, constituting 47.5% of Sub-Saharan Africa, and the 25% that consists of desert/stEEP slopes that are inappropriate for agriculture, the cost of inputs such as commercial fertilizer, lime and pesticides versus increases in yields, may not be cost-effective. To have any chance of sustainably exploiting these marginal areas, research is required into developing appropriate and cost-effective technologies. This includes but is not limited to small-scale irrigation, use of locally manufactured phosphate fertilizers and other soil conservation technologies that link traditional knowledge to modern concepts, such as improved composting, improved wetlands management (multiple-use of floodplains), minimum tillage, appropriate mechanization, improved terracing,

drip irrigation, mini-barrages, etc. Lower cost, Low External Input (LEI) technologies, such as improved fallow agriculture through integrated nutrient management (INM), may be required in such cases. There is a need for agricultural extension agents and anthropologists to work with African elders to capture traditional knowledge about INM (e.g., traditional use of fallow, legumes, crop rotation, green and animal manure, inter-cropping, etc.), vegetative indicators of soil fertility and how these practices link to the sustainable management of other natural resources (e.g., forests and wildlife), both technically and socially.

Research needs to be undertaken into enhancing production of traditional soil and climate adapted “lost grains of Africa” such as Pearl Millet (*Pennisetum glaucum*), Fonio (*Digitaria exilis*), African Rice (*Oryza glaberrina*), Sorghum (*Sorghum bicolor*) and Tef (*Eragrostis tef*). This can be through LIE/INM technologies adapted to improve yields and/or development of improved seed varieties. This research can occur at the very Sub-Saharan African universities training Africans, thereby taking pressure off the limited resources in agricultural ministries. Ideally, extension should be through Ministries of Agriculture, linked to these universities, employing their graduates so that linkages between research and extension are maintained. As noted, it can also be linked to vocational programs in primary and secondary schools located in rural farming areas.

Infrastructure

It is common knowledge that a large portion of Sub-Saharan Africa’s agricultural production is lost to spoilage and pests due to improper storage facilities. Improper storage in the highly humid subcontinent is also a breeding ground for molds and the production of carcinogenic aflatoxins that have a major impact on health. Some say that 40% of the productivity lost to diseases in developing

countries, including Sub-Saharan African is due to diseases exacerbated by aflatoxins, with aflatoxins contaminated diets being linked to liver cancer.

Sub-Saharan Africa has the lowest density of road networks in the world, a mean density of 0.86 km/thousand head of population. Improved road networks are required to make transport of both inputs and produce cost-effective.

Roads are among the most important part of a country's annual budget to maintain and are expensive to build. Falling into more debt and then not being able to maintain this infrastructure is a return to the past. Sub-Saharan Africa must start developing its economies and, in turn, phase in the infrastructure through its tax base. Until an adequate tax base is developed to build and maintain hardtop roads, it is likely that other than the main arteries, a program of regular grading may be more cost effective.

Land Reform

Land reform must be de-politicized in Southern Africa to assure that commercially viable agricultural lands can continue to feed the region. Politicized land reform, as in Zimbabwe, disenfranchises white farmers without transferring commercial technologies, setting a dangerous precedent that risks the loss of both political and food sovereignty at regional and national levels.

It must be undertaken in South Africa and Namibia with caution. The agro-industrial complex is an important base of the economy in assuring political autonomy and healthy people. If this sector collapses, it could result in South Africa's and Namibia's economies heading into a tail spin. South Africa's Agricultural Black Economic Empowerment (AgriBEE) document needs to be undertaken in a partnership between government and the private sector to assure

an orderly transition, while maintaining food production for the region. The mentoring program discussed above should play an important role in assuring the transfer of commercial farming technology to the black community. Sub-Saharan Africa cannot afford another Zimbabwe.

As noted above, Africans must be trained to run and operate these lands, even if they are community-owned instead of individually owned. Depending on each agro-ecological zone, minimal farm sizes must be established to assure that both the ecological and economic integrity of these units are maintained.

14.2.1.4 Sustainable use of other natural resources

This assumes that tenure problems over land and resource ownership are resolved.

Linking the concept of food self-sufficiency to food security, as discussed, recognizes that in the majority of Sub-Saharan Africa, its savanna's will never be a breadbasket for the subcontinent due to physical and chemical limitations of the soils and to climate. Where feasible, Africans must take advantage of the best land uses in these savannas from wildlife, forestry, fisheries and pastoralism to generate income that can be used to buy food. Someone must provide training to rural African's to sustainably manage these resources. The same can be said about tropical lowland forests and afromontane forest biomes where logging, bushmeat, wild medicines, fishing, honey, gorilla/primate viewing, backpacking, mountain climbing and safari hunting can generate significant income for rural communities.

Recognition of Traditional Resource Management Systems and Their Integration into Modern “Western” Intensive Management

Unless there is a paradigm shift towards a “utilitarian conservation” that meets the needs of rural Africans whose lives are still closely tied to these resources, neither they, nor wildlife, nor the natural systems on which they both depend have much of a future. Ultimately, this approach will result in high biodiversity through incentives for rural Africans to live sustainably from the multitude of resources available to them in “their” protected areas, as has been the tradition in the past. Thus, the future of Africa’s mega-fauna is in the hands of the rural people co-existing with this wildlife. If the policies are correct, they will become good conservationists as in the past, but if the status quo remains, neither the NGO’s nor game/park departments, nor international bureaucratic controls, such as CITES, will stop wildlife’s demise as rural inhabitants opt for other land uses and/or in a survival mode use wildlife as a short-term resource.

It is recommended here that formal conservation interventions in the 21st century should take advantage of already-existing informal traditional management and control systems to ensure maximum local participation and success.

Furthermore, there is a need for more scientific evaluation of the traditional beliefs, and practices, a better understanding of their role in conservation and resource management, provision for legal backing of these traditional management systems and a need for enforcement of these traditions to ensure continuous biodiversity conservation.

As increasing population pressures require more intensive management of wildlife, where hunting guilds exist, strong consideration should be given to strengthening these institutions, through which all local hunters would be required

to pass in order to receive proper training and to control access to the resource. This may be likened to someone in Europe or North America being required to be part of a hunting club as a means of buying into the right to access certain properties and their wildlife, or as is currently occurring in South Africa, being a member of a hunting or shooting association as a prerequisite to owning a firearm.

Selected youth from these guilds would be hand-picked, sent off for mid-level (e.g., Mweka and Garoua) or tertiary (university) training, returning to work with the guilds to take over and manage game reserves and parks as centers of both biodiversity and economy, something centralized governments have for the most part proven incapable of accomplishing. This process is currently underway in the Comoé-Leraba Game Reserve of southern Burkina Faso. This would apply for traditional forestry, fisheries, pasture and other resource management structures and systems – that is a blend of traditional systems with modern concepts, providing a cultural anchor, “building the churches of conservation on the bases of the traditional pyramids” that was so successful in the adoption of Catholicism introduced by Spain to the Aztecs, Mayans and Incas in the New World.

Community-owned Natural Resource Businesses

The best managers of natural resources are those whose lives depend on the resources for survival, not NGOs or government bureaucrats isolated in capitals or regional towns, nor the private sector, all of whom have tended to live off the wealth of rural communities. There is an increasing need through decentralization to legalize ownership and control over land and resources by communities, while these other stakeholders provide technical backstopping and marketing until communities have developed their own trained members and clientele.

Rural Africans need support in starting their own “community-owned” companies (e.g., photographic safaris, hunting safaris, commercial and sportfishing companies, Scuba diving operations, agricultural companies and transformation industries, logging and timber transformation companies, etc.) that fit within their socio-cultural framework and which assures that the majority of net profits stay within rural Africa, serving as a catalyst for development. Creating transparent external auditing will help overcome the chronic disappearance of funds so common in CBNRM and allow the communities to hold selected decision makers accountable for their actions. A major challenge is getting communally oriented cultures to make shareholder-owned companies work to the benefit of the shareholders as opposed to a few elite!

Where needing Western technologies and marketing skills, communities can joint venture with foreign entities, but being educated as recommended, communities will clearly understand the value of their natural resources and what it will take to sustainably manage them. In the interim, there is a role for NGO watchdogs/advisors to assure equity in such ventures, as long as the NGO's do not make themselves indispensable middlemen. Thus, communities will be able to assure an equitable share of profits and that resources are harvested sustainably so as to be available for future generations. Any such joint venture must include on-the-job and formal training with a goal that the company is locally run and operated over a 15-20 year time frame. Exposure of rural Africans to the overseas market is critical to their learning the business and being able to cut out the middleman.

As much as possible, a management and land use plan should allow for multiple resource use (e.g., safari hunting, traditional hunting, charcoal making, timber harvesting, fishing, honey collection, other wild food collection, thatch grass collection, wild medicines harvesting, etc.) from these natural areas as a means of

maximizing both economic and cultural benefits to community stakeholders/entrepreneurs, as well as to get as many benefits as widely distributed as possible at the household level. The White Mountain Apache program might be looked at as an adaptable model for Sub-Saharan Africa.

These “community-owned companies” can pay taxes like any private sector company. The shareholders of the companies, the heads of households, can also pay taxes if income is distributed at this level. This will negate the felt need by African governments to take the value of these resources directly (e.g., trophy and concession fees), a major reason that rural Africans remain in a perpetual state of poverty on the richest continent in the world. This implies legal title deeds to both land and the resources on this land.

Cultural and Economic Constraints

A caveat and a constraint to progress is that the majority of rural Africans, due to the population explosion and politics, both pre and post-colonial in the 20th century, are at or near the lowest level of Maslow’s Hierarchy of human needs, “survival”, and thus are prepared to do anything in order to move up this pyramid. Westerners, who are at the top of this pyramid, may be expecting too much to hope that individual’s in Africa will care about the greater good of their fellow man or biodiversity when they are trying to survive, while having to drag along the extended family that acts as a ball and chain attached to their ankle, continually pulling them down economically. This trait is strongly linked to the patronage system and clientelism that Westerners perceive as corruption, but which Africans consider taking care of their extended families, ethnic and religious groups to whom they relate and maintain their power base more so than nationhood. This often results in a clash of cultures when the two groups, the West and Africa, try to conduct trade and commerce, or establish Western rule of

law. This problem, which must be overcome, permeates at all levels of society from the capital down to the village level.

Until Sub-Saharan Africa develops a majority middleclass that permits individuals to free themselves of this cultural bondage, the West is naïve to think that the subcontinent will develop a “modern conservation” ethic, or those in control of power, resources or money will be altruistic, regardless of the level of decentralization. Transparent accounting systems can help overcome this problem technically, but only major strides in education and economic development can overcome this constraint. Ultimately, the blame must not be placed entirely on the extended family/ethnic group. A large part of the blame and most of the solution lies in governments creating appropriate policies that result in growing economies, adequate employment and the circulation of wealth through the majority, spawning a consumer society and taking the pressures off individuals to support the massive numbers of unemployed. It is likely that not until the majority of one’s extended family has work opportunities, will this constraint be overcome.

Thus, conservation and development in Sub-Saharan Africa is confronted with major challenges to overcome, the biggest being for Africans to find a way of integrating their cultural values into and overcoming cultural constraints in order to successfully integrate into Western systems and norms of business, governance and resource management. Africans rapidly pick up Western technologies, so this is not really a major constraint, but a question of exposure and opportunity (e.g., formal educational opportunities and on-the-job apprenticeship programs). The West can help overcome technological constraints, while Africa and Africans must overcome the cultural ones.

Development of Long-Term Resource Monitoring Programs to Assure Sustainability

Once land and other natural resources are returned to their rightful owners, rural communities, who are educated in the sustainable management of soils, wildlife, fisheries, timber, etc., in Sub-Saharan Africa with modern-day internet connections can establish collaborative monitoring programs between themselves, universities, governments and the private sector to assure that these natural resources serve as sustainable catalysts for development.

14.2.1.5 Industrialization and transformation in Sub-Saharan Africa

We should not fool ourselves into thinking that these improvements in CBNRM will create a middleclass in Sub-Saharan Africa by themselves due to the low resource/population ratios. In fact, conservation linked to rural development on its own will fail to conserve biodiversity in Sub-Saharan Africa. With a direct relationship between human population growth and habitat/wildlife decline, conservation in the 21st century must fit into a bigger plan for development of the subcontinent if it is to succeed in saving the last great assemblages of Pleistocene mega-fauna and if it is to improve the lives of Africans.

Urbanization and Industrialization

Among other things, to be successful, conservation must be linked to providing alternative livelihoods in urban settings by taking advantage of youth escaping the over-populated and degraded rural areas. This will have a tremendous beneficial impact in alleviating the current population pressures mining rural resources on the subcontinent. Sub-Saharan Africa must go through the same urbanization,

industrialization and information technology (IT) evolution/revolution experienced by Europe and North America in the 20th century, where, for instance, less than 2% of the people in America feed the majority living in urban centers.

In addition to improved education and healthcare systems, this will require transforming Africa's raw products on the continent, such as:

- Wildlife through taxidermy;
- Timber transformed into veneer, furniture and other byproducts;
- Cocoa, coffee tea, etc. processed and packaged into final products;
- Using the comparative advantage of Africa to grow cotton (with fertilizer to avoid nutrient mining of the soils) and other crops, as well as to employ many people to produce end products such as clothes, roasted coffee, winter vegetables, canned fruit and vegetables, cut flowers, etc. for regional and international consumption; and
- Transform minerals such as steel, aluminum, oil, gold, COLTAN, titanium, etc. into end products such as cars, car parts, appliances, computers and microchips.

Currently, South Africa is the only industrialized country on the subcontinent capable of taking advantage of a gradual opening up of trade with the West for manufacturing cars, car parts, arms, clothes, wines and jewelry, all essentially a product of isolation under Apartheid. Product dumping by China, especially clothes, is jeopardizing this advantage in Lesotho and South Africa, among others.

Sub-Saharan Africa must understand that it has the unique resources desired by the West. It must start calling the shots, requiring industrialization and transformation on the continent prior to sale of its products to the West. In

essence, this is already happening to a large degree in South Africa, locally called “beneficiation”, and its expansion must continue.

However, this cannot be at the expense of the worker and environment. Worker safety and minimal wages that help create a “blue collar” middleclass based on local cost of living, is imperative. Since the cost of living or “purchasing parity” is lower in many developing countries, it is likely that lower wages can be paid compared to North America/Europe, that will allow people to live middleclass lifestyles and thus, for private investors to still make a profit compared to their home country. Where this is not the case, but the West is in dire need of the subcontinent’s resources (e.g., COLTAN, tropical wood products, extracts for medicine and hunting trophies), Africa has the upper hand and can negotiate the transformation of these products, wages and environmental controls. Meeting the same water quality and air standards as in Europe and North America, in both the working and natural environment, are also mandatory. This includes using technologies appropriately (e.g., dams, power plants, municipal and industrial waste treatment and disposal, etc.), including mitigation of adverse environmental and socio-economic impacts as part of the cost for investment and/or the recurring costs of doing business. This will require careful planning and possibly decentralized industrialization that avoids the creation of mega-cities so that no one area’s resources are overly stressed, such as water, air, transport infrastructure, health and educational services.

Going Local Where Necessary

It is not economically viable for every country on the subcontinent to manufacture all of the products it needs, such as automobiles, or to produce all of its transformed foods. As a means of overcoming economies of scale, attempts must be made to develop not only international markets, but regional markets for

manufactured products, such as through the regional organizations of the Southern African Community (SADC), the Southern African Customs Union (SACU) comprised of South Africa, Lesotho, Swaziland, Namibia and Botswana, the Common Market of Eastern and Southern African States (COMESA), the East African Common Market and the Economic Community of West African States (ECOWAS). SADC countries are in the process of agreeing to allow the free flow of goods and workers across borders. This is a move in the right direction in promoting regional trade.

Just as in the USA and Europe, there may be certain local industries, which are labor intensive that need protection at least until they are competitive. Similar to the EU and U.S. for the year 1998, South Africa highly subsidized certain agricultural commodities as a means of maintaining its food production, including wheat with a percentage Producer Subsidy Equivalent/Producer Support Estimate (PSE)/(%PSE) of 19.44, sugar/39.55, mutton/49.28, wool/14.97, dairy/20.92, as well as beef and veal/21.20, indicating the direct and indirect level of support to farmers. Based on a 1996 census, 814,000 people were employed in South Africa's agriculture/hunting/forestry/fishing sector, out of an estimated national workforce of 9.1 million, or approximately 9% of South Africa's workforce. Keeping this important sector viable may require further protection, such as tariffs on imported products as maize that can be sold at artificially low prices to South Africa as a result of subsidies in the U.S. and/or other direct subsidies (e.g., fertilizers and pesticides) to these farmers, as in America and Europe, to help them compete with an unfair market. The rest of Sub-Saharan Africa must follow in South Africa's footsteps.

Local does not mean walling off the outside world. It means nurturing businesses that use local resources sustainably, that employ local workers at decent wages and that serve primarily local/regional consumers. It means becoming more self-

sufficient and less dependent on imports. The EU and America already practice this so why not Sub-Saharan Africa not. Once globally competitive, such as South Africa's car parts industry, markets can be opened to help them expand as part of trade agreements. This helped spawn the "Asian Miracle", along with technologies obtained from foreign investment (FDI).

Appropriate Use of Western Technologies and Environmental Assessment Procedures

South Africa is the only country in Sub-Saharan Africa, which has very serious environmental assessment procedures that are required prior to allowing major development activities. African governments must adopt standardized procedures and must attempt to assure that the placement of technologies, such as boreholes, dams and irrigation systems, do more good than harm and that rural communities benefit from their placement, including receiving appropriate training to be able to benefit from these technologies. Standardized procedures and norms on the subcontinent will prevent foreign investors attempting to force a country to drop its standards by threatening investment in a neighboring country with lower standards. This levels the playing field.

The Sahelian Wetlands Expert Group (SAWEG), linked to the IUCN, can help provide expertise to assure that artificial flooding becomes part of dam management in order to assure that these important wetlands are maintained once hydrological regimes are modified by dams.

Small farmers need training in use of appropriate irrigation technologies, drainage systems, possibly locally produced and cost-effective fertilizers, soil treatment and soil testing for parameters such as acidity, nutrients, salinization, etc. to

assure sustainable agricultural production and to prevent adverse environmental impacts.

Pastoralist communities must be trained to open and close boreholes as a means of controlling livestock and wildlife movements in order to assure that pasture production is maintained as a means of avoiding the ravages of desertification.

With regard to coastal development, especially along Africa's east coast in the Western Indian Ocean, key coral reefs need to be identified and classified as to their current health, such as through the Coral Reef Degradation in the Indian Ocean (CORDIO) program. More importantly, coastal tourism developers should be required to undertake environmental assessments that look at appropriate sewage and solid waste disposal programs, and that assure critical habitat such as mangroves, grassbeds, turtle nesting beaches and corals reefs are minimally impacted by development activities. This will require a land use plan for the area and investors pooling their money to pay construction and maintenance for "Common Property" sewage and solid waste treatment and disposal systems, since it is likely that no one developer can afford the required processes. Where the littoral zone is narrow and/or offshore currents are appropriate, "the solution to pollution is dilution." With appropriate modeling and oceanographic studies; once bed nights reach a certain threshold, preliminary treatment combined with an offshore and/or deepwater outfall will likely be the most cost-effective long-term means of protecting near-shore environments from sewage for both ecological and public health.

Initially, in the early years, until development surpasses the carrying capacity of the system to absorb the pollution without degrading, especially the fragile coral reefs, lower cost technologies may initially be employed (septic systems, secondary package plants – ideally with landbased effluent disposal).

Environmental monitoring, especially of water quality and reef health (e.g., percent algal cover, percent live/dead coral) will be required so that adequate time can be anticipated after a certain level of tourism development (e.g., indicated by increased nutrient levels, algal/coral ratios, and/or percentage of dead coral), where after, high cost technologies will be necessary to maintain the integrity of the coastal ecosystem. Regardless, as a cost of doing business, developers should be required to establish long-term coral reef and water quality monitoring stations as a means of assuring that mitigative action, if necessary, can be taken before irreversible adverse impacts occur from tourism. Such procedures need to be adopted by NEPAD's "Regional Project on Shoreline Protection through Integrated Coastal Area Management".

14.2.2 Policy Changes and Programs by the West to Support Conservation and Development in Sub-Saharan Africa

Capitalism has been based on maximizing profits at all costs, creating win-lose relationships with the rest of the world. Until now, unfettered Western Capitalism, other than for a few Western countries (e.g., America and Europe), has failed the developing world every bit as badly as communism. The New Partnership for Africa's Development (NEPAD) asks both Western governments and their private sector, in return for appropriate policies and good governance, to turn from exploitation for short-term gains to investment in a win-win relationship that in a global society will give African's and their natural resources, especially their unique mega-fauna, a hope for the future.

14.2.2.1 Helping Sub-Saharan Africa industrialize

There is a crying need for the West to export its industrial and IT technologies to the remainder of Sub-Saharan Africa, along with training Africans to work in

these industries so that the rest of the subcontinent can take advantage of the West increasingly opening up to trade in transformed products from Africa.

This will require a win-win relationship with the West in which they introduce their technologies through the Western private sector to help Africa industrialize in carefully selected urban centers that can take advantage of the regional populace without placing undue pressure on local resources such as water, forests and wildlife. This will require careful planning at all levels.

Foreign aid might be of value by providing grants or low interest loans for the Western private sector to invest in various African countries, possibly through a “Sub-Saharan Africa Marshall Plan”. However, the money for this plan must be spent in Africa on infrastructure and on Africans, especially health and education, and not just recycled to Western consulting firms, experts and NGOs, as in the past.

The following agreements can help open up transformation of Africa’s raw products in Africa and their trade with the West: 1) The New Partnership for Africa’s Development (NEPAD), 2) The African Growth and Opportunity Act (AGOA) and 3) The European Union (EU)’s (“Everything but Arms (EBA)”) initiative of duty-free and quota-free entry for all products (except arms) in favor of Least/Less Developed Countries (LDCs), 34 of which are African countries. Sub-Saharan Africa must still compete against various subsidies that protect American and European farmers against outside competition, and product dumping by China that threatens economies in both the developing and developed world. Regardless of trade agreements, good governance, transparent investment incentives (e.g., open currency exchange and reasonable employment laws that protect the employer as much as the employee), a free press, and assuring appropriate democratic processes and civil stability will be required for Sub-Saharan Africa to receive significant Foreign Direct Investment (FDI).

Some might ask if it is in the economic interest of the West to help transform products that would otherwise stimulate their and not Sub-Saharan Africa's economies. Much of the burden of bringing industrialization and IT to the rest of the subcontinent may fall on the shoulders of South Africa. In addition to altruistic motives, this may also be necessary in order to avoid the rest of Sub-Saharan Africa seeking shelter on South Africa's door step, as is currently the case, with all of the concomitant ramifications such as crime and pressure on health, educational, housing, roads and other services. At this time, South Africa must make sure that it does not become another imperial/colonial power exploiting cheap labor and negligible environmental controls as it introduces these technologies to the rest of the subcontinent.

14.2.2.2 Dropping trade barriers and subsidies

The West cannot be allowed to put up "smoke and mirrors" in which "markets are opened", but tariffs and other trade barriers, subsidies, artificially weakened currencies and other constraints keep them closed and non-competitive. Dumping subsidized food and other products in Africa, often of inferior quality (e.g., maize with a high moisture content with the risk of aflatoxins developing) and other Western approaches (e.g., neoliberal structural adjustment policies of the Washington Consensus) that keep Africa marginalized, must be halted. The World Trade Organization (WTO) may serve as the negotiating body for this process. The African Union and regional Sub-Saharan organizations should play a major role in negotiating these regulations and controls. There must be equality on the playing field of trade and commerce; two-way fair-trade, not one-way unfair "free" trade.

14.2.2.3 "Publish what you pay", creating transparency with what happens to Africa's wealth

Launched in 2002, "The Publish What You Pay" coalition of more than 190 Northern and Southern NGOs is calling for legislation to require extractive

companies to disclose their payments to all governments. This would help citizens in resource-rich-but-poor countries, as well as the global community, to hold African governments accountable over the management of revenues. Some say stock market regulators could require such disclosure by Western oil, gas and mining companies in order to be listed on the stock exchange and financial markets. This could potentially occur through the World Trade Organization (WTO) or the United Nations (UN). Some may perceive this recommendation as patronizing and condescending to Africans and African governments. However, if we are open and honest, until there is a majority educated African middleclass demanding the creation of transparent and accountable systems in the business place and in governments, as well as rule of law to overcome the above-mentioned cultural constraints, it is the responsibility of a global community in this modern age of information and communication to hold both multi-national and national corporate leaders and governments accountable for reinvesting the wealth of Sub-Saharan Africa back into its people and infrastructure. As this income is invested in the health and education of Africans, citizens of these countries will demand this same transparency and accountability from their leaders and such programs can fall away.

Decentralizing resource and land tenure to the local level should bring accountability down to the local level, but will still require establishment of transparent accounting systems and democratic decision making processes that fit into the socio-cultural framework at the local level. Once again, installation of accounting systems is a simple technological process, while implementation of this technology and using it in a functional transparent system is confronted with cultural constraints (e.g., a government appointed non-representative chief and a few cronies feeling they have the right to use economic benefits as they wish without asking permission of their constituency) or possible cultural strengths requiring traditional democratic meetings such as “indaba” in the Zulu culture or

“kgotla” of the Tswana culture. Once again, Africans must integrate their traditional systems of governance and culture with these modern decision-making tools and make them part of the solution as opposed to part of the problem.

14.2.2.4 Areas where foreign aid can make a difference in Sub-Saharan Africa – health and education

Education and health (e.g., HIV/AIDS, potable water supplies, etc.) are two priority areas where an increase in aid is desperately needed and could make an enormous difference to the lives of millions of people in Africa. Africa’s education crisis is stunting its development. Education has the potential to be a “stealth weapon” in the war against poverty. It can open doors to better health, increased income and independence. Investment in education and health will result in declining birth rates and declining rates of HIV/AIDS. It will produce productive adults able to fit into a global economy as envisioned by NEPAD. Education and the creation of a middleclass, along with urbanization, will help rid ethnic hatred often derived from competing for scarce resources, while retaining cultural pride, as well as breakdown the suffocating aspects of the extended family, while retaining the positive moral and cultural beliefs, and kin ties. It will help bring about democracy, as awareness through education will demand accountability from leaders. The only other real need is food relief, until the subcontinent combines food self-sufficiency that is improved food production in Sub-Saharan Africa, with food security that is through industrialization/IT employing people who can buy their food, either locally produced or imported. Food relief must only be used in emergency situations and not become a “crutch” that allows the subcontinent to put off the inevitable, the need to stand on its own two feet, or a mechanism that discourages farmers from farming.

14.3 ROLE OF WATCHDOG NGOS

Human rights groups, (e.g., Forest Monitor, International Crisis Group (ICG), Human Rights Watch, International Rivers Network (IRN), OXFAM, Survival International, World Rainforest Movement, etc.) must continue monitoring people displaced by large dams, either within inundation zones or from modification of downstream floodplain ecosystems; to traditional fishing communities impacted by coastal development and people adversely impacted from the continual creation of parks and protected areas that fail to truly integrate peripheral communities into their management and the sustainable use of the resources found within them.

Watchdog groups such as the International Rivers Network (IRN) and the World Commission on Dams (WCD) – now housed at UNEP/Nairobi - must keep countries, donors and the private sector honest, assuring that mitigative actions recommended by environmental assessments are implemented and that alternatives to large dams (e.g., alternative energy, small-scale hydropower, run-of-the-river hydropower, min-barrages and micro-irrigation) are seriously considered.

Coastal watchdogs, such as Global Coral Reef Alliance and Reefbase, need to speak out when unsustainable development is undertaken that may degrade these fragile systems.

Groups such as the Forest Stewardship Council (FSC) and their forest certification *Société General de Surveillance* (SGS) QUALIFOR program need to move into Central Africa to assure the logging of Africa's tropical lowland forests, mostly by European companies, is sustainable from the standpoint of timber harvests, associated wildlife and local cultures. They need to be teamed up

with human rights groups that help to assure what is happening within these forests, in what appears to be possible collusion between international timber companies, some conservation NGOs, western donors and governments, is not destroying the lives of traditional societies.

If necessary, consideration must be given to charging key stakeholders with human rights violations where the future of rural small-scale societies may be in jeopardy because of inappropriate conservation and exploitation schemes. The bottom line cannot just be maximization of profits when biodiversity and the lives of people are concerned.

14.4 CONCLUDING REMARKS

The Pulitzer Prize-winning author and professor of geography at the University of California, Los Angeles, (UCLA), Jared Diamond, contends that the collapse of past civilizations (e.g., Anastazi of Arizona; Mayan of Guatemala and Mexico, etc.) are linked to eight areas that resulted in major environmental degradation and eventually their collapse (Diamond, 2005) including: deforestation and habitat degradation, soil problems (erosion, salinization and soil fertility losses), water management problems, over-hunting, over-fishing, effects of introduced species on native species, human population growth and increased per capita impact of people.

In the 21st century, Diamond (2005) adds an additional four environmental problems jeopardizing modern civilization: human/natural-caused climate change (e.g., e.g. desertification, mass coral mortality from ocean warming, loss of wildlife habitat), build-up of toxic chemicals, energy shortages and full utilization of the Earth's photosynthetic capacity.

However, a society has never collapsed solely from environmental damage. Environmental damage and three additional factors are identified that may significantly contribute to a civilization's collapse (Diamond, 2005): hostile neighbors, friendly/unfriendly trade partners and society's response to its environmental problems;

Diamond (2005) raises concern that with globalization, modern businesses are among the most environmentally destructive forces of the 21st century, but at the same time makes it impossible for a society to collapse in isolation, since such events can be viewed on CNN or BBC news broadcasts. The danger is raised that any society in turmoil today, no matter how remote, can cause trouble for prosperous societies on other continents (e.g., cutting off supplies of oil in the Niger Delta or other resources/products necessary to maintain Western economies, and generating terrorists out of hopelessness and despair from youth living in rogue nations or countries with non-representative dysfunctional governments). Diamond (2005) alleges that for the first time in the history of mankind, we face a risk of global decline.

This book demonstrates that Sub-Saharan Africa is faced with the majority of the above environmental issues/indices, including over-population, soil exhaustion, deforestation, desertification, over-fishing, over-hunting, major loss of habitat and biodiversity, water scarcity and the possibility of water wars, along with related factors:

- Declining or no agricultural fallow;
- Declining agricultural yields (kg/ha) and/or maintained short-term yields through intensification and mining of soils or extensification into marginal areas;
- Declining land per capita available for agriculture;

- Wars fought over land/resource scarcity (e.g., Rwanda, Burundi, the Ivory Coast; central Nigeria; Darfur, Sudan) - friction resulting from small farmers encroaching in traditional pastoral environments;
- Hard-edged pockets of biodiversity (parks and hunting blocks, private commercial ranches) surrounded by a sea of poverty and slowly being encroached upon;
- Western solutions to conservation that continue compressing Africans onto unsustainable land masses in the name of biodiversity, accelerating rather than ameliorating environmental degradation; resulting in degradation first in the compressed areas and next through invasion of so-called protected areas by alienated rural communities;
- Linked to the above point, hunting concessions and ecotourism concessions being leased out at a pittance to foreigners/outsiders, often making access to these areas either unaffordable and/or illegal for Africans to frequent, with much of the income derived mostly from foreign clients staying in the capital or offshore in overseas bank accounts;
- Hostile neighbors, resulting in Sub-Saharan Africa's first "World War" in the Congo Basin over access to abundant resources;
- Massive immigration by Sub-Saharan Africans across borders to escape this environmental degradation to coastal African cities and centers of wealth, such as South Africa, Europe and the USA; and
- Unfriendly trade relationships as Western powers take on the behavior of a predator, hungry for scarcer global resources (e.g., oil and COLTAN) they need for survival; regardless of the consequences to the countries and people living among these resources;
 - Non-representative governments – often put into power and propped-up by the West to meet the needs of the West and to the benefit of a few multi-nationals and political elite;

- Foreign aid and trade regulations from supposedly friendly partners who use these as tools to continue plundering Sub-Saharan Africa's raw resources; and
- Proxy wars using African troops by Western super powers for ideological reasons and/or control over Africa's riches to the detriment of millions of people.

This book concludes that if Sub-Saharan Africa fails to address these human dimensions of conservation and development, and continues along present trends in 50 years time, if not sooner, we could be talking not about the collapse of a civilization, but of an entire subcontinent.

Africa and Africans must begin taking control over their resources, their lives and their destinies, which since colonial days up until present, are controlled by outside forces that have placed their vested interests, and not Africa's, as a priority. Africa and Africans must jettison the shackles of economic, political and psychological slavery, from both within its borders and from outside. Will Africa "choose to fail or succeed"? Will the sun rise or set over this ecologically and culturally unique and resource rich continent? Africans must make this decision and the rest of the world will follow them. Currently, Africa is following.

Finally, concerning the future of modern man, there is an interesting comparison to be made between Western civilization's conspicuous consumption, and the beaver (*Castor canadensis*). The beaver's teeth never stop growing. It must continually chew down trees to grind back its incisors so that they do not keep the mouth from closing and the beaver starving to death. When beavers overpopulate an area, their ability to expand, as a population is dependent upon available habitat at a local level, often placing their populations into boom or bust cycles. Western civilizations' economies and now that of China, as they run low on food

(e.g., oil and other resources) expand their consumption to other continents (e.g., Sub-Saharan Africa). While beavers have no choice, chewing to live, Western civilization should have the foresight to realize the unsustainability of its actions (Stouder, 2007) and the risk to our Planet if this continues.

CONCLUDING REMARKS

Diamond, J. 2005. Collapse. How societies choose to fail or succeed. Viking Penguin: New York. 575p.

CBNRM	Community Based Natural Resource Management
CBC	Community-Based Conservation
CBD	Convention on Biological Diversity
CBO	Community Based Organization
CBO	Congressional Budget Office
CC	Community Conservation

CCWA	Caribbean Water and Wastewater Association
CDV	Canine Distemper Virus
CE	Christian Era
CEC	Commission for Environmental Cooperation, North America
CEDC	<i>Centre Des Etudes de L'Environnement et de Développement du Cameroun</i> , the Center for Environmental and Development Studies in Cameroon, Maroua, Cameroon
CEDEAO	<i>Communaute Economique des Etats d'Afrique de l'Ouest</i> – ECOWAS in English
CEEC	Central and Eastern European Countries
CEGs	Community Escort Guides
CEII	Citizens Energy International, Inc.
CEO	Chief Executive Officer
CFA	<i>Franc de la Communauté Financière Africaine</i> , Francophone Africa Currency = FCFA, at time 50 CFA/1 French Franc (FF) until 1994 when it was devalued at 100 CFA/1 French Franc, now fixed to the EURO at 655.957 FCFA/1 EURO
CFAO	<i>Compagnie Francaise de L'Afrique de l'Ouest</i>
CFCs	Chlorofluorocarbons including CFC-12 (CCl_2F_2) and CFC-11 (CCl_3F)
CFSO	<i>Compagnie Forestière de la Sangha-Oubangui</i>
CGIAR	Consultative Group on International Agricultural Research
CH ₄	Methane
CHA	Controlled Hunting Area
CI	Conservation International
CIA	Central Intelligence Agency of the United States
CIAT	<i>Centro International de Agricultura Tropical</i> /International Centre Tropical Agriculture
CIB	<i>Congolaise Industrielle des Bois</i>
CIDA	Canadian International Development Agency
CILSS	Permanent Interstate Committee for Drought Reduction in the Sahel
CJTF	Combined Joint Task Force-Horn of Africa

CIRAD	<i>Centre de Cooperation Internationale En Recherche Agronomique et Developpement</i> , old ORSTOM
CITES	Convention on International Trade in Endangered Species
CKGR	Central Kalahari Game Reserve
CM	Collaborative (or Co-) Management
cm	centimeter
CMA	Community Management Area (Botswana)
CN	Cyanide
CNDP	National Congress for the Defense of the People CNDP
CNN	Cable News Network, a television and news web broadcasting company, a Time Warner Company
CNPC	China National Petroleum Company
CO ₂	Carbon Dioxide
COBRA	Conservation of Biosphere Reserve Areas, Kenya Wildlife Service, USAID Funded
COLTAN	Columbite-Tantalite, used in making microchips, cell phones and computers
COMESA	Common Market for East and Southern Africa
COMIEX	DRC Mining Company
COMINFAC	Conference of Minister in Charge of Forestry in Central Africa
COP	Conference of Parties, CITES
CORAF	<i>Conseil Ouest et Centre Africain pour la Recherche et Développement</i> = WECARD in English
CORDIO	Coral Reef Degradation in the Indian Ocean
CORE	Conservation of Resources through Enterprise, sequel to COBRA Kenya Wildlife Service, USAID funded
COSLEG	Mining company in DRC linked to Zimbabwe Defense Forces
<i>Cote d'Ivoire</i>	Ivory Coast
COVAREF	<i>Comité de Valorization des Resources Fauniques</i> (Committee for Valorization of Natural Resources - Cameroon)

CPA	Communal Property Association, South Africa
CPA	Comprehensive Peace Agreement between northern and southern Sudan
CPI	Community Protected Area Institution
CPI	Corruption Perceptions Index
CPR	Common Property Resource
CRBs	Community Resource Boards
CRODT	<i>Centre de Recherche Oceanographique Dakar/Tiaroye</i>
CRS	Catholic Relief Service
CRTF	United States Coral Reef Task Force
CSS	<i>Compagnie Sucriere Senegalaise</i>
CTE	<i>Controle Technique de L'Etat</i> , Burkina Faso
CUE	Catch Per Unit of Effort
CVGTs	<i>Comité Villageois de Gestion des Terroirs</i>
CWM	Community Wildlife Management
DAC	Development Assistance Committee of the OECD (Organization For Economic Cooperation and Development)
DBH	Diameter Breast Height = (Diametre a Hauteur de Poitrine – DHP)
DBS	<i>Deutsche Bertungsgesellschaft Fur SalinenTechnik</i> , German Consulting Firm, Katwe Salt Works, Uganda
DEAT	Department of Environmental Affairs and Tourism, South Africa
Debswana	De Beers Botswana + Botswana Government
DEF	<i>Direction des Eaux et Forets</i> , Madagascar
DFID	Department for International Development, Great Britain, previously ODA
DFLR:	Democratic Front for the Liberation of Rwanda/Front démocratique pour la libération de Rwanda (FDLR)
DHP	Diametre a Hauteur de Poitrine = DBH, Diameter Breast Height
DGSE	<i>Direction Générale de la Sécurité Extérieure</i>
DHV	Dwars, Heederik en Verhey, Dutch Consulting Firm

DIA	Defense Intelligence Agency, USA
DIN	Dissolved Inorganic Nitrogen = Dissolved (Filterable) [Nitrate (NO_3) + Ammonia]
DME	<i>Diamètre Minimum d'Exploitabilité</i> = Minimal Logging diameter (MLD)
DNA	Deoxyribonucleic Acid
DNFFB	National Forestry and Wildlife Directorate, Mozambique
DOHA	Doha, Qatar where forth World Trade Organization (WTO) talks were held, November 9-13, 2001
DOJ	Department of Justice, USA
DP	Democratic Party
DPOM	<i>Direction de Peche et Oceanographie Maritime, Senegal</i>
DRC	Democratic Republic of Congo, old Zaire
DMA	Division of Management Authority, U.S. Fish and Wildlife Service = OSA
DSA	Division of Scientific Authority, U.S. Fish and Wildlife Service = OMA
DSO	Distinguished Service Order (DSO): a military decoration of the United Kingdom & formerly of other Commonwealth countries, for meritorious or distinguished service by officers of the armed forces during wartime, typically in actual combat
DSS	Decision Support System for organic matter management in soils
DST	<i>Direction la Surveillance du Territoire</i>
DSU	Dispute Settlement Understanding under the World Trade Organization (WTO)
DU	Ducks Unlimited
DWNP	Department of Wildlife and National Parks
DNPWM	Department of National Parks and Wildlife Management, Zimbabwe
EA	Environmental Assessment = EIA
EAWS	East African Wild Life Society
EBA	Everything But Arms, European Union Trade Agreement
EC	European Commission
ECA	UN Economic Commission for Africa

ECOFAC	<i>Programme De Conservation Et Utilisation Des Ecosystèmes Forestiers En Afrique Centrale</i> (ECOFAC)/Program for Conservation and Utilization of Forest Ecosystems in Central Africa
EITI	Extractive Industries Transparency Initiative
EO	Executive Outcomes, private military contractor
EOO	Extent of Occurrence
EUCOM	European Command, U.S. Department of Defense
ECOMOG	Economic Community of West African States Monitoring Group
ECOWAS	Economic Community of West Africa States = CEDEAO in French
ECU	European Currency Unit
EDF	European Development Fund
EIA	Energy Information Administration of the U.S. Department of Energy
EIA	Environmental Impact Assessment = EA
EIA	Environmental Investigation Agency
EIR	Extractive Resources Review
EIS	Environmental Impact Statement
EITI	Extractive Industries Transparency Initiative
EMSL	Environmental Support Laboratory
EPZ	Export Processing Zone
ESKOM	South African electrical company
ESA	Endangered Species Act of the United States
ESAF	Enhanced Structural Adjustment Facility of the International Monetary Fund (IMF)
ESAP	Economic Structural Adjustment Program ≈ Structural Adjustment Program
EU	European Union
EUCOM	European Command of U.S. Department of Defense
F	Fahrenheit
FAC	<i>Fonds d'Aide et de Cooperation</i> , French Fund for Assistance and Cooperation

F _x	F ₁ , F ₂ , etc. Genetic Generations
FAO	Food and Agricultural Organization of the United Nations
FAPC	<i>Forces Armées du Peuple Congolais/</i> People's Armed Forces of Congo in Ituri Forest of the DRC supported by Uganda
FAR	<i>Forces Armées Rwandaises/Rwandese Armed Forces/RAF - Hutu</i>
FAZ	<i>Forces Armées Zaïroises/Zaire Armed Forces</i>
FARA	Forum for Agricultural Research in Africa
FCFA	<i>Franc de la Communauté Africaine</i> , Francophone Africa Currency = CFA – See For Fixed Rates against EURO
FDD	<i>Forces de Defense de la Démocratie /Forces for the Defense of Democracy,</i> Hutu rebel group, Burundi
FDI	Foreign Direct Investment
Fe	Iron
FESP	Forest/Environment Sectoral Program
FFP	Food for Peace
FEWS	Famine Early Warning System
FIDES	<i>Fonds d'Investissements pour le Développement Economique et Social,</i> beginning of French Foreign aid
FIFABE	<i>Fikambanana Fampanddrosoana ny Lemak'I Betsiboka</i> – state run organization controlling impoundments and rice culture in Faritany (Province) of Mahajanga, Madagascar
FLC	<i>Front de Libération du Congo</i> , rebel group northern DRC
FLEC	Front for the Liberation of the Cabinda Enclave – <i>Frente de Libertacao do Enclaave de Cabindauanda</i>
FKNMS	Florida Keys National Marine Sanctuary
FMG	<i>Franc Malagasy</i> , Malagasy Franc – Currency of Madagascar
FNAWS	Foundation for North American Wild Sheep
FMG	Malagasy Franc
FNI	<i>Front des Nationalistes et Intégrationnistes</i> , Lendu ethnic group serving as proxy army in the DRC for Uganda after Uganda pulled out of DRC in 2003

FNLA	<i>Frente Nacional para a Libertaçāo de Angola</i> /National Front for the Liberation of Angola
F.O.B.	Free on Board
FONP/CF	Policy and Institutions Branch of the Forestry Dept./Community Forestry OF THE Forestry Policy and Policy Division of the Forestry Dept., Food and Agricultural Organization (FAO) of the United Nations (UN)
FOREX	Foreign Exchange
FPIF	International Foreign Policy in Focus
FRDC	<i>Front de Résistance pour la Défense du Congo</i>
FRELIMO	<i>Frente de Libertacāo de Moçambique</i>
FRPI	Patriotic Force of Resistance in Ituri (<i>Force de Résistance Patriotique d'Ituri</i>), made up of ethnic Ngiti (Lendu from the south) who operate in areas south of Bunia
FSC	Forest Stewardship Council
FTA	Free-Trade Area/Agreements
FTAA	Free Trade Area of the Americas, expansion of NAFTA
FUC	Front Uni pour le Changement, rebel group trying to overthrow Idriss Déby of Chad
FY	Fiscal Year, runs from October 1 st of previous calendar year and ends on September 30 th of the year for which it is numbered
G7	Major industrial democracies of France, United States, Britain, Germany, Japan, Italy and Canada
G8	G7 + Russia
G20	Developing Countries led by India and Brazil
GAs	Grazing Associations
GAEZ	Global Agro-Ecological Zones
GAIN	Global Agricultural Information Network, of the U.S. Department of Agriculture
GAO	U.S. Government Accountability Office, old: U.S. General Accounting Office
GATT	General Agreement on Tariffs and Trade
GCA	Game Control Area or Game Controlled Area
GCM	General Circulation Model for climate change

GCMRN	Global Coral Reef Monitoring Network
GDF	Global Development Finance
GDP	Gross Domestic Product – BIP, <i>Produit Interieur Brut</i>
GEF	Global Environmental Facility administered by the implementing agencies of the World Bank, UNEP and UNDP
GEPRENAF	<i>Projet de Gestion Participative des Ressources Naturelles et de la Faune</i>
GESAMP	Joint Group of Experts on the Scientific Aspects of Marine Environmental Protection of the United Nations
GFAR	Global Forum for Agricultural Research
GFCC	Gannett Fleming Corddry and Carpenter
GGF	<i>Groupements de Gestion Forestiere</i> , Forestry Management Groups
GHG	Greenhouse Gas
GIS	Geographic Information System
GLASOD	Global Assessment of Soil Degradation
GM	Genetically Modified
GM	General Motors
GMC	Genetically Modified Crop
GMA	Game Management Areas
GMO	Genetically Modified Organism
GNI	Gross National Income = GNP
GNP	Gross National Product = (GDP + NFP) = GNI = Gross National Income
GNP	Garamba National Park
GPA	Global Program of Action for marine pollution
gpd	Gallons per day
GRB	Gambia River Basin
GRN	Namibian Government
GSP	Generalized System of Preferences

GT	<i>Gestion De Terroir</i> – Community Management Of A Territory, Francophone Africa
GTZ	Deutsche Gesellschaft für Technische Zusammenarbeit (German Technical Collaboration), German Donor Agency
GWh	Gigawatt hours One Gwh equals 1 million Kwh
Ha	Hectares
HARZA	American Engineering Company, known for dam building
H ₂ CO ₃	Carbonic Acid
HDI	Human Development Index
HEW	U.S. Department of Health, Education and Welfare. Today, U.S. Department of Health and Human Services
HICs	High-Income Countries
HIV/AIDS	Human Immunodeficiency Virus/Acquired Immunodeficiency Syndrome
HIPC	Heavily Indebted Poor Countries
H ₂ O	Water, water vapor
HUI	Herbivore Use Intensity
HYVs	High-Yielding Varieties
IBRD	International Bank for Reconstruction and Development, part of World Bank along with IDA (International Development Association)
ICARDA	International Centre for Agricultural Research in Dry Areas
ICASALS	International Center for Arid and Semiarid Land Studies, Texas Tech University
ICC	International Criminal Court
ICD	Integrated Conservation and Development
ICDPs	Integrated Conservation and Development Projects
ICG	International Crisis Group
ICIJ	International Consortium of Investigative Journalists
ICO	International Coffee Organization
ICRAF	International Centre for Research in Agroforestry
ICRAN	International Reef Action Network

ICRI	International Coral Reef Initiative
ICRISAT	International Crops Research Institute for the Semi-Arid Tropics
IDA	International Development Association, part of the World Bank along with IBRD
IDEN	Integrated Development of the Eastern Nile project
IDEP	The United Nations African Institute for Economic Development and Planning, Headquartered in Dakar Senegal
IDP	Internally Displaced Persons
IEA	International Energy Agency
IFA	International Fertilizer Industry Association
IFAD	International Fund for Agricultural Development of the United Nations
IFAW	International Fund for Animal Welfare
IFC	International Finance Corporation of the World Bank
IFCP	Impenetrable Forest Conservation Project, Bwindi, Uganda
IFIs	International Financial Institutions
IFPRI	International Food Policy Research Institute
IGAD	Intergovernmental Authority for Development
IGFR	Institute for Global Futures Research
IGN	Institut Géographique National, French public state administrative establishment, produces & maintains geographical information for France, its overseas departments and territories
IGR	International Grains Council
IIED	International Institute for Environment and Development
IITA	International Institute of Tropical Agriculture
IKEA	International Franchise for home furnishings
ILC	Inland Logging Company
ILCA	International Livestock Center for Africa
ILO	International Labor Organization

IMC	International Marketing Council of South Africa
IMET	International Military Education and Training
IMF	International Monetary Fund
INE	National Ecology Institute, Mexico
INM	Integrated Nutrient Management
IPACC	Indigenous Peoples of Africa Coordinating Committee of the ACHPR (African Commission on Human and Peoples' Rights)
IPCC	Intergovernmental Panel On Climate Change
IPRI	International Peace Research Institute, Oslo, Norway
IPT	Intermittent Preventive Treatment
IRC	International Resource Center
IRD	<i>Institut de Recherche pour le Développement</i> , France
IRIN	United Nations Office for the Coordination of Humanitarian Affairs (OCHA) Integrated Regional Information Network (IRIN).
IRN	International Rivers Network
IRRI	International Rice Research Institute
IRZ	Institute of Animal Research, Cameroon
IS	Institute for Policy Studies, also IPS
ISFM	Integrated Soil Fertility Management
ISRA	Institut Senegalais de Recherches Agricoles
ISRIC	International Soil and Reference Information Center
IT	Information Technology
ITCZ	Inter-Tropical Convergence Zone ITCZ
ITE	Interactive Telematic Education
ITN	Insecticide Treated (Bed) Nets
ITTO	International Tropical Timber Organization
IUCN	International Union for the Conservation of Nature = World Conservation Union
IWRM	Integrated Water Resources Management

JECOR	United States-Saudi Arabian Joint Economic Commission
JEM	Justice and Equality Movement, Rebel Group Darfur, Sudan
JUKUMU	<i>Jumuiya ya Kuhifadhi Mazingira Ukutu</i> (Society for Conservation and Wise Use of Natural Resources in the Ukutu Area, Tanzania)
K	Potassium
K	Kwacha, Zambian Currency
KAS	Private Military Contractor/Mercenary group based out of England
KNP	Kahuzi-Biega National Park
KCS	Kalahari Conservation Society
KFA	Kenya Farmers' Association
KFW	German Development Bank
Kg	Kilogram
Km	Kilometers
KNCS	Kwazulu Natal Nature Conservation Service
KNP	Kruger National Park
KPCS	Kimberley Process Certification Scheme, Diamonds
KPNR	Klaserie Private Nature Reserve
KWC	Kenya Wildlife Coalition, animal rights NGO
Kwh	kilowatt hour equal a 1,000 watt light bulb for one hour
KWS	Kenya Wildlife Service
KWWG	Kenya Wildlife Working Group
KY	<i>Kabaka Yekka</i> party or "The King Alone" party, Uganda
LC's	Local Councils old RC's, Uganda
LCCs	Local Conservation Committees, Uganda
LDC	Least Developed Countries, Less Developed Countries
LEAT	Lawyers Environmental Action Team, Tanzania
LEI	Low-External Input

LGRP	Local Government Reform Program
LHDA	Lesotho Highlands Development Authority
LHWP	Lesotho Highlands Water Project
LICs	Low Income Countries
LIFE	Namibia "Living in a Finite Environment"
LIRD ^P	Luangwa Integrated Resources Development Program
LISA	Low Mineral Input Sustainable Agriculture
LMGR	Lake Mburo Game Reserve
LMICs	Lower Middle-Income Countries
LMNP	Lake Mburo National Park
LRA	Lord's Resistance Army, Uganda
LRDC	Consulting Firm, undertook agricultural study around Balingho Anti-Salinity Barrage the Gambia in 1984
LWAG	Livestock and Wildlife Advisory Group of Department for International Development (DFID)
LONRHO	London Rhodesia Company
LTD	Limited
LURD	Liberians United for Reconciliation and Democracy
m	Meter
MAB	U.S. Man and the Biosphere Program
MAI	Multilateral Agreement on Investment
MBD	Million Barrels Per Day
MBIFCT	Mgahinga Bwindi Impenetrable Forest Conservation Trust
MC	Military Cross (MC): third level military decoration awarded to officers & since 1993 other ranks of the British Army & formerly to officers of other Commonwealth countries
MCF	Malignant Catarrhal Fever
MDB	Multinational Development Banks

MDC	Movement for Democratic Change
MEA	Multilateral Environmental Agreement
MEF	Ministry of Environment and Forests, Congo Brazzaville
MEI	Morpho-Edaphic Index
MEND	Movement for the Emancipation of the Niger Delta
MET	Ministry of Environment and Tourism, Namibia
MFN	Most Favored Nation, EU Everything But Arms trade agreement
MGD	Million Gallons Per Day
mi.	Mile
MIKE	Monitoring Of Illegally Killed Elephants program of CITES
MINEF	<i>Ministere de la Environment et Forets</i> , Ministry of Environment and Forests
MINURSO	<i>Mission des Nations Unies Pour l'Organisation d'Un Referendum Au Sahara Occidental/ United Nations Mission for the Referendum in Western Sahara</i>
MIT	Massachusetts Institute of Technology
MLD	Minimal Logging diameter = <i>Diamètre Minimum d'Exploitabilité</i> (DME)
mm	Millimeters
MNCs	Multi-National Corporations = MNEs = TNCs
MNEs	Multi-National Enterprises = MNCs = TNCs
MNP	Netherlands Environmental Assessment Agency
MNRT	Ministry of Natural Resources and Tourism
MODEL	Movement for Democracy in Liberia
MONUC	<i>Mission de l'Organisation des Nations Unies en République Démocratique du Congo</i>
MOU	Memorandum of Understanding
MP	Member of Parliament
MPA	Marine Protected Area
MPLA	<i>Movimento Popular da Libertaçao de Angloa</i> /Popular Movement for the Liberation of Angola

MPRI	Military Professional Resources Inc., private military contractor
MRND	<i>Mouvement Révolutionnaire National pour le Développement/National Revolutionary Movement for Development</i> , Rwanda – Hutu Party with power base in north
M.S.	Masters of Science
MSL	Mean Sea Level
MSY	Maximum Sustained Yield
MT	Metric Tons
MUIENR	Makerere University Institute of Environment and Natural Resources, Uganda
MW	Mega Watts
MWPI	Maryland Wood Processing Industries in Liberia
N	Nitrogen
NAAEC	North American Agreement on Environmental Cooperation
NaCl	Sodium Chloride, Salt
NACSO	Namibian Association of CBNRM Support Organizations
NADB	North American Development Bank
NAFTA	North American Free Trade Agreement
NAMA	Non-Agricultural Market Access
NAMC	The National Agricultural Marketing Council, South Africa
NAPF	North American Pronghorn Foundation
NARS	National Agricultural Research Systems
NAS	Nation Academy of Sciences
NASREC	Convention Center, Johannesburg, South Africa where WSSD held
NBI	Nile Basin Initiative
NBP	Northern Basalt Plains
\$ND	Namibian Dollar
NDA	National Democratic Alliance, Uganda
NEPAD	New Partnership for Africa's Development

NFP	Net Factor Payments
NIF	National Islamic Front, Sudan
NG NGO	Ngamiland, Botswana (hunting tourism blocks) Non-Governmental Organization
NIPHE	National Institute of Public Health and the Environment of the Netherlands
NIS	New Independent States of the former Soviet Union
NNP	Nouabalé-Ndoki National Park, Congo
N ₂ O	Nitrous Oxide
NOAA	National Oceanic & Atmospheric Administration, U.S. Department of Commerce
NORAD	Norwegian Agency for International Development
NP	National Park
NPB	Natal Parks Board now KwaZulu-Natal Wildlife
NPAD	National Policy on Agricultural Development, Botswana
NPFL	National Patriotic Front of Liberia
NPK	Nitrogen, Phosphorous and Potassium Fertilizer = N/P/K
NPWS	National Parks and Wildlife Service
NRA	National Resistance Army, Uganda
NRDC	Natural Resources Defense Council
NRM	Natural Resources Management
NRM	National Resistance Movement
NRMP	Natural Resources Management Program
NSA	National Security Agency, USA
NTFP	Non-Timber Forest Products, often called Minor Forest Products
NTTA	Netherlands Timber Trade Association replaced Kerhout Foundation
NWTF	National Wild Turkey Foundation
OA	Official Aid
OAU	Organization of African Union

OCFSA	Organization for the Conservation of African Wildlife
OCHA	United Nations Office for the Coordination of Humanitarian Affairs
ODA	British Overseas Development Administration, now called DEFID
ODA	Official Development Assistance = Foreign Aid
ODF	Official Development Finance
ODM	Orange Democratic Movement, Kenya
OED	Operations Evaluation Department, World Bank: IBRD/IDA
OECD	Organization for Economic Cooperation and Development
OFR	Okapi Faunal Reserve
OMA	Office of Management Authority
OMV	Australian Oil Company
OMVG	Gambia River Basin Development Organization/ <i>Organisation pour la Mise en Valeur du Fleuve Gambie</i>
OMVS	<i>Organisation Pour la Mise en Valeur du Fleuve Sénégal/Senegal River Basin</i> Development Organization
ONCAD	<i>Office National pour la Commercialization Agricole et du Developpement</i> , the National Agricultural Marketing Board of Senegal
OOF	Other Official Flows
OPC	Other Private Capital
OPEC	Organization of the Petroleum Exporting Countries
ORI	Oceanographic Research Institute
ORSTOM	<i>Office de la Recherche Scientifique et Technique Outre-Mer</i> now CIRAD
OSA	Office of Scientific Authority
OSLEC	Operation Sovereign Legitimacy
OTC	Oriental Timber Company in Liberia
OVI	Onderstepoort, Veterinary Institute, South Africa
OXFAM	International Development, Relief and Human Rights Watch Dog NGO
P	Phosphorous

PA	Protected Area
PAC	Problem Animal Control
PAGEN	<i>Projet de Partenariat Pour la Amelioration de la Gestion des Ecosystems Naturels</i> - Partner For Improvement of Management Of Natural Ecosystems, Burkina Faso
PARMEHUTU	<i>Parti du Mouvement et de l'Emmancipation Hutu</i> /Party of the Movement of Emancipation of the Bahutu
PC	Popular Congress, old Popular National Congress of Hassan el-Turabi, Sudan
PDL	Poverty Datum Line, living on < \$US 1/day
PETA	People for the Ethical Treatment of Animals
PFC	Energy Consulting Firm
pH	Measurement of acidity
PHASA	Professional Hunters Association of South Africa
PHAZ	Professional Hunters Association of Zambia
PIV	<i>Périmètres Irrigués Villageois</i> /Villager Irrigated Perimeters
PL480	Public Law 480 “Food for Peace” of the United States
PMACs	Park Management Advisory Committees, Uganda
PMCs	Private Military Companies/Contractors
PNU	Party of National Unity, Kenya
PO	Pastoral Organizations
PPCP	Public, Private Community Partnership
PPMV	Parts Per Million by Volume
PPT	Parts Per Thousand
PR	Phosphate Rock
PRA	People's Redemption Army, Uganda
PRASET	<i>Projet Regional d'Appui au Secteur de l'Elevage Transhumant</i>
PRMCs	Parish Resource Management Committees, Uganda
PROFEPA	Office of the Attorney General for Environmental Protection, Mexico

PRONAGEN	National Natural Ecosystem Management Program
PRSPs	Poverty Reduction Strategy Papers of IMF and World Bank
PSC	Private Sector Conservation
PSE	Producer Subsidy Equivalent/ Producer Support Estimate
%PSE	Percent Producer Subsidy Equivalent/Percent Producer Support Estimate
PUE	<i>Prises Par Unité d'Effort</i> = Catch Per Unit of Effort - CUE
PUSIC	Party for Unity and Safeguarding of the Integrity of Congo/ <i>Parti pour l'unité et la sauvegarde de l'intégrité du Congo</i>
QENP	Queen Elizabeth National Park
QR	Quantitative Restrictions
RADER	<i>Rassemblement Démocratique Rwandaise/Rwandan Democratic Rally/Assembly</i>
RADs	Remote Area Dwellers
RADS	Remote Area Dweller Settlements
RAF	Rwandese Armed Forces = <i>Forces Armées Rwandaises/FAR</i> - Hutu
RAMSAR	International Convention on Wetlands or the “Ramsar Convention” signed in Ramsar, Iran
RC's	Resistance Committees/Councils, Uganda – now Local Councils
RCA	<i>République Centrale Africaine</i> = Central African Republic (CAR) in English
RCD-Goma	Congolese Rally for Democracy/ <i>Rassemblement Congolais pour la Démocratie – National</i> , Rwandan backed fighting in DRC
RCD-ML	Congolese Rally for Democracy – Liberation Movement/ <i>Rassemblement Congolais pour la Démocratie – Mouvement de Libération</i> (RCD-ML) Beni in North Kivu in theory integrated into DRC transitional government
RCD-National	Congolese Rally for Democracy-National/ <i>Rassemblement Congolais pour la Démocratie - National</i> in Isiro and Watsa of northeast in theory integrated into DRC transitional government.
RandD	Research and Development
RDA	Recommended Daily Allowance (Nutrition)
RDC	Rural District Council

RDR	<i>Rassemblement Democratique pour la Retour</i> , old Hutu FAR reassembled in the DRC
RENAMO	<i>Resistència National Moçambicana</i>
RMAs	Range Management Areas
RMC	Resource Management Committees
RMEF	Rocky Mountain Elk Foundation
RENAMO	<i>Resistència National Moçambicana</i>
RMNP	Rwenzori Mountains National Park “Mountains of the Moon,” Uganda
RMS	Rwenzori Mountaineering Services, Indigenous Mountain Climbing and Backpacking Service, Uganda
RONCO	American Consulting Firm and Private Military Contractor (PMC)
ROSA	Regional Office, Southern Africa, of International Union for the Conservation Of Nature (IUCN)= World Conservation Union
RPF	Rwandan Patriotic Front – Tutsi under Kagame
RSA	Republic of South Africa
RUF	Revolutionary United Front rebels, Sierra Leone
RWS	Rurambira Wildlife Society, Uganda
S.A.	South Africa
SACCAR	Southern Africa Centre for Cooperation in Agricultural Research and Training
SACU	Southern African Customs Union
SADC	Southern African Development Community
SADCC	Southern African Co-ordination Conference, now SADC
SAED	<i>Société d'Aménagement et d'Exploitation des Terres du Delta du Fleuve Sénégal</i>
SALs	Structural Adjustment Loans
SANParks	South African National Parks
SAP	Structural Adjustment Policies ≈ ESAP, Economic Structural Adjustment Program
SARPO	Southern African Regional Program Office of WWF

SARS	Severe Acute Respiratory Syndrome, a viral respiratory illness caused by a corona virus
SAS	Special Air Service, Britain
SASUSG	Southern Africa Sustainable Use Specialist Group, IUCN – The World Conservation Union Regional Office for Southern Africa
SAWEG	The Sahelian Wetlands Expert Group
SCAC	Service de Cooperation et d'Action Culturelle
SCI	Safari Club International, international hunting and conservation body
SCIP	Support For Community-Initiated Projects
SCOA	<i>Société Commerciale Ouest Africaine</i>
SCP	Selous Conservation Program
SCUBA	Self-Contained Underwater Breathing Apparatus
SDR	Special Drawing Rights, used by International Monetary Fund to determine exchange rates
Sec	Second
SEMARNAP	Secretariat of the Environment, Natural Resources, and Fisheries, Mexico
SEMRY	<i>Secteur Expérimental de Modernisation de Riziculture de Yagoua</i> , Rice Perimeters, Extreme North, Cameroon
SEMNORD	<i>Secteur Expérimental de Modernization du Nord</i> , Cameroon
SFI	Soil Fertility Initiative of the World Bank
SFV	Simian Foamy Virus
SGR	Selous Game Reserve
SIDA	Swedish International Development Agency
SIP	<i>Société Indigènes de Prévoyances</i>
SIS	British Secret Intelligence Service
SIV	Simian Immunodeficiency Virus
SLM/A	Sudan Liberation Movement/Army, Darfur, Sudan
S & L	Savings and Loans
SLA	Sudan Liberation Army, Darfur, Sudan

SNA	System of National Accounts
SNPC	Société Nationale des Pétroles du Congo
SNV	<i>Service National des Vocations, France</i>
SOCEBO	<i>Société Congolaise d'Exploitation Du Bois</i>
SODICOTON	French/Cameroon Government owned cotton company using small farmers to cultivate around the parks of Bénoué, Faro and Bouba-Njida, North Province, Cameroon
SOGREAH	<i>Société Grenobloise d'Etudes et d'Applications Hydrauliques</i> , French Consulting Firm
SOM	Soil Organic Matter
SONEX	RCD-Goma's financial arm, rebel group in DRC
SNPC	<i>Société Nationale des Pétroles du Congo</i> , State Oil Company, Congo Brazzaville
SPA	Protected Areas
SPFS	Special Program for Food Security of the FAO
SPLA	Sudan People's Liberation Army, John Garang, Southern Sudan
SPLM	Sudan People's Liberation Movement, John Garang, Southern Sudan
SRB	Senegal River Basin
SRBMA	Senegal River Basin Monitoring Activity
SRF	Systematic Reconnaissance Flight Technique
SRO	Strengthening Agricultural Research
SRP	Soluble Reactive Phosphorus = Dissolved (Filterable) Orthophosphate
SSA	Sub-Saharan Africa
SSARR	Streamflow Synthesis and Reservoir Regulation
SSC	Species Survival Commission of the International Union for the Conservation of Nature = World Conservation Union
SSDF	South Sudan Defense Forces, Pro-Government
SSG	Special Safeguard Measures, trade
SST	Sea-Surface Temperature

SR-52	Genetically Modified (GM) Maize, Zimbabwe
SVF	Simian Foamy Virus
SWAPO	Southwest Africa People's Organization
TA	Tribal Authority
TAL	Transoceanic abort landing sites for the Space Shuttle
TANAPA	Tanzania National Parks
TAWICO	Tanzania Wildlife Corporation
TAWIRI	Tanzania Wildlife Research Institute, Arusha, Tanzania
TB	Tuberculosis
TCI	Trade Competitiveness Index
TDCA	Trade, Development and Cooperation Agreement – with European Union
TDS	Total Dissolved Solids
TED	Trade Environment Database, American University
TEK	Traditional Ecological Knowledge
TFCA's	Transfrontier Conservation Areas
TFCS	Turkana Fishermen's Cooperative
TGLP	Botswana, Tribal Grazing and Land Policy of 1975
TGT	Tanzania Game Trackers
TLU	Tropical Livestock Units
TNA	Tanzania National Archives
TNC	The Nature Conservancy
TNCs	Transnational Corporations = MNCs = MNEs
TNP	Tarangire National Park
TRAFFIC	Trade Records Analysis of Flora and Fauna in International Commerce
TRIDOM	Dja-Boumba Bek-Nki-Odzala-Minkébé transfrontier reserve between Cameroon, Congo Brazzaville and Gabon funded by Global Environmental Facility (GEF)

TRT	<i>Thyssen Rheinstahltechnik GmbH</i> , German Consulting Co., Katwe Salt Works, Uganda
TSBF	Tropical Soil Biology and Fertility Program
TSCTI	Trans-Sahara Counterterrorism Initiative
TSE	Total Support Estimate
TSH	Tourist Safari Hunting
TTL	Tribal Trust Lands, Zimbabwe
TUT	Tshwane University of Technology, South Africa
TVA	Tennessee Valley Authority
UAC	United African Corporation, owned by Margaret Kenyatta, linked to illegal ivory sales
UAF	<i>Unite d'Aménagement Forestier</i> , Forest block
UFA	<i>Unités Forestières d'Aménagement</i> , Commercial forest block
UCLA	University of Los Angeles, California
UCMP	University of California, Berkeley, Museum of Paleontology
UDC	Uganda Development Corporation
UDI	Unilateral Declaration of Independence, Zimbabwe
UGGF	<i>L'Union Des Groupement De Gestion Forestiere</i> = Union of Forestry Management Groups
UFA	<i>Unités Forestières d'Aménagement</i>
UK	United Kingdom
UMICs	Upper Middle-Income Countries
UN	United Nations
UNAIDS	Joint United Nations Program on HIV/AIDS
UNAMIR	United Nations Assistance Mission in Rwanda
UNAMSIL	United Nations Mission in Sierra Leone
UNAR	<i>Union Nationale Rwandaise</i> /Rwandan National Union
UNCHS	United Nations Centre for Human Settlements - Habitat

UNCTAD	United Nations Conference on Trade and Development
UNDP	United Nations Development Program
UNECA	United Nations Economic Commission for Africa
UNECLAC	Economic Commission for Latin America and the Caribbean, United Nations Environment Program
UNEP	United Nations Environmental Program
UNESCO	United Nations Educational, Scientific and Cultural Organization
UNHCR	United Nations High Commission for Refugees
UNIP	United National Independence Party, Zambia
UNITA	<i>União Nacional Para a Independência Total de Angola/</i> National Union for the Total Independence of Angola
UNMEE	United Nations Mission in Ethiopia and Eritrea
UNMIL	United Nations Mission in Liberia
UNOCAL	American-based oil company
UNP	Uganda National Parks. Combined with Game department to form today's Uganda Wildlife Authority (UWA)
UNRF	Uganda National Rescue/Resistance Front, Uganda
UNSC	United Nations Security Council
UPC	Uganda People's Congress
UPC	<i>Union des Patriotes Congolais</i> , Hema ethic group serving as proxy army in DRC for Rwanda after Rwanda pulled out of DRC
UPDF	Ugandan People's Defense Forces
UPRONA	<i>Unité Pour le Progrès National</i> /Party of National Unity and Progress
U.S. & USA	United States of America
USAID	United States Agency for International Development
USBC	U.S. Bureau of the Census
USDA	United States Department of Agriculture
USDTA	U.S. Trade and Development Agency
USEPA	U.S. Environmental Protection Agency

USFWS	U.S. Fish and Wildlife Service = USF&WS
USGS	United States Geological Survey
USH	Uganda Shillings
USITC	United States International Trade Commission
USMCOC	United States Mexican Chamber of Commerce
USSR	Union of Soviet Socialist Republics
USTR	U.S. Trade Representative
UWA	Uganda Wildlife Authority
VA	Village Assembly, Tanzania
VAGs	Village Action Groups, Zambia
VC	Village Council, Tanzania
VC	Victoria Cross (VC): highest recognition for valor "in the face of the enemy" awarded to members of British & Commonwealth forces of any rank in any service, and civilians under military command.
WFP	World Food Program
VIDCOs	Village Development Committees, Zimbabwe
VIF	Village Investment Funds, Burkina Faso
VNP	Virungas National Park
VOA	Voice of America
VITA	Volunteers in Technical Assistance
VX	Nerve Gas
WADCO	Ward Development Committee, Zimbabwe
WASP	White Anglo-Saxon Protestant
WCD	World Commission on Dams
WCMC	World Conservation Monitoring Center
WCPA	World Commission on Protected Areas of the IUCN
WCS	Wildlife Conservation Society of the New York Zoological Society

WCU	Wildlife Conservation Unit, Burkina Faso
WCU	World Conservation Union
WD	Wildlife Division, Tanzania
WDM	World Development Movement NGO
WECARD	West and Central African Council for Agricultural Research and Development = CORAF in French
WFA	World Food Summit
WFP	World Food Program
WHO	World Health Organization

Figure 7.7: Kapenta fishing rigs on the Cahora Bassa Reservoir, Mozambique

In 1959, this large *Colpophyllia natans* (giant brain coral) was healthy and intact.

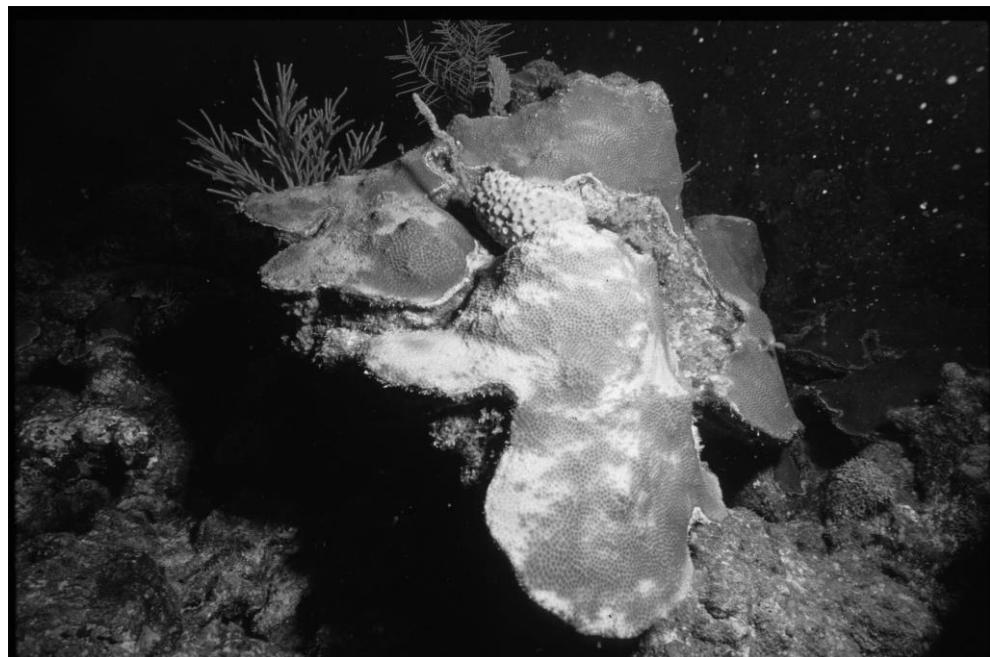

In 1988, following Hurricane Donna of 1960, the giant brain coral is still healthy.

By the summer of 1998, most of the giant brain coral is dead and covered with epiphytic (benthic) algae and sea whips (Gorgonian corals).
